BEST & DRIVER'S IMPROVED COMBINED HARVESTER for 1887

Manufactured at the

DANIEL BEST AGRICULTURAL WORKS, San Leandro, Cal.

STANDARD SIZE —IS— 14 Feet.

Will make any size that is ordered.

Belt —AND— Geared.

The BEST & DRIVER IMPROVED Combined Harvester, without doubt, will be the Leading Machine this season, is the verdict of all those who have inspected it.

IT HA VALUABLE IMPROVEMENTS THAT ARE NOT FOUND IN ANY OTHER COMBINED HARVESTER MANUFACTURED. SPACE WILL NOT ALLOW US TO ENUMERATE HERE; AN INSPECTION OF THE MACHINE WILL CONVINCE YOU.

The Gearing is composed mostly of Spur Wheels, and so compactly arranged that should the frame of the machine weave because of the unevenness of the ground, there would be no danger of the gearing getting out of line, causing it to cut or bind in the boxes, which occurs with other Harvesters in which the gearing is more scattered.

We have succeeded in getting that combination of Lightness, Adaptability and Strength which is the result of thought and skill, taking from some parts and adding to others, making our Harvester from four to six horses lighter draft, and yet retaining as great strength as the heavest machine manufactured. The Header is very rigid and so balanced and hinged that it is no trouole to save down and tangled grain. A boy ten years of age can manage it.

I wish to call your attention particularly to the separating qualities of my Harvester. The agitators are so arranged that the grain is completely shaken from the straw, and my new AUTOMATIC GOVERNOR on the fan completely governs the blast on the shoe, so that at any speed which the machine travels, the blast will be the same. Making a saving of a great amount of grain that would otherwise be blown over the riddles; but, instead, will go into the sack, which in a season will more than pay the harvestin expenses, over and above any **Combined Harvester** that has not the **Automatic Governor.**

Each **Harvester** has one of my celebrated **Grain Cleaners** ttached, which needs no recommendation from me, as the grain growers of California can testify as to its merits and superiority over other Cleaners on the Coast.

Every machine is thoroughly tested before it is allowed to leave the factory, so there will be no trouble or vexatious delays in the field. The Lumber is thoroughly kiln dried that we use in the construction of our Harvesters, so that they will not fall to pieces under a hot sun.

Write for Circulars. For further information, prices, etc., address

Please call at my Works, near the Depot, San Leandro, and examine our Harvester. I have sample machine belted and attached to the power of the factory, and will take pleasure in showing how t works, so that you can become familiar with the working of the machine before taking it into the field.

IMPROVED GRAIN CLEANERS, and MILLS.

I desire to call your attention to my latest Improved Cleaners that I make for any and all Combined Harvesters. The great success I have had with my Cleaners, made to run with Thrashing Machines, as well as the satisfaction given by my Fanning Mill and Warehouse Mill, induced me to design and build a Cleaner, especially for the Combined Harvesters. I make the following sizes, viz:

45-inch for 18-foot cut and over.
40-inch for 14 to 18-foot cut.

This Cleaner is the most successful Combined Harvester Cleaner ever offered to the public, and I can guarantee it to be the most perfect Cleaner now in use. I have made a great many valuable improvements that have never yet been introduced, the merits of which will be quickly understood and highly appreciated by those who have use for the Cleaner. It is made strong and durable, and of such size and capacity that it will easily handle and thoroughly cl an the grain as fast as any Combined Harvester will thrash it, and it has proven to be the only Cleaner mounted on Harvesters, that will thoroughly clean foul grain, and make it merchantable.

DANIEL BEST, San Leandro, Alameda Co., Cal.

Santa Clara Valley Real Estate

Space allows us to Show but a few Choice Investments from our larger list of bargains:

$2150—10 acres, 3 miles from town. Rich gravelly loam; all in vines, 2 years old. Small house, shed, barn and well. Unimproved land adjoining sold for $200 per acre. No. 450.

$25,000—55 acres, adjoining city; suitable for subdividing; modern cottage, hot and cold water; city water and barn; 8 acres in choice orchard; vacant land adjoining, selling at $1000 per acre; very choice investment. No. 448.

$16,000—40 acres in warm belt near Saratoga; modern house with all improvements, good barn, well, windmill and tank; 23 acres best variety grapes, bearing; balance prune orchard. A bargain. No. 426.

$9000—30 acres; fine location, 2½ miles from city; fine 10-room house, barn and windmill; 5 acres orchard and 5 acres vineyard; a beautiful home; rapidly increasing in value. No. 484.

$5000—8 acres; choice bearing orchard; 1 mile from San Jose; 7 acres prunes; balance variety; neat 4-room house; stable and well; few vines. No. 460.

$15,000—60 acres; finely located, 6 miles out, near R. R.; 50 acres in choice orchard and vineyard; 20 acres bearing; nice house, barn, large tank, etc.; fine lawn, shrubbery, hedges, etc. The best bargain in the valley. A beautiful, productive home. No. 102.

$225 per acre.—80 acres choice alluvial land; 1 mile from city limits; as a whole or in subdivisions; a fine speculation; $225 per acre in subdivisions, less as a whole. Investigate this. No. 482.

$400 per acre.—12 acres close to city limits; rich sediment soil; suitable for subdividing into suburban lots; only $400 per acre, well worth $600. No. 489.

$25,000—129 acres, within 3 miles of town; rich soil; 30 acres vines; 15 acres apricots, prunes, etc.; two-story house, barn, windmill, tank, water pipes; splendid location in warm belt. Only $10,000 cash, balance 8 per cent. No. 457.

$9500—22 acres in beautiful location; neat cottage, good barn and carriage house, chicken house, poultry yards for 1000 chickens, good well, windmill and tank; splendid variety orchard, principally prunes and apricots; some oranges, lemons, limes, almonds and olives; also small fruit; terms easy; will exchange for Oakland property. No. 410.

$1500—160 acres; a cheap foothill ranch; part in orchard and vines; small house and barn; plenty of water; apply soon. No. 411.

$4400—10 acres; 4-year-old orchard, 2 miles from Santa Clara; well fenced; principally prunes and apricots; combination house and barn; cheap. No. 415.

60 acres; splendid sediment land, beautifully located on two avenues; to be sold in tracts to suit, from ten acres upward; price very low, according to location. No. 420.

$3000—A very choice 3-acre orchard, with house, barn, windmill, tank, tankhouse, etc.; very near the horse cars, in the celebrated Willows tract; a rare chance; this piece produced about $600 last year. No. 423.

$1250—Very desirable lot opposite the Normal school. No. 40.

$4000—16 acres; short distance from town, on main avenue; all in best variety orchard; a paying investment. No. 346.

$8000—32 acres, fronting on beautiful avenue; 3 acres bearing vines; 12 acres prunes; neat house; 2 story, good barn; all fenced; terms, half cash; balance on or before 3 years, 8 per cent; a bargain. No. 493.

$900—Lot 70x200, in University survey; small house and orchard; very desirable property and a bargain. No. 133.

$1200—About 2 acres splendid land; small house, good well, small orchard and vineyard; commands a beautiful view; in north part of city; fronts two streets. No. 128.

$225 per acre; 115 acres finely located, adjoining town; 16 acres good orchard, 4 and 5 years old; house, fine well, windmill, tank, barn; a desirable purchase; land next to it selling at $400 per acre; in tracts to suit. No. 477.

$175 per acre; 235 acres rich sediment land, only 2½ miles from town; lying on 2 avenues; can be advantageously subdivided at good advance. No. 483.

$43,500—320 acres 2 miles from town; modern house, 2 large barns, well, windmill and tank; 250 acres in paying crops, balance pasture; do not miss this chance; splendid land, and below market price; fine for subdivision. No. 478.

$2500—20 acres, all in vines, in a beautiful location in foothills, overlooking the valley; good soil and cheap. No. 481.

Correspondence promptly answered. Property shown free, having our own conveyances. We deal on the square and furnish

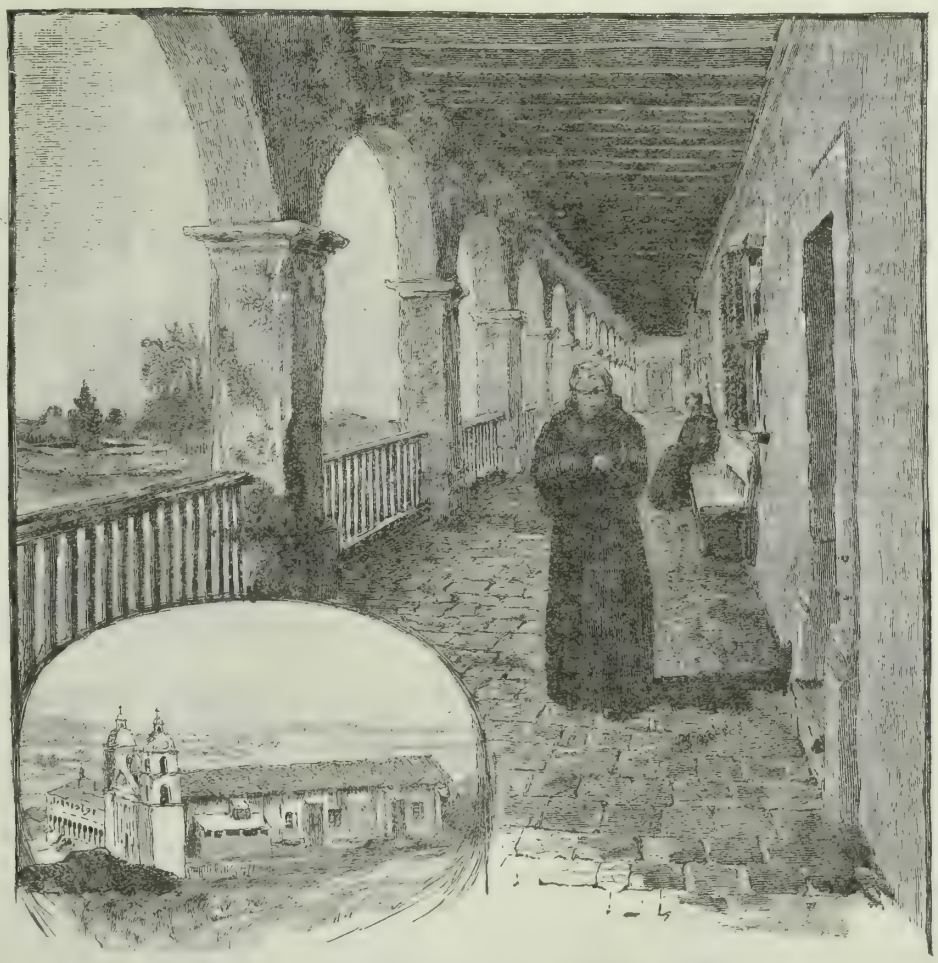
PACIFIC RURAL PRESS

TWENTY-FOUR PAGE EDITION.

Vol. XXXIII.—No. 13. SAN FRANCISCO, SATURDAY, MARCH 26, 1887. $3 a Year, in Advance. Single Copies, 10 Cts.



The Forty-ninth Congress.

Opinions may differ, but the general legislation of this Congress seems to be more than usually fruitful. We judge its work, not by the quantity accomplished, but the quality. The RURAL has fully amplified the Interstate Commerce bill, the Oleomargarine and Agricultural Experiment Station bills; but a summary of the other more important work may be refreshing to the memory of many. In passing the Electoral-Count bill, a danger liable to occur under the old system of presidential elections has been eliminated by fixing the succession so that no contingency can affect it. Acts have been passed extending the jurisdiction of the Court of Claims, introducing the free-delivery system into cities of 10,000 inhabitants and relieving our merchant marine of some vexatious burdens. The use of convict labor on public buildings has been prohibited, and provision made for the redemption of trade dollars. The Tenure of Office Act has been repealed. The area of pensions has been materially increased by the passage of the Mexican Pension bill, a measure about which there will be contrarious opinions. The Anti-Mormon bill has been allowed by the President to become a law, and promises, if rigidly enforced, to solve the Mormon problem, by breaking down the political power of the Mormon church, in abolishing what is called woman suf-suffrage, but in this Territory should be called concubine suffrage, and restoring the control of the Territory to the people operating through Congress, where it belongs. The Act restricting the ownership of real estate in the Territories to American citizens will be hailed with general favor. It appears from the report of a Congressional committee that about 20,000,000 acres of land are now owned by aliens—an area more than equal to one-third of the State of Kansas. It is certainly not desirable that any considerable tracts of land should pass into the hands of persons more interested in the welfare of another country than the one that gives them the hospitality of a home and shelter—persons who owe allegiance abroad and never care to participate in advancing the glory and prosperity of our country. The naval appropriation seems generous. It will carry a total of $18,000,000 toward the new navy, of which $1,110,000 is for two steel gunboats, $6,000,000 for two heavily armored cruisers, $2,000,000 for floating batteries, $50,000 for torpedoes, $4,000,000 for armor-plate and gun steel, $2,000,000 for work on monitors, and $2,500,000 for work on vessels already begun.

This will make a good start toward a navy, but the fortification of the seaboard was strangely neglected. Congress has at last spoken out in no mincing words in the matter of the Canadian outrages upon our fishermen and fishery interests by passing a bill which authorizes the President to close our ports against Canadian vessels and goods in case of further interference with fishing marine, and render liable to forfeiture all vessels violating the presidential proclamation. On the whole, Congress has done pretty well.

Santa Barbara Mission.

We give on this page a sketch of the Old Mission church at Santa Barbara. Now that Santa Barbara is feeling the effect of the new life in California affairs, as the long-desired railway is approaching the town, and varied city improvements are rife, it is worth while for a moment to turn the mind upon the vestige of the old life of the place. The Santa Barbara mission recently passed its centennial birthday, as it was established in 1786. In the small engraving at the lower corner is given a glimpse of the general form of the building. The main structure is 200 feet in length and nearly 50 feet in width, and the wing is 130 feet long. It is upon the corridor of this wing that the main sketch is made, and the figure is a Franciscan monk. Santa Barbara mission is the only one, it is said, where the Franciscan monks still remain. The grounds of the Mission are spacious, and a ride to the spot is the proper thing for tourists visiting the city by the sea.

THE OLD MISSION CHURCH AT SANTA BARBARA.

THE RUINOUS RABBITS.—The Adelaide *Observer*, of Feb. 19th, had a telegram from Sydney, stating that the contractor for the erection of a rabbit-proof fence between Narromine and Bourke had only 25 miles of fencing to finish, and was expecting to complete his contract in about a fortnight. Signs of rabbits had been found in several places to the northward of the fence, and it was feared that the erection of the barrier has been too long delayed, and that additional fencing will have to be erected on an extensive scale, in order effectively to check their advance northward and eastward. Great numbers of rabbits are being destroyed in the southwestern pastoral country, no less than 250,000 having been killed on one station during the last quarter of 1886. Those uninformed persons, who were inclined to sneer at the alarm caused a few weeks ago by the threatened importation of 20 Australian rabbits, may draw their own inferences as to the utility of giving these animals a foothold in California.

ARTIFICIAL RAIN.—Among the many methods of applying water in this State, we imagine that that reported to us from Havilah, Kern county, is unique, and approaches nearest to a rainstorm. One grower there has several hundred "globe lawn-sprinklers" arranged in lines of 50 sprinklers each. Each sprinkler has a half-inch pipe with a stop-valve, and each main, which feeds the 50 sprinklers, has also a stop-valve. Each sprinkler irrigates an area 40 feet in diameter. The mains are of two to four-inch pipe. It is said that 50 sprinklers are generally going at one time, the water coming from a reservoir with 200-foot elevation. The gentleman who has this system in operation says that he finds that insects on trees and vegetables are greatly reduced by it. What a pretty sight 50 large lawn-sprinklers all in operation must be.

Horticultural Convention.

At a recent convention of fruit-growers, a request was made to the State Board of Horticulture, that they hold two conventions each year, one at the north, the other at the south. This has been duly ordered, and the President, Ellwood Cooper, has issued a call for a convention to be held in Riverside, beginning Monday, April 11, and continuing during the week. At this time will also be held the semi-annual meeting of the State Board, and one important item of business will be the election of a secretary to succeed the late Col. Webb. We stated last week that a law had passed providing for two Inspectors of Fruit Pests, one at the south and the other at the north. This statement was incorrect, for the bill was lost for lack of time at the close of the session.

The Riverside people have wisely determined to hold a citrus fair during the session of the convention. This will be an additional inducement for fruit-growers from a distance to attend. We can earnestly advise them to do so. Our own experience in the welcome which Riverside extends to her guests, warrants us in assuring visitors that Riverside is a good place to go to.

Still another item which we expect will add luster to the convention, will be the possible presence of Prof. C. V. Riley, U. S. Entomologist. The telegraph brings the announcement that Prof. Riley left Washington on March 19, and will go first to Southern California. The visit of Prof. Riley has been long anticipated, and we are glad it is to be realized. It is probable that he can arrange his program so as to attend the Riverside meeting, as so much which is of interest to him will there be brought forward. The middle of April is rather late for Riverside citrus fruit to be seen at its best, but there will be plenty of it, no doubt, and samples of the preserved fruit products of the colony would of itself form a display worth a trip the length of the State to see. To those desiring to attend the Riverside Convention and Fair, special transportation rates have been granted by the Central & Southern Pacific Railroad Co. to Colton, from all points on their lines. Attendants will need to obtain receipts of local agents for ticket purchased, which receipt, signed by the Secretary of the Board at the Convention, will entitle the holder to a return ticket at one-third the regular rate.

FROM AFAR.—The breadth of the interest in the agricultural experiment work being done in California may be intimated by the fact that last week Prof. Hilgard received an application for his reports from Constantinople, Turkey. We have often spoken of the wide usefulness of agricultural experiment and investigation as pursued in this State, but it did not occur to us before that it might possibly have a bearing upon the settlement of the great Eastern question.

THE demand for olive trees this season has been largely above the supply, says the San Jose *Times*.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions

Santa Barbara County Notes.

EDITORS PRESS:—As we see a great deal in the papers about the nice fruits, vegetables, flowers, and large squashes, beets, potatoes, etc., that grow in the central part of California, and see but little in print of what we in Santa Barbara county are doing, I propose to give you a few facts and figures about the productions of this part of the State.

We think we can grow the largest squash in the State. At our late county fair seven squashes were exhibited by one man from Goleta. The largest one weighed 270 pounds; the other six averaged over 250 pounds. Dr. Couch, of Carpinteria, grew one that weighed 268 pounds. A 200-pound squash is no uncommon thing around Santa Barbara. At our late fair your humble servant exhibited 12 beets that covered the bottom of a wagon-box. Eight of them weighed 400 pounds, and were grown in 5½ months from the time seed was planted. The largest one weighed 53½ pounds. Lompoc exhibited Irish potatoes weighing 6 pounds, 6 ounces. We also have sweet potatoes weighing 8½ pounds, and one hill of sweet potatoes of 26½ pounds, variety yellow Nansemond. We also have the finest of vegetables of every kind almost every day in the year. Fresh strawberries have been in the market all winter. Quite a number of citizens had bananas ripen in the open air.

On the Hollister estate are ripe dates in considerable quantities. The lemon and lime seem to flourish to the hight of perfection. Mr. Packard, of the Montecito, claims from $800 to $1000 per acre, as the returns from his lemon orchard. Oranges are doing finely where good care and plenty of water are used. Prune trees grow from 4 to 12 feet in a year; apricots, nearly as fast. In fact, we grow almost any kind of fruit and nuts.

The English walnut is being planted quite extensively, and when 15 years old will pay ten per cent on land worth $500 an acre. Choice flowers bloom in the open air all winter. We have had no frost to do any damage, and have had rain enough to insure fine summer crops, and we will probably have good crops of grain and hay. Fruits of all kinds are looking well, and we anticipate a good yield.

Santa Barbara seems to be in luck the last year. The railroad is within a few miles of the city, and the electric lights will soon shine forth as the noonday sun, and above all the city has put in a fine sewer; also a telephone system. Now, with our fine climate, liberal productions, and all the improvements I have mentioned, what more can man want here below?

There is quite a boom in real estate. Some of your good people from San Francisco have been purchasing quite extensively, and we look forward to the time when our hills and valleys shall all be covered with pleasant homes for the aged and feeble, and when the little children can take the hands of their grandparents and say: "Let's go out and get a bouquet of flowers," any day of the year.

Carpinteria, Cal. P. C. HIGGINS.

Tuolumne County Notes.

EDITORS PRESS:—Winter is giving place to spring, sunshine and flowers. Growing crops, blossoming trees and grandeur all around is experienced at this season among the foothills. Our prospects for an abundant harvest and fruit crop were never better than the present outlook. This is a pear year. Every tree, small and large, is filled with bursting buds. Many of them are out in full bloom. Some few of the boomers from the sunny south are finding their way among us to see what lies beyond the orange belt. But when they gaze upon large trees loaded down with beautiful oranges without one speck to mar their golden yellow, they begin to think that the best half of California has been but seldom heard from. And to have it spread abroad that Knight's Ferry carried away the first prize at San Jose Citrus Fair, was a something undreamed of by those who pin their faith upon other parts of the State which are most talked about. Oranges which find their way here from the lower country are small and crusted with black blotches which mar their appearance and eating value. No such scaly fruit grows among our foothills.

Knight's Ferry is 14 miles from my place, and is really among the foothills bordering on the plains, and only some three miles from our county boundary. Mr. James Goodwin, Mountain Pass, same distance from the ferry, has orange trees in full bearing—seedlings. The fruit is large and beautiful. It is a grand sight to see hundreds of yellow, golden oranges amid the green. Mr. West, a member of the Legislature of Indiana, made Mr. Goodwin's place a visit a few days ago, ate his oranges, tasted his wine, and came away delighted and expressed himself as if men were making fools of themselves by paying such fabulous prices for land when better oranges can be raised in these foothills, having a clear, bracing and healthy atmosphere and scenery for grandeur the world cannot surpass.

Only a railroad is wanted to give us a boom and bring among us men of capital and energy to improve our natural facilities. This is one reason why we do not advance as fast as some parts of the State. Lack of social pleasure is another, and the extent of land suited for colonies still another. Our favored garden spots are in small valleys, isolated to a degree, and this precludes colonizing on a large scale, and this may be the principal cause of our lack of development. But as the favored localities fill up with wealthy families, the middle class will find out this region where they can rear homes amid scenes grand and sublime, where perpetual summer and sunshine is the rule and not the exception. Those who come among us for permanent settlement should come to purchase, as most of the favored places are occupied, and they can purchase cheaper than improve.

We were informed a few days ago that crickets had made their appearance on the plains and threatened the crops. It is to be hoped that no blight will mar the fine prospects which at present prevail. The cold wave which we experienced some time ago rather stunted the young crops. But the present warm weather is truly an inspiration. Feed and growing crops are springing into life, making the heart of the husbandman rejoice. The RURAL is received with regularity, and the reading of the same enjoyed. When we knew the RURAL in its infancy, it was not the matured visitor we have to-day. It is a proof of that much-written-of doctrine, "evolution"—the greater evolved from the less. It may be the same as that other saying: "May work both ways." Evolution does not mean at all times that we are growing in grace, for many seem to go downward instead of heavenward; but the RURAL keeps steadily progressing and developing our natural and acquired resources. No State in this big Union may boast of all which goes to make up happy rural homes like California, and the best lessons of rural life may be found in your pages. May your enterprise meet with its merited reward.

JOHN TAYLOR.

Chinese Camp, Tuolumne Co.

Summer-Fallow in Fresno County.

EDITORS PRESS:—Henry Hulbert, farming six miles northeast of Selma, in speaking of the benefits of summer-fallowing, notes the following experiences:

First. In 1885 he irrigated and summer-fallowed 45 acres, plowing seven inches deep. In the fall of the same year he plowed again, this time four inches deep, and put in wheat with drill 45 pounds per acre. The yield in summer of 1886 was 475 sacks—144 pounds to the sack—for the tract.

Second. In December, 1885, and January, 1886, he plowed 40 acres, 3½ to 4 inches deep, and, while plowing, sowed wheat from the plow, about 45 pounds per acre. The soil of half this tract was equally as good as that of the tract first above mentioned, that of the remainder a little lighter. The yield was 155 sacks, of nearly 145 pounds to the sack. The grain filled a little better on this tract than on the other, taken as a body. The first showed some shrunken grains.

The soil of both tracts is locally known as "white ash." It has considerable sand in it, yet, when wet, is gummy and sticky. The wheat was all Sonora wheat, which Mr. H. considers best for this locality. It is thought that the slight difference in two varieties of soil in the last mentioned tract would not at all be sufficient to account for the great difference in yield between the two tracts, but that the results shown should be almost entirely attributed to the different methods resorted to in the preparation of the ground. McD.

Fresno Co.

THE GARDEN.

Whole Potatoes for Seed.

EDITORS PRESS:—Repeated trials and much observation during the last 50 years have convinced me that a whole potato is far preferable to a piece for seed, and a medium-sized one is to be preferred to a very large or a very small one. If a whole potato be planted, no more shoots will start from it ordinarily than where a part of the potato is planted; and what do grow will be just the ones nature designed should grow, and there will be just the kind and amount of nourishment in the whole potato to start the plants into a vigorous and healthy growth; whereas, if a piece only be planted, all the eyes in the piece will be likely to grow, thus sending up feeble, sickly plants, having little vitality, with nothing back of them to sustain their growth. Dame Nature, left to herself, unmolested and undisturbed, will only propagate the "survival of the fittest." All animals in a state of nature are as perfect as when they first emanated from the hand of their Creator, notwithstanding there is a promiscuous intermingling of father and daughter, brother and sister. And the reason of this is, that only the lords of the harem, the strong, vigorous animals, are allowed to perpetuate their kind. Just so with a potato. If a whole one is planted, only the strong, vigorous, prominent eyes will start, absorbing all the nourishment from the feeble, weak eyes, leaving them to perish. Forty and fifty years ago we always planted a good-sized potato in each hill, and never failed in raising a fine crop of smooth, healthy, fine-flavored potatoes, 400 to 600 bushels to the acre being no unusual yield. I have taken 60 pounds of potatoes from eight hills. At this time potatoes were only worth in market 15 to 25 cents a bushel, and were mostly fed out to stock at home. When they became dearer, farmers began to cut their potatoes, in some instances merely planting the parings, with one or two eyes in each piece, and soon a marked deterioration, both in yield and quality, set in, and the fatal rot supervened to the almost total annihilation of this indispensable article of food. I grant, if the season and all other conditions are favorable, a good crop may be realized from planting small potatoes, or even pieces with only one or two eyes in each piece; but if this practice be continued the result will certainly be disastrous. Only seed potatoes should be planted, and every hill of potatoes contains seed potatoes and cooking potatoes, and the one should not be substituted for the other.

THE VETERINARIAN.

Hog Cholera.

EDITORS PRESS:—This disease, about which we hear so much at the present time, is, like all other contagious diseases, due to a "germ." The animals are taken with ordinary symptoms of ill-health; they lie apart from the others; their internal temperature rises considerably, red and sometimes blue patches are noticed on the region of the bowels; they do not eat anything, and after a varying length of time they suddenly get worse, and death puts an end to the scene. It is not necessary in a non-professional journal to trace the minute changes, development of the bacilli, etc., but it will be well to treat the matter in a practical and plain manner. The common terms are "red and blue soldier." These indicate the different stages of congestion; in the first it is mostly in the arteries, and in the latter, the blood being darker, it consequently indicates that the blood has congealed more in the veins; or, in other words, "venous congestion." This accounts for the characteristic appearance of the skin upon the abdomen, about which mention is made above. There are other local terms, but it is hardly important that we should inquire further into them, as they simply indicate some ante or post mortem appearance. In addition to the intestines being affected, the mesenteric glands are also found to be in an altered condition. It will be best, perhaps, to explain the position of these glands, otherwise it would not be easy for those who are not posted in anatomy to understand how it is that these glands become diseased. They are placed in the mesentery, which is a membrane attached to the intestines, and their function is to help to convey (and somewhat alter the character of) the liquid and nutritious portion of the food, which is conveyed through them with the assistance of vessels termed *absorbents*. All this is necessary to remember, as by this it is easy to understand, or, at any rate, it seems rational to come to the conclusion that this "hog cholera" is a disease which has its origin in the *food* taken into the intestines of healthy animals. Some medical and veterinary authorities have termed it "pig typhoid," thinking that it, to a great extent, resembles typhoid fever in the human subject; and my knowledge of the disease leads me to say that "pig typhoid" is the best name. It certainly resembles human typhoid in its origin, and to some extent in its post-mortem appearances. It is characteristic of these specific inflammations, whether occurring in the intestines or not, that they are of a chronic nature, or slow tendency to heal or increase, as the case may be. The inflammation of the intestines and intestinal glands, as I have said, does not spread rapidly like ordinary inflammation. Another most important point is that the inflammation begins from certain points on the mucous membrane, due to the radiation (if I may here use the term) from the "original germ." This is also the case with pleuro-pneumonia contagion in cattle, and other contagious diseases, so that we get "patches" of inflammation on the intestines; but this is not the case in ordinary inflammation, it being diffused more or less evenly over the whole surface. Inflamed glands sometimes run on to the formation of ulcers, termed *typhoid ulcers*. To make a thorough examination, the microscope must be used, and all the careful and very delicate manipulation, preparation of specimens, etc., gone through. But this is, as we well know, the study of a lifetime. Profuse hemorrhage and perforation (*i. e.*, through the intestine) may result, and when this does occur, the animal dies from peritonitis—that is, an inflammation of the external part of the intestines. The peritoneum is that glistening membrane seen on the outside of the intestines, and lining the abdominal cavity. But this is not the usual cause of death. If the animals are in a low state prior to attack, they may die from inanition; but they generally collapse from "blood-poisoning."

Causes.

Among other predisposing causes may be mentioned the food these animals eat and their general condition. The wonder to my mind is, that they do not suffer more from disease than they actually do. Undoubtedly these, as I say, do not *per se* really produce the trouble; but the general unhealthy condition in which pigs live makes a suitable habitat for the "pig typhoid germs" in which to develop. Possibly the reason that lately the disease has been heard so much of was due to the fact that it had made much headway before it was brought under the notice of the proper authorities. I remember once being asked the question: From whence came the first case? It would be just as impossible to say where the first oak tree came from.

Preventive Measures.

As we well know, it is absolutely impossible to attempt the cure of these cases, especially where much structural change has taken place. Indeed, all we can do is to put forth our best endeavors to prevent the spread of the disease, by separating the healthy from the unhealthy, dispatching and burying and covering with quicklime the affected ones, and thoroughly purifying the styes in which the diseased animals were kept, throwing down plenty of boiling water all over the floor, sides, etc., using a large quantity of the driest disinfectants, carbolic acid, etc. It is not necessary to explain all the veterinary sanitary police measures adopted in Europe, as they are, of course, well known to readers, such as notification to police authorities, they then declaring the premises infected, and causing them to be isolated, etc.

Remarks.

Few things are more important and interesting than a study of comparative diseases in man and the lower animals, and certainly this matter has not received that attention which it deserves. There is nothing that will bring the veterinary profession more to the front, and enable it to take its proper position, than for it to show to the public the necessity for adopting proper measures for the inspection of meat, and the importance of adopting more thorough and rational methods of keeping animals from disease by good food, ventilation and general sanitary conditions. THE ORNITHOLOGIST.

The English Sparrow and Scale Insects.

EDITORS PRESS:—It is held to be a Christian virtue to speak well of an enemy. The European sparrow has been much decried since it came among us. I have largely shared this ill-will, and cannot, even now, feel pleasantly toward the little, pugnacious foreigner, although my later acquaintance has revealed some extenuating traits of character. I charge the sparrows with the crime of driving the songsters all from my yard. Certainly, since their advent the house wren, the bluebird and the linnets, which used to nest with me annually, have left their old haunts and disappeared. Their little domiciles that I used to prepare with much care have remained untenanted for four years and have crumbled away unused. I have good reasons for charging the sparrow with this eviction, and until recently had been unable to see that it had proffered any recompense for the loss it had occasioned.

Like my neighbors, I am afflicted with the plant scale, thrifty colonies of which spring up in every unwatched nook. I have fought them as best I could. I have found free trimming and strong alkaline washes, thoroughly applied with a stiff brush, the best remedies. But despite my best efforts they still stay with me, setting up a thriving business, now and then, in some overlooked clump. They seem most at home on the tree malva—the *Malva real* of the Spanish (a tree which I cultivate for its green foliage and its plaques of bright winter bloom), the white jasmine, the ivy, the orange; and of late I have found a very prosperous settlement on the California bay tree or California laurel.

In the early winter I observed a flock of some 20 sparrows in the malva, which was covered with scale, and the edict had gone forth that in the spring the malva must go. They were there day after day, chattering away, and seemed very merry. I thought they were there for shelter. They were very tame, and upon observing closely I concluded they were feeding possibly on the flies and insects which frequent the tree. I noticed at the same time that the bark on the branches was completely studded with little white spots where the scale, as I supposed, had fallen off. A little later the sparrows left the malva and were chattering every day in a clump of white jasmine, which also had the scale. Here I watched them again and became satisfied they were feeding. A little later I one day found them on an orange tree in a neighbor's yard, and as the foliage was less dense I could see them pick the scale insect from the leaves, sometimes getting a position where one of them would detach a whole row of scale planted along the mid-rib of a leaf. I much desired to drop one of them and examine the crop for the insect, but had no means at hand with which to do the "barbarous deed," and thus did not make this crucial test. That they dislodged the scale I know. I think they ate them. They are now

quartered in a clump of ivy, where every spring I am obliged to fight the scale.

Since determining what the little sparrows were up to, I have inspected their work and find they have not done a clean job. While I find evidences that many living scales have been dislodged, I find they have left enough for seed. They are probably too light-hearted and playful to do what our fruit-growers would call conscientious work.

What they might do if in greater numbers and if given more time, I cannot tell. If, in the fruit-growing sections of Europe and Asia where the sparrow is very numerous, they are free from fruit pests, and their immunity is due to the sparrow, it may be to our advantage to cultivate him. He may turn out but a tramp who asks for work that he may get a quarter for a drunk, and he may mean business—who can tell?

In any event, this little hint, as to what the sparrow can do, opens up an interesting field of investigation for the fruit-grower and the florist. The destruction of so-called fruit pests by chemicals and other appliances, which are now all the rage, is too expensive and too difficult of application to be of general utility in any large way. If something can be found that feeds upon them, the process of extermination will become more feasible.

All of the so-called finch family—the sparrow, the linnet and the finches proper—are great devourers of minute insects which have their homes upon the bark and leaves of trees; but they are all limb-perchers and cannot well feed upon the trunk. This, however, is more readily within the reach of the gardener. The titmice, or chickadees, as Americans call them, are also fond of the minute bits of food that they find upon the bark of trees, and some of them are trunk-perchers. Most of them, however, are too wild to be of service in the orchard.

There comes in another thought: Why is it that many trees and shrubs, which, growing wild, do not suffer from these insects in their native habitat, but when cultivated, become feeding ground for these pests? I never saw a scale on a bay tree when growing wild; but I have one in front of my yard which is covered with it. [The bay trees in the canyons of the Coast Range are in some places very badly infested with scales.—EDS. PRESS.]

May it not be that when growing in the forests the little birds that are seen flitting through their branches, skipping along each twig, eyeing sharply each crevice and leaf, keep them clean? These timid little fellows are not constantly in active motion for mere show. They are not in never-ceasing action from early dawn until dusky eve for the mere love of exercise. They are trying to gain a living; they are looking for food, and hundreds of little insects find a lodging-place in their crops every day. Were it not for the very laudable endeavor of these little busybodies to earn an honest living, our forests would soon fall a prey to the ravages of some detestable scale-bug. Let us cultivate the birds. Even the sparrow should not be condemned without a hearing.

A. H. AGARD.

Oakland, March 3, 1887.

HORTICULTURE.

Some of the Fungoid Diseases Affecting Our Deciduous Fruits.

Bulletin No. 5, State Board of Horticulture.

The peculiar climate of the coast of California, especially that of those sections within the more direct influence of the fogs of the ocean, offer specially favorable conditions for the development of injurious fungi, popularly known as rusts, smuts, mildews and blights, which, as cultivation extends, seem to increase and cause serious loss, if not total destruction, of our crops.

Nature of Fungi.—The study of fungi, at least of the lower and most destructive forms, does not date very far back. Owing to their minuteness of structure, our knowledge of their character is due to the microscope, without the aid of which they cannot be scientifically determined. The number of species and families of fungi is very great, and in fact the difference in size between the smallest and largest is as great in proportion as it is between the tiniest herb and the giant of the forest. But with all their great differences they have, of course, certain points in common which separate them from higher plants, although some of these characters are shared by ferns and lycopods. I refer to their mode of reproduction. Before entering upon the discussion of the separate kinds it may be well to review the characteristics of this function. The organs of reproduction—that is, the spores, analogous to seed—in the higher fungi, as the toadstool, are contained in the most conspicuous part of the organism, which we see above ground. That which answers to the stem and root of the plant combined is below ground, or feeding on the object that supplies its nourishment, by sending its minute threads through the tissues, is known as the mycelium. To become a true resting spore, which, like the seed, can remain dormant for seasons, until favorable conditions for its development are offered, a certain process, analogous to the fertilization of the pollen on the egg of the flowering plant, is necessary. But these resting spores are not necessary during the time of the most active growth of the fungi. Then spores, which may be compared to bulblets, such as are produced by the onion and lily, are developed, and these seem to possess the power of indefinite multiplication. It is this power that explains the very rapid development of fungi, and renders them particularly destructive. It seems evident that nearly all the blights, so called, troubling our fruit trees, are due chiefly to some sort of fungus, which has gradually spread. This will account for the fact that orchards of certain varieties of fruit, once bearing sure crops, are now very uncertain and often failures.

Fusicladium dentriticum.—The first species of fungus to be discussed because, perhaps, one of the most serious, is the black pear and apple smut, the fusicladium dentriticum.

FIG. 1.

Mention of this can be found in older horticultural works, although nothing very definite. Robert Hogg, in his "Manual of Fruits," says of the so-called fox whelp apple, that it may be known by its peculiar scabby spots (a figure in the book shows this), but adds that this is not a distinguishing mark of this apple, being in reality the effect of a species of fungus, *spilocœa* pome*, which affects other apples as well. The disease, then, cannot have been considered anything formidable, as no further mention of it is made.

In Du Breuil's "Cour d'Arboriculture" is described a disease which undoubtedly is the same as the previous one in question, affecting certain varieties of pears, causing black scab on them and rendering them unsalable. It further says that sulphur has been tried as a remedy, but without success. The report of the German experimental school at Geisenheim, on the Rhine, speaks of the fusicladium affect-

FIG. 2.

ing the white calville apples seriously, and says that sulphur dusted five times over the apples had counteracted the disease, and also records that these sulphured apples, compared with others not sulphured, were little affected by the codlin moth.

In 18— Professor Trelease, of the University of Wisconsin, published a very interesting paper, in which he demonstrates the fact that the fungus or blight of the foliage of the apple is identical with the smut causing the scab on the fruit.

Comparing the effect of the fungus on the fruit and foliage, there can hardly be any doubt that it is the same fungus that affects both pears and apples, and that the so-called blight of the Winter Nelis pear is due to an aggravated form of fusicladium, or rather, the Winter Nelis, more than other varieties of pears, is subject to this disease. In endeavoring to prove this, it will be necessary to review the history of this blight.

*This is the old name of the fusicladium dentriticum.

Ten years ago, nothing was heard of this trouble. Winter Nelis bore and matured in many places on the coast where they are now being abandoned as a failure. About five years ago I noticed at the experimental orchard of the University the leaves of two trees in the extreme southwest corner of the orchard, during the month of May, becoming smoky looking, revealing under the magnifying glass a smut-like fungus. The trees produced but little fruit, and most of this was badly affected with the same smut. The warm weather dissipated nearly all the signs of the fungus, and it was not until next season that I discovered it again on the foliage of the same trees, as well as on six or eight adjoining pear trees, attacking the latter in precisely the same manner as it had the first variety, affecting foliage and fruit as well. Next season again I was astonished to find, after a few days' absence, that the same blight had made its appearance in all parts of the orchard, affecting some varieties very severely, others less, and some not at all. It was the same year that the blight of the Winter Nelis was so general, as most people remember. This year, according to Mr. J. McLaren, of San Mateo, was the first year the disease was noticed in San Mateo county, and this year, also, in the Santa Cruz mountains that the so-called apple tree blight proved very severe. In fact, from every quarter within the region of the fog belt, complaints of this blight were heard of.

This season I determined, if possible, to reach some definite conclusion in regard to the nature of the blight as reported from various quarters, and from a thorough comparison I am satisfied that the fusicladium dentriticum is the cause of all the trouble. In the experimental garden at Berkeley, we have had all grades of it on the pears, and on one variety, the first attacked, the bloom is affected precisely as in the case of Winter Nelis, and the consequence is that the fruit does not even form. The branches of this one (see figure) when young are attacked by fungus, and the second year reveals the damage done. This is shown on another branch in the figure, the counterpart of which I have found in several orchards, notably in an eight-year-old orchard near Watsonville. This orchard, although otherwise in an apparently healthy condition, has failed to bear at all.

In the case of the white Winter Pearmain, we have in the cracked bark peculiar to this variety abundant protecting places for the resting spores, which carry the disease over from year to year. Most probably the spores, seating themselves under the scaly bark, are protected from such changes of atmosphere as are brought with the dry north wind, that destroyer to all forms of fungi. On the smooth branches of other varieties comparatively little opportunity for the lodgment of resting spores is presented, and the time of blooming has passed before any great number of spores have developed, so the harm that is done does not show itself until the young fruit has advanced a little, while on the other hand, varieties seriously affected have sufficient spores present to destroy the bloom.

Experiments at Berkeley.

Having read of the good results of the application of sulphate of iron on certain mildews, we determined to spray with it. The results produced were not favorable; when used strong enough to affect the fungus, it affected the foliage and fruit also. One pound to 40 gallons was the strongest solution that could be used on the trees in foliage without hurting the latter seriously; used stronger, it had the effect of checking the fungus and the fruit and foliage at once. Even with the solution one pound to 40 gallons of water the foliage suffered and the fruit dropped. Next season the sulphate of iron was used early, before the leafing out, one pound to 30 gallons; and again, weaker, after the foliage was out. The season proved unfavorable to the development of the fungus, being a warm, dry spring. Still, the disease showed itself on such trees as were much subject to the disease, proving that the wash had but little effect. Prof. Riley's kerosene and sour-milk emulsion was also tried, partly as a scale exterminator. It proved, likewise, of little use as a cure for any of the complaints. The following season, spring of 1885, substantially the same compound, used the succeeding season so successfully, was used again, but applied cold. It produced favorable results, but not enough to be called successful. A great deal of scabby fruit could be found, the spring also being very dry, and the comparatively healthy looking fruit we attributed to this favorable condition. The season of 1886 brought out the fungus in full force again, this time showing itself all over the experimental orchard.

Successful Remedy.

The sulphide of soda with whale-oil soap prepared as follows: "Dissolve 30 pounds whale-oil soap (80 per cent soap, at the most costing five cents per pound) in 60 gallons of water, by heating the two together thoroughly. Boil three pounds of lye (American concentrated lye is what we have used) with six pounds of sulphur and a couple of gallons of water. When thoroughly dissolved it is a dark-brown liquid (chemically sulphide of soda). Mix the two—the soap and the sulphide of soda—well, and allow them to boil for about half an hour; then add about 90 gallons of water to the mixture, and it is ready for use." This was applied warm, at the temperature of 130° F. in the barrel, from which it was sprayed. The remedy this time proved a decided success, and with the exception, the variety first attacked years ago, only such fruit as had not been covered with the solution was affected the least. Such varieties as for years, and even last year, a favorable season, had suffered so severely that they were almost cracked to pieces, were perfectly smooth.

Sulphur, mechanically mixed with soap, had also been tried several times before in the shape of the so-called codlin-moth wash, but its effects, when used in this locality, had been nothing. Reports from sections with a warmer summer temperature show better results. It seems, therefore, that in a cool climate, when sulphur simply is used, it does not develop the vapor sufficiently strong. But the sulphide of soda, especially when the compound is used warm, gives a brisk action, and the germs of the fusicladium are killed.

As the varieties of fruits suffering from the fusicladium are affected in very different degree and at different time of development, some apples and pears being attacked already in bloom, it is evident that they cannot successfully all be treated alike.

According to this theory, we have arrived at the conclusion that the different varieties affected in different degrees require different modes of treatment.

Varieties of which the bloom already affected is not allowed to set.—For these I should recommend a very thorough spraying in the fall, and also in the spring before the blooming, and if the fruit should show signs of fungus, spray again after the setting.

Varieties blooming and setting before the fungus attacks them.—One thorough spraying after the fruit is set.

The appended figure, No. 1, shows the work of the fungus on a Winter Pearmain apple; *a*, the fruit in its natural size; *b*, a blotch enlarged. Both show plainly the rapid spread of the fungus destroying the tissue of the apple. The center is black with millions of growing spores; the circumference still shows the remnant of the epidermis. Such an apple will eventually be like the scabby fruit so often seen.

Fig. 2 shows the effect of the fungus on pear branches; *a* is a young one-year-old twig, showing the effect on leaf and bark, and similar to that on apples; *b*, a two-year-old branch, shows the disease in its secondary stage, such as can be seen in a badly affected Winter Nelis tree.

It should be distinctly understood that we do not claim to have proved that the sulphide of soda is a perfect remedy for the Winter Nelis blight, or for apples blighting in bloom, but we think it will prove so. The following remedies are suggested for trial against the latter two afflictions:

Remedies to be Tried.

1. Substitute, in place of concentrating lye or powdered caustic soda, *caustic potash* 98 per cent, now for sale in this city.

2. *Powder of lime and sulphate of copper*, as prepared in France and used successfully against the downy grape mildew—*Pernospora viticola*—(see Lambson Scribner's report on fungoid diseases, published by the Department of Agriculture) as follows:

Have the quicklime entirely slaked in the air. Take 200 pounds of the lime, which has first passed through a coarse sieve so as to remove foreign bodies. With 10 pounds of this lime and 30 of water make a clear milk of lime. Dissolve 20 pounds of bluestone (sulphate of copper, the purest possible) in 60 pounds of warm water. Let the solution cool to 68–77° F. Mix the solution with the milk of lime, and stir well. The remaining 190 pounds of lime is spread out on the hard ground, preferable on stone flagging or concrete, to a depth of about seven inches, and the mixed liquid being placed in watering pot, one man sprinkles the lime with it while another stirs and mixes it by means of an iron rake with very long teeth, then shovels it over and makes it into a heap. Let the powder, which is only moist, dry for some days; roll it after drying, sift it through a fine sieve and bag it. Two hundred pounds will be sufficient for over two acres of grapes. This powder might be dusted on trees by means of strong sulphur bellows, and should be used shortly before blooming.

3. Liquid solution of bluestone and lime: Fifty pounds of bluestone to 225 liters, then adding 50 pounds of lime in form of milk of lime. As this makes a too thick paste to pass through a spray nozzle, it will either have to be put on with a brush and diluted about one-half, when it will pass through a coarse spray.

4. Air-slaked lime has been used successfully by Dr. E. Kimball to counteract the fungus causing scab on apricots. It may likewise prove efficient on the Winter Nelis pear, dusted on at the time of blooming.

W. G. KLEE,
Inspector of Fruit Pests.

MONTANA AND NORTHERN WOOLS.—An Eastern exchange says: Dealers complain that Montana wools do not retain that pliability and sightliness which so distinguished them a few years ago. The inference for this alleged degeneracy is that the climate or other natural conditions of this mountainous section of the country are not what they gave promise of when sheep husbandry first received its prominence there, or that the system of breeding is imperfect or carelessly attended to. Perhaps none of the territory wools, so called, hold their good qualities so satisfactorily as do those that are grown in Kansas.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Another Good Grange Day.

The faithful Patrons of Eden Grange had a fine day for their ride from Haywards to Oakland, to attend Temescal Grange meeting last Saturday. A goodly delegation was present, although we were sorry to miss the familiar faces of many faithful Edenites. Brother and Sister Field, from Maine, were made gladly welcome by all California Grangers present.

Brother Chester, Master of Eden Grange, under Good of the Order, was called upon for whatever information he could give from headquarters. He responded in a very newsy way, alluding to the Grange already reorganized in Merced county, a charter list of 20 names awaiting organization at Hanford, and an open Grange meeting called by the Grange of Tulare City, to be held early in April. He also mentioned the ground was prepared and good seed ready for planting a new Grange at Delano, Kern county. He was also hopeful that by the aid of the members of San Jose Grange, a Grange at Saratoga or Los Gatos would yet be organized. This, with the other information given, and the fact that a Grange of 30 charter members was reported by Brother Ohleyer all ready for being instituted at West Butte, makes a pretty good showing for the early advancement of the Grange in this jurisdiction.

The Worthy Master stated that he had, by due notice, invited the Grange members of the late session of the Legislature to be present and give information, and state their views on the work of the Legislature, and discuss matters regarding future legislation for the interests of farming and other industries. While it was to be regretted that none of the legislators were present, the meeting was well entertained by discussion among brothers present, and the reading of a manly and timely communication from Bro. Geo. Ohleyer, Past Master of Yuba City Grange, as follows:

A Letter From Geo. Ohleyer.

To Temescal Grange:—Your notice of the meeting on the 19th inst., and invitation to Grange members of the late Legislature, including myself, to be present and give their experience at the recent session, and to advance suggestions for "future legislation concerning farming and other industrial interests," is before me; and as I cannot possibly attend on that day, I will venture a brief description of my experience and a hint in respect to the future.

The farmers in the late Legislature were fully up to the average in capacity, integrity and intelligence, but they lacked cohesiveness and numbers.

If "trading" is to be the rule (as it certainly was at the recent session), then the farmers and Grangers should have followed the example set them by those of other professions. If they failed to wield the influence that was expected of them, it must be ascribed to want of unity of purpose. Of the two leading political parties, one domineered the Senate and the other the Assembly, and in the beginning "King Caucus" issued his mandate and our farmers felt called upon to obey orders. Being divided and in the minority, they exerted no power in shaping the committees or controlling the appropriations which have swelled to greater proportions than that of any former Legislature.

Doubtless, like the writer, many, and perhaps all the members from the rural districts, lacked that schooling in the arts of the experienced legislator necessary to combat the trained manipulator.

We trusted too much to merit and not enough to organization—the old story—to correct which the Grange was instituted; and yet it seems we have not fully learned to trust one another. There were, however, but few Grangers in the Legislature, but those were true to themselves, to each other, and to their constituents. Had all the farmers been united, met together in caucus and private consultations, they could, to a great degree, have controlled legislation. Shall we learn a lesson from this circumstance? The wonder is not that so little was accomplished, but rather that so much was done by such a limited, unorganized, but faithful body of men. Their votes and influence always went to the right side of every proposition, and many good measures owe their adoption, and bad ones their defeat, to the vote of the farmers.

Commerce and agriculture, the great and growing industries of our State, had but few champions in either House, and least of all from the great commercial centers. These have shown an indifference truly appalling; they rested their cause in the hands of the farmers against whom they sought to combine on every important measure.

The future will have nothing better for us if we do not organize and make common cause.

Before another Legislature convenes, let it be understood that commerce and agriculture must unite, irrespective of party or politics, to the end that their strength may not be frittered away. We can trust their good intentions, but in organization only can they be made available.

I take great pleasure in announcing to you that on next Saturday a new Grange will be organized at West Butte, in this county, with a charter membership of 30 or over. The place is about 15 miles west of Yuba City, and the material is first class.

Hoping that you may have a most successful meeting, and that at some future time I may have the pleasure of meeting the brothers and sisters of Temescal Grange, I remain, fraternally yours, GEORGE OHLEYER.

Yuba City, March 16, 1887.

On motion of Sister Kelsey, a vote of thanks was passed to Brother Ohleyer for his excellent communication, with a cordial invitation for him to visit Temescal Grange at his earliest convenience.

Brother W. G. Klee, by request, mentioned the subject of legislative action during the past session, concerning horticultural interests, and enactments for protection from insect pests. Although the Legislature failed to pass all such laws needed, it was to be hoped that some benefit would be derived from the Acts which were finally passed.

Brother Amos Adams recommended that instructors in entomology be employed to travel into different sections of the State, and give lectures and instructions to the different schools from time to time. The same matters were spoken of at a later period of the meeting by Sister Kinney and others, and the speakers were requested to furnish some of the statements made for publication hereafter.

The fourth degree was conferred on William and Nellie Webster, children of J. V. Webster, Past Master of the State Grange (now absent on his ranch in San Luis Obispo county), and who, it was generally regretted, could not be present on the occasion. A new applicant for the degrees was also elected.

It often seems remarkable (not to say wonderful) how quickly rough boards are transformed into beautiful and handsomely decorated banquet tables, profusely supplied with substantials, at our Harvest Feasts. This is proverbial on Grange occasions, and the Harvest Feast spread before the gathering on this occasion was by no means an exception. After all had drank and eaten to their heart's content, the Worthy Master called upon the honored guests from Maine, when Brother Field in very pleasant terms congratulated Temescal Grange upon its promising new members, and also the young Patrons upon their admission to the ranks of so noble an Order. He mentioned forcibly the duties and obligations of both young and old members, expressing beautiful sentiments and encouragements for both old and young children of the Grange.

Brother Field was followed in an entertaining manner by Brothers Chester, Klee, Adams, Prothero, Frink, Sewall, Renwick, Goodenough, Perham, Dennis, Paine and Kelsey, and Sisters Paine, Perham, Henley, Brooks, Dennis, Anway, Dewey, Babcock, Renwick and other Patrons, keeping up a lively and pleasant time for more than an hour's duration.

A well-rendered recital was given by Sister Nellie Webster, and a splendid song by Sister Roxie Dennis.

On returning to the hall, an open meeting was held. Further discussion on the subject of the day was held of much interest. We regret not having space and time to report more fully at present.

Sonoma Grange Notes.

[Written for the RURAL PRESS by "OCCASIONAL."]

Santa Rosa Grange conferred the third and fourth degrees, and celebrated the Harvest Feast, Saturday, the 12th of March. A very large attendance of members and visiting Patrons from Bennett Valley and Sebastopol Granges made the meeting one of the most pleasant that has been held for months. Three applications for membership were received. Santa Rosa will be in good order for the fall meeting of the State Grange.

E. W. Davis, W. M. of Santa Rosa Grange, and his family were tendered a surprise party, at their home in Bennett valley, Saturday evening, March 19th. There were at least 60 Patrons present. The Worthy Master was taken completely by surprise. The self-invited Patrons brought a band of music and plenty of well-filled baskets, and a jollier crowd is seldom seen. Dancing, card-games, chat, fun and frolic, held high sway, while supper added to every one's delight. On departing the friends said that they would come again, without an invitation.

At the meeting of Sonoma County Pomona Grange, to be held Wednesday, the 20th of April, in addition to the regular business of the session, the following select program will be rendered: 1. Vocal quartette by members of Sebastopol Grange. 2. Address, J. P. Whitaker, of Bennett Valley Grange. 3. Select reading, Miss Fannie Gamble, Santa Rosa Grange. 4. Vocal solo, Mrs. G. W. Huntley, Sebastopol Grange. 5. Address, S. M. Martin, Two Rock Grange. 6. Vocal quartette, by members of Sebastopol Grange. 7. Address, S. T. Coulter, W. P. M., State Grange. 8. Suggestions, by Patrons. 9. Song, by the Grange.

THE ORDER APPRECIATED.—Referring to the same meeting spoken of by our "Occasional" correspondent, the *Republican* says: There is a new enthusiasm among the Grangers. The merits of the Order are just being discovered by many farmers. Santa Rosa Grange is sure to increase largely in membership during the summer, in anticipation of the grand session which is to be held in this city the coming October. Such a meeting as the one held by Santa Rosa Grange last Saturday does much good, and those members who were not fortunate enough to be present lost some of the joys of life that no one can afford to lose. Success to the Patrons of Husbandry, especially so long as we are invited to the Harvest Feasts.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

Congress has adjourned, and, looking over its work, members of the Grange have reason to rejoice at the progress made toward a proper recognition of the just claims of agriculture for fair and equal legislation, and a voice in the councils of the Nation. Never before have the advantages of organized effort been so plainly shown. Without doubt, more than through all other causes combined, farmers united in the Grange secured the passage of the interstate commerce bill, the Hatch experimental station bill, defeated the persistent efforts—continued from other years—to remove all tariff duties upon "raw materials," preserved from amendment or destruction the oleomargarine law, again had the "Secretary of Agriculture" bill pass the House of Representatives, and for the *first* time secured the indorsement of the Senate for so just a measure, which was only finally lost in the rush of business during the closing hours. Yes, we can report progress, and our Order stands brighter and better before the country and the world than ever before.

Our winter campaign has been a successful one, and the sunshine of prosperity brightens our onward way. How true the words of good Bro. Aiken, of South Carolina: "The keel of the Grange ship was well laid. Its majestic sides were ribbed by the mechanism of profound thought. Its spars, braced by fraternal cords, have never been shattered by the fury of the storm. Its sails are still whole, and have been whitened by the friction of popular criticism. Often has it buoyed in turbid waters. Still oftener has it glided gracefully and triumphantly over the billows of prejudice, that lashed so furiously under its bow. To-day it floats in placid waters. Its haven has not yet been reached, nor will it be until every farmer in the land shall have received some of the benefits of its launching."

More and more do we hear of farmers' clubs changing their organization into Granges, and thus going up higher, taking a forward step. All that can be accomplished in the club can be brought about in the Grange and *much more besides*. The club, as a rule, confines its work to *local* matters, and having no formal connection with other clubs cannot well handle matters of State and National importance. It may *discuss* broad subjects, but there is no *unity* of *action*. We are always glad to hear of the organization of a farmers' club, not only because it is so much better than no organization, but because we know that the chances are good that it will become a Grange by-and-by.

"A nation in its industrial progress when the competition of the world is keen, cannot stand still. Three conditions only are possible. It may go forward, retrograde or perish." What a power the Grange must continue to be in this industrial progress of our country, and what a responsibility rests upon its membership in seeing that it is *real* progress.

"I would impress you with the duty of taking such steps, and adopting such measures, as will induce the people of our rural districts to rise to a fuller and clearer conception of the importance of an educational training, and cause them to more fully appreciate the intellectual man, remembering that our agricultural communities are great reservoirs from which must come those who will be expected to wield a great influence over society at large. The Grange should be made a school, indeed, in which the membership can be enlightened and prepared for a higher order of citizenship and be able to hold elevated positions in society. In this you should remember the duty of this progressive Order is not only to permit but to cause the brain to run in such channels and explore such ideas as will yield the greatest possible good to the human race."—*T. H. Kimbrough, Master Georgia State Grange.*

The following item from a personal letter from a Patron in Connecticut tells *how* it is done: "It's men that *make opportunities*. Deputies Geo. A. Bowen, of Windham county, and J. M. Hubbard, of Middlesex county, have been at work writing and talking. A month ago State Master J. H. Hale went down to Middlesex for two days to help Bro. Hubbard, and then three days with Bro. Bowen, and, as a result, each has *three* new Granges, which, with three more organized by State Master Hale lately, gives *nine new* Granges for Connecticut for February." It is well-systematized, *earnest* work and *united* effort that wins.

Here is another item to prove it again: Deputy Geo. C. Bowen, of Connecticut, organized Crystal Lake Grange, at Eastford, February 21st, with 40 charter members, 20 men and 20 women. He was aided by eight members of Little River Grange, and eight from Senexel Grange who attended to the singing, etc. "Everything went off promptly, without a hitch, and was made as impressive as possible."

All are not aware of the influence the Grange now has in public affairs. Fifty-four of the legislators and State officers of Maine to-day are members of the Order, and many of the recommendations of the Governor's message and a large number of the bills now before the Legislature were directly inspired by the Grange.

Progress.

Sixteen more new Granges:

Saybrook, No. 59, Middlesex county, Conn.
Crystal Lake, No. 60, Windham county, Conn.
Wolf Den, No. 61, Windham county, Conn.
Eureka, No. 62, Litchfield county, Conn.
Middlefield, No. 63, Middlesex county, Conn.
Barnstead, No. 119, Belknap county, N. H.
Barker, No 511, Broome county, N. Y.
Smithville Center, No. 512, Chenango county, N. Y.
Empire, No. 513, Broome county, N. Y.
Glen Aubrey, No. 614, Broome county, N. Y.
Fairview, No. 517, Tioga county, Pa.
Clinton, No. 287, Kennebec county, Me.
Albemarle, No. 574, Gates county, N. C.
Grant, No. 679, Huron county, Mich.
Bunker Hill, No. 635, Dawson county, Neb.
Capitol, No. 75, Arapaho county, Col.

Clinton Grange, No. 287, just organized in Kennebec county, Maine, had 73 charter members. There is no longer a limit as to numbers that may be admitted as charter members of a new Grange.

The Secretary of the National Grange has received letters from members of the Order who have moved into Washington Territory, asking authority to organize a Grange there. Bro. R. P. Boice, of Oregon, will look after them.

Illinois Patrons, at the late meeting of their State Grange, set their mark for 5000 new members during 1887, and they are *working* for them; and work wins.

One of the Granges in Michigan, in the printed program of subjects for discussion, and who will take part, says: "Excuses not in order this year."

Bro. H. M. Murray, Master of the Maryland State Grange, is arranging for a series of meetings for Bro. D. H. Thing, of Maine, in May and June.

A class of 25 was given the first and second degrees at West Dedham Grange, Mass., at a recent meeting.

Tennessee received 1318 new members last year. Reinstatements, 429.

"'Tis ours against the wrong
To battle for the right,
To cheer the struggling on
And give the inquiring light."

Newcastle Grange.

EDITORS PRESS:—Inclosed find list of officers elected for Newcastle Grange, No. 241, P. of H., for ensuing year:

R. N. Nixson, M.; J. R. Marston, O.; H. E. Parker, L.; F. B. Fitch, S.; Mrs. Blanchard, C.; Wm. Barter, T.; R. N. Scott, Sec.; J. Noris, A. S.; G. F. Perkins, G. K.; Mrs. L. C. Boggs, P.; Miss Jennie Page, F.; Mrs. J. A. Griffeth, Ceres; Miss Belle Boggs, L. A. S.; Effie Logan, Organist.

Newcastle Grange meets the first and fourth Saturdays in the month, at Good Templars' hall, Penryn. ROB'T N. SCOTT, Sec.

Newcastle, March 19, 1887.

PICNIC AT DANVILLE.—Bro. Geo. P. Loucks, of Valley Grange, and Bro. Chas. Wood, of Danville Grange, have visited us, and reported the action of Danville Grange for holding a picnic at Danville on Saturday, April 7th, to which it is hoped the Grangers in Contra Costa, Alameda and Solano counties will turn out in large numbers, and that large delegations will also be in attendance from other Granges. All of the officers of the State Grange are specially invited. It is the intention to secure one or more eminent speakers to address the Grange on some appropriate subject. Remembering the pleasant and successful Grange picnics previously held at Newark and Concord, we are fully confident that a large and successful gathering will be had.

SENATOR CHANDLER AT HOME.—The *Sutter Farmer* of last week speaks these pleasant words: Senator A. L. Chandler and his two daughters, Annie and Ida, spent several days the fore part of this week in this vicinity—visiting friends and constituents. The Senator was congratulated on all sides for his gallant fight and successful ending of the struggle in the Senate against the Walrath dam bill. Our household acknowledges a pleasant visit from them, which, however, was too brief. They are invited to repeat soon and often.

GRANGE ITEMS.—We gather from the *Patron* that Danville Grange enjoys good health, keeps up its semi-monthly meetings well, and has on the way a class of eight, whom they hope to initiate, with others, in April....Sacramento Grange instructed a class in the third and fourth degrees on the 12th, and indulged in a Harvest Feast....San Jose Grange has set apart April 2d for the sisters' debate on Woman Suffrage.

A FINE HORSE.—Mr. Martin Mendenhall, of Livermore, who has been a pioneer in breeding fine roadsters, exhibited Grand Moor, Jr., a five-year-old stallion, at the Livermore horse show, on the 13th inst. He is 16 hands high, weighs 1180 pounds, with fine action and highly finished. His pedigree is from the best strains on the side of his sire, the "Grand Moor," the same breed as the celebrated family of L. J. Rose, of Los Angeles. His dam, "Corisands," was from Iowa Chief, that made a record of 2:24 at the Sacramento State Fair, in 1879. He was awarded the blue ribbon at this exhibition, and we expect to insert a cut and full pedigree and description in the RURAL, some time this month.

BRANCH NORMAL SCHOOL.—A lively rivalry exists between Chico, Gridley, Oroville, Red Bluff and Redding, as to which place shall be the site of the Normal School, lately authorized by the Legislature to be established at some point north of Marysville. Each offers great inducements, and a party of the Trustees, including Gov. Bartlett, Supt. of Public Instruction Hoitt, J. R. Brierly, T. Ellard Beans, Lawrence Arthur and Ralph Lowe, are to make a tour of inspection among the competing towns this week and next.

WILL NOT LEGALIZE LOTTERIES.—Governors Zulick, of Arizona, and Stevenson, of Nevada, have shown sound wisdom and moral nerve in vetoing the infamous bills which passed their respective (if not respectable) Legislatures, authorizing the organization of lottery companies. It is cheering to find such executive officers with "the courage of their convictions."

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

GRAIN AND GRASS. — Haywards *Journal*, March 19: Grain all over the valley and in the hills never made such progress as during the past two weeks. Around Mt. Eden and Haywards many early-sown fields are three and four inches high. Grain resown last week is springing up at a great rate. The soil is in fine condition. The feed in the hills was never better and stock is rapidly showing the benefit.

Butte.

EVERYTHING LOVELY.—Oroville *Register*, March 17: Farmers from Chico, Nord, Gridley, Biggs, Durham and Moore Station, in Oroville, this week, as jurymen, report both wheat and barley looking finely and growing rapidly. The fruit trees are in full blossom and promise a fine crop. Vegetables of all kinds are doing well. The mountain roads are fast getting in good condition and travel is commencing.

El Dorado.

COUNTY JOTTINGS. — Placerville *Observer*, March 15: H. H. McClellan, near Grizzly Flat, 2875 feet above sea level, raised last year 10 tons of potatoes, which realized to the owner two cents per pound on the place. On this same ranch are raised all kinds of garden vegetables. Some people think that nothing but icebergs and grizzly bears can be raised in this high altitude; but all fruits save peaches grow to perfection, being of better flavor and keeping qualities than those raised on valley lands. The apples and pears are immense, and sound and perfect, the trees being entirely free from all pests. One firm—that of W. R. Strong & Co., of Sacramento—has, to our knowledge, sold during this season 25,000 fruit trees in our county up to the present time.

Fresno.

SHEEP INTERESTS. — *Expositor*, March 16: Frank Lewis and W. J. Dickey have purchased a band of about 3000 sheep of Wm. Caruthers of Liberty, and Lewis will take charge of them this summer. Sheep are doing well here this season, and the market is advantageous, being about $4 per head for a good grade of animals.

Los Angeles.

THE RYE COMIN' THROUGH.—Los Angeles *Times*, March 16: Six days ago Mr. Johnson, of the San Rafael ranch, sowed several acres of rye. There has been no rain since, yet the rye stood one and a half inches high yesterday. A party of his friends visited the ranch, and when informed that the grain was put in the ground only five days before could hardly believe their eyes.

BATTLING THE BUGS.—Pomona *Times-Courier*, March 19: The local insect inspectors are making a vigorous war on the scale bugs, and all trees coming into this station are subjected to a close examination. In a number of cases the trees have been destroyed. The "white scale" has not made its appearance since found on one tree in the Wolf orchard, which was destroyed.

Merced.

AGRICULTURAL SOCIETY PROJECTED.—Merced *Argus*, March 19: Last Saturday a meeting of citizens interested in agriculture, horticulture, breeding fine stock and in the general prosperity of the county, took place at Leeker's hall. A committee, composed of S. M. Smith, Wm. Mitchell and W. L. Ashe, was appointed to select suitable grounds near town for racecourse, fair ground and experimental gardens, and a Committee on Finance, composed of 24 leading citizens, is to canvass for subscriptions to the capital stock of the association, said committees to report on Saturday, the 26th inst., when it is hoped arrangements will be made to effect a permanent organization.

CHEERING OUTLOOK.—Grain crops have advanced rapidly the past two weeks, and now promise an immense cereal harvest next summer. The acreage in wheat, barley and rye is far greater in the county this year than ever before, an unusually large percentage being summer-fallow, which is considered safe for a crop, even if the future rainfall is light. Stockmen, except in a few localities along the San Joaquin, report pasturage good and all kinds of stock thriving. An unusually large percentage of lambs are reported by sheepmen, and the weather has been so pleasant and grass so good, that flocks are in fine condition, with feed enough now on the ground to carry them until time to drive to the mountain pastures for the summer. The orchards promise a full crop of most kinds of fruit, and the vineyards likewise show up well for so early in the season.

Monterey.

PROSPECTS. — Castroville Cor. *Democrat*, March 17: Crops are looking finely. The farmers are about through seeding and are now preparing the ground for summer crops, such as buckwheat, mustard, and potatoes. With a few spring showers we will raise a good crop in this section.

San Luis Obispo.

HOW THEY GROW.—*Leader:* C. Johnson, several miles west of Paso Robles, has apricot trees five summers old from seed planted in April, which now measure 18 inches in circumference; apple trees seven years old from setting, from trees which were two years old when set, which now measure 22 inches in circumference. Mr. Johnson raises blackberries, and the growth of one bush which he allowed to grow without topping reached the remarkable hight of 16 feet. He also has figs, almonds, grapes and numerous other kinds of fruit, which are all doing remarkably well.

Sacramento.

AMBITIOUS BARLEY.—*Bee*, March 17: Col. McNasser to-day brought to this office a bunch of barley three feet and a half high. The barley was sown on the Riverside road, in January. The heads of the grain are long and well developed, and the Colonel has 50 acres of it.

Solano.

IN CORDELIA ORCHARDS.—Dixon *Tribune*, March 19: F. S. Jones has set out 800 olive trees, and will put out 700 more next year. He has also grafted 600 Centennial cherries on common stock and next year will increase the number to 2000. (They are the large white cherries, used for canning purposes.) I plucked large, luscious oranges from trees in the Batmale vineyard this week. The frost had not fallen upon these trees for seven years. The wonder is that the cultivation of the orange has not become more general in this community.

Tulare.

IMMIGRATION ASSOCIATION WORK.—At a recent meeting of the County Immigration Association, the Visalia *Times* says that Messrs. Morton and Baker, who had lately been in Los Angeles, gave a description of the work going on at the headquarters of the association in that city, under Mr. Ayers' charge, and exhibited photographs of the display. They stated that from 400 to 1000 Eastern people visit the headquarters daily, and all express themselves as surprised at the wonderful productiveness of Tulare soil. Mr. Ayers is kept busy explaining to immigrants the varied resources of the county and the advantages to be gained by settling there. The secretary estimates that it will take $700 per month to maintain the rooms at Los Angeles and pay for the printing necessary to advertise the county properly.

Tuolumne.

CITRUS SPECIMENS. — Julius Pache lately showed a reporter of the Stockton *Independent* several fine oranges, grown in the Reymand Bros.' orchard at Green Springs, Mountain Pass. The oranges were large and peculiarly sweet, and went to prove that fine citrus fruit can be raised in Tuolumne county.

ARIZONA.

RAISIN VINEYARD.—Los Angeles *Herald*, March 19: McPherson Bros., the raisin-makers of Orange, in this county, have just purchased 640 acres of land near Phœnix, Arizona, and will plant the same with Muscat vines. This will cause the setting of about 400,000 vines of the raisin grape.

HORTICULTURAL SOCIETY.—Phœnix *Herald:* At the last semi-monthly meeting of the Arizona Fruit Union a number of new members were reported by the secretary. A very practical and valuable paper by O. F. Thornton, on "Fruit Culture for Profit," was read and discussed. The interest of our citizens in the union is steadily increasing, and it is the aim of its managers to secure a permanent hall for exhibits and meetings as soon as possible.

NEW MEXICO.

STOCKMEN HAPPY.—Vermejo Cor. Raton *Range*, March 7: It is very gratifying to take a trip through our mountain country and note the splendid condition of stock and range. Cows with calves following, old bulls, mares, suckling colts, and in fact all kinds of stock, are fat; and why shouldn't they be? Although the winter is pretty well gone, and new grass will soon be here, there is yet plenty of old grass left for the healthy sustenance of stock. The indications are that the coming calf-crop will be large. We venture the prediction that 80 per cent of the cows on this range will calve this year. Young calves can be seen on the range already, fat and sleek as butter. People feel good over the condition of everything.

OREGON.

IN MULTNOMAH COUNTY.—*Willamette Farmer*, March 18: Fears were entertained that winter wheat was considerably damaged by the cold winds and the freeze, but four sunny days have proved different, and a beautiful green tint has taken the place of yellow. In a few days the plows will be running to get the spring crops in. For the first time in this part of Oregon many of the farmers were out of hay, which caused great inconvenience. Last fall farmers had hay to sell at $7 to $9 per ton; this month the same parties paid $15 per ton. When Oregon farmers learn to economize like Eastern farmers and save their straw and other useful articles, they will never know what want is.

FRUIT PROSPECTS.—It is said that the buds of many fruits, but chiefly peaches, in Southern Oregon were killed during the winter. The Jacksonville *Times* denies that this is generally true of that section, but it is probably true as to the peach both there and here. A paragraph from Wasco county says the late cold spell ruined the peach crop of that section and in some cases the trees were killed. Almond and other tender nut trees were also killed, but general varieties of apples, pear, plum, and prune are all right. The *West Side* says of Polk county that the peach crop is ruined there also; as a general thing Western Oregon—and probably all Oregon—will not have much of a peach crop in 1887. Grapes cannot be injured, as they do not start easily, and as yet all vines are waiting for spring.

Sonoma County Notes.

EDITORS PRESS:—The farmer or Granger who would ask for better growing weather than we have had in Sonoma county the past fortnight ought to be expelled from any agricultural society he may belong to. He is not content with letting well enough alone. Nature could do no more for grains or grasses than has been done so far in the month of March. Live-stock already show a decided improvement, and fat beef and mutton are quite plenty.

Vineyard-work is well in hand. Everybody is through pruning, and many of the smaller vineyards have had the first plowing. Several acres of new vines of foreign varieties have been set out in the county this spring.

It has been proven beyond question that the soil and climate of Sonoma are well adapted to the growth of the olive. Several thousand olive trees have been planted in the vicinity of Santa Rosa. The owners of sheep have had a very favorable winter. There is but little complaint about the loss of lambs. Shearing has not yet begun, but the nomadic "shearer" is getting ready for the spring campaign.

The Santa Rosa Woolen Mill, which has been shut down for some time, is to be offered for sale at auction on Saturday, March 26th.

We have been reading in the daily papers that California is to have a boom. There is no doubt of it, and there is less doubt about the boom that Sonoma county is now enjoying. Never before has property hereabout been in such demand and at such prices. Several very large real estate sales have already been made, and report says that others will soon be completed. Such sales are for the best interests of all concerned. Let the good work go on.

Grain-sowing is nearly finished. Corn ground is being put in order. Hop-yards are flourishing and promise well. Fruit trees are blooming, and the outlook for their crop is encouraging.

Roads are in good condition.

Lumber mills are starting for the summer run.

Santa Rosa is booming in anticipation of railroad communication with the S. P. system at Benicia.

The Sonoma County Agricultural Park Association are preparing for the annual fair at Santa Rosa.

Country schools are in session.

Business is brisk, and getting better.

OCCASIONAL.

Santa Rosa, March 21, 1887.

MUST WORK OR FAST.—The authorities at Santa Rosa are treating tramps, and other offenders in duress, upon the apostolic principle; "If any will not work, neither shall he eat." The *Republican* says that Jailer Breitenbach has put the chain-gang to work improving the Court-house grounds. This is done in compliance with an order of the Board of Supervisors, compelling all petty prisoners to work. The Board has also instructed the jailer to ornament each prisoner who is taken out to work with a heavy ball and chain, and in case they refuse to work, to furnish them with extremely light diet, bread and water. Monday morning two refractory vags declined to work unless the ball and chain was removed. It is quite probable that after two or three days' subsistence on bread and water, they will change their minds.

THE WRIGHT IRRIGATION ACT.—We give in full on other pages of this issue the important law on irrigation, which will henceforth be known by the name of its author, Hon. C. C. Wright, of Stanislaus county. The text which we give will enable all our readers who are interested in irrigation to inform themselves as to what preliminary steps it is necessary to take to secure the co-operation of their neighbors and the approval of all interested in the formation of districts. This measure is regarded as one of the greatest importance in paving the way for a great extension of the irrigated area of the State.

ALAMEDA NOTES.—Our special correspondent made a flying trip through Alameda, to attend the Livermore horse and cattle show. In the valley from Niles to Livermore, there is extensive work going on in laying out new orchards and vineyards, including the planting of citrus orchards. Mr. James Shinn, of Niles, has orange trees which he planted ten years ago from Tahiti seed. These seedlings are now bearing fine fruit without irrigation. A large limb loaded with oranges was exhibited at Niles, by Mr. Shinn, that was pronounced by Mr. John Rock, of the California Nursery Co., a good sample of the orange.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

The Interstate Commission.

The President, after long deliberation, has announced his list of commissioners under the Interstate Commerce Act, as follows: Thos. M. Cooley, of Michigan, six years; Wm. R. Morrison, of Illinois, five years; Aug. Schoonmaker, of New York, four years; Aldace F. Walker, of Vermont, three years; and Walter L. Bragg, of Alabama, for two years. Morrison, Schoonmaker and Bragg are Democrats, Cooley and Walker, Republicans. It is claimed that the interest of the railroads is well represented on the commission.

Rumors are rife of material advance in interstate freight rates, and shippers of various kinds of produce are anxious as to the effects upon the material they handle. The Sacramento *Bee* has gained an intimation of what may occur in rates which we give, on the authority of that journal:

The following is a partial list of freight rates to go into effect on April 4th, when the Interstate Commerce Act will be in operation:

Between California Terminals and	1st.	2d	3d.	4th.	5th.
Missouri river	$4 00	$3 50	$3 00	$2 50	$2 25
St. Louis	4 50	3 85	3 20	2 65	2 35
Chicago	4 70	4 00	3 25	2 75	2 45
Denver	3 00	2 65	2 30	1 95	1 70

Between California Terminals and	A.	B.	C.	D.	E.
Missouri river	$2 10	$1 75	$1 40	$1 10	$1 00
St. Louis	2 20	1 85	1 50	1 20	1 10
Chicago	2 30	1 95	1 55	1 25	1 15
Denver	1 50	1 20	95	85	80

There is a special tariff on the following articles from and to California points and the Missouri river: Beans, $1.40 per 100 pounds; borax, $1.10: canned goods and strained honey, $1.40; hops, $1.75 whale, fish and cocoa oils, $1.10; vegetables, $1.00; barley, 65 cents; wire, $1.90; and oranges, per 100 pounds, $1.00.

The classification under this tariff is very different from that hitherto in vogue, so that it is difficult to say just what the increase will be on any given kind of freight. But the new rates are known to be much higher than the old—in some instances four or five times as much.

This is the tariff as revised by the Joint Western Classification Committee, January 1, 1887. It divides all freight that may be shipped into ten classes, running from 1 to 5 and from A to E inclusive. Its object is to enable the present "short-haul" rates to be maintained undisturbed by the new law. Another tariff has been framed for submission to the Interstate Commission, but it may be 60 or 90 days before any action can be had upon it. This proposed tariff is much lower than the one agreed upon to go into effect on April 4th. Under a liberal interpretation of the law, the lower tariff could be adopted.

Of course, if rates are much raised, the competition by clipper ship and by Panama will come into operation, and much of our produce can go that way.

WE are always pleased to bestow commendation where it is well earned, and to note evidences of business sagacity and enterprise when displayed by the business men of the coast. In this connection Messrs. Jones & Givens, who are becoming more and more favorably known with each season, are particularly worthy of mention. The "Glidden fence-wire," which they represent, is by their activity and energy taking prominent place in that class of manufactures, and can deservedly be said to now occupy a standard position. One thing we are glad to assure our readers, and that is that all we hear of this firm leads us to place full confidence in their statements concerning the "Glidden." To use an old and trite aphorism, "their word is as good as their bond." Especial attention is called to their advertisement in this issue.

PACIFIC BUSINESS COLLEGE.—This old-established institution at 320 Post street is still pursuing its excellent course in preparing young people for business pursuits. Of late there have been considerable changes in business methods, correspondence, etc., and the Pacific College keeps well up in its instruction with all real improvements and progress. The location of the college is one of the handsomest in the city. Full information as to courses, terms, etc., can be had by addressing the principals, Profs. Chamberlain and Robinson.

"FIRST-CLASS IN ALL DEPARTMENTS."—Any one wishing to subscribe for the RURAL PRESS, an agricultural paper published at S. F., a first-class paper in all its departments, can do so at this office. Subscription, $3 a year. If you want light on the subjects of farming, horticulture, etc.—the best authority—now is the time to subscribe.—*Shasta Co. Index.*

THE "Allegretti process" for preserving fruit in bulk has been attracting a good deal of notice among growers and shippers for some time past, and the inventor's advertisement in another column of our paper shows that he is now ready for business.

SIXTY fine oranges have been picked by J. McNeil, residing at 235 San Jose avenue, between Twenty-fourth and Twenty-fifth streets, in San Francisco, from an orange tree growing in the open air in his back garden.

LUSK'S NURSERIES.—We understand that the affairs of Lusk & Co., nurserymen at Temescal, are now being finally arranged and the institution will be closed.

Lines.

[Written for the RURAL PRESS by FANNIE H. AVERY.]

Intense emotions swell within my soul,
Whene'er I view the dark-blue starlit skies;
And ponder on the meaning of the whole,
Spread in immensity before my eyes.

Oh, what a thought! that we may thus behold
That mighty pageant of transcendent worth—
Those suns which lighten satellites untold—
From the small planet where we have our birth.

The glorious sight disperses all my pride,
And yet exalts my awestruck soul on high;
What is the earth to those orbs multiplied?
Yet one may apprehend them weak as I!

A Family Despot.

[Written for the RURAL PRESS by ELSIE ANGE.]

It was in the middle of the forenoon one Monday, and the feminine members of the Masters abode were inhaling an atmosphere freighted with steam and seasoned with odors of soap and sal-soda and other ingredients that combine to make the program of wash-day. Without, the lines were full of linen, bleaching and drying most felicitously in a radiant glow of sunlight. This fact was, of itself, enough to make Mrs. Masters good-natured, for the lines in the neighboring yards were waiting to be adorned, and she loved to be ahead of her neighbors on wash-day. It was so pleasant, after her work was finished, to stand at her windows and criticise their tardy work; and Mrs. Masters was no lenient critic. According to her statement, the clothes in the neighboring yards were a disgrace to be seen and a perpetual reproach to those who pretended to call them washed.

You will conclude that Mrs. Masters was not a pleasant person to have for a neighbor, and as she prided herself upon being a plain-spoken woman, it must be admitted that she was not. Indeed, she had earned the reputation of being a meddling busybody by acquaintances and neighbors; but while the former could drop her, and the latter could move away, there was a class of people that could do nothing but submit to her petty tyranny. These, her relatives, were to be pitied, for she ruled them with a rod of iron. There was no one in the world who would carry in her wake such annoyance and unhappiness as Mrs. Masters, and she gloried in it. Her hand on the bell-knob, her footstep in the hall, were enough to still the happy peal of laughter or the pleasant flow of chat that had preceded her entrance, for she was a literal wet blanket. Nothing was too sacred for her to keep to herself. Family secrets and infelicities were proclaimed by her from the housetop until her relatives' lips became as sealed in her presence as though she were a perfect stranger.

There was one thing Mrs. Masters could not forgive her people for. They had met with *success*. Her brothers were men of influence in the community; her sisters were women of wealth and position. Mr. Masters, now an elderly man, still stood at the blacksmith's forge. He would be always poor and unknown. Mrs. Masters fought against and smarted under the difference between her circumstances and theirs; and she tried to humble her prosperous relatives by accounts of their start in life. As they did not think it was necessary to make explanations about their humble origin and all the whys and wherefores connected with their advance in the world, Mrs. Masters became their mouthpiece, and many a precious bit of gossip was worn threadbare by those of her listeners who were jealous and maliciously inclined.

But we have wandered far away from Mrs. Masters' washroom. Since then, the flannels have been satisfactorily laundried, and have undergone much shaking and snapping preliminary to their suspension in the sunniest part of the yard, for Mrs. Masters especially prides herself upon her "flannins;" and the colored clothes lie in the rinsing water. Then follows a pause as far as the washing is concerned, for a note has arrived which mother and daughter are discussing. It is as follows:

SUNDAY, P. M.

Dear Maria: We hope you are all well, as we have not seen any of you during the past week. Will you and the girls come and take lunch with us on Wednesday? Your affectionate sister,

JOSEPHINE GORDON.

The girls were delighted, for Aunt Josie's was a charming place to visit, and her lunches were always delicious. But while they expressed their pleasure, their mother was meditative. She immediately discerned something behind the note. There was a *motive*, she knew, in sending it, and she would find out what it was if she died in the attempt. No, she had not been to Josie's for a week; and was not the note equivalent to a request that she stay away until Wednesday? Mrs. Masters loved to pop in upon people unawares. And would that note keep her from doing so? Not if she knew Maria Masters. At last she was aroused from her study by the sound of her daughters' voices.

"Yes," Jennie was saying, "we must take mother's plate to the dentist's this afternoon."

"You need not worry about it to-day; to-morrow will do," said Mrs. Masters, promptly. "I am goin' to dress and go out at one't."

"But, mother, you are such a fright, with three of your front teeth gone! You wouldn't go to church yesterday, you know; and your hair looks so thin when it isn't crimped."

But they may as well have talked to the wind. In less than an hour Mrs. Masters was dressed and giving her parting injunctions at the street door.

"Remember you are to have the cold beef for lunch, and what is left you are to stew for dinner. Yes, and make a bread puddin' and be careful of the eggs."

The Misses Masters enjoyed having their mother go off on one of her jaunts. It meant for them something extra for lunch and an easy time for the rest of the day, and also a budget of news when she came home. But it was so late when their mother returned that they were all asleep, and they heard nothing of her day's adventures until the next morning at breakfast. There was an exultant look in Mrs. Masters' eyes as she began her recital:

"Ah, didn't I know that something was in the wind when that note came yesterday? Catch me for not scentin' a secret! First of all, I went to Reuben's. It was onconvenient, but if any one knows what's goin' on at Josie's, it is Alice. For another thing, I wanted a hot lunch after the washin'. Well, I took Alice by surprise. I love to take folks like her by surprise. She is so hightoned and stylish. She opened the door herself, and she had on a faded wrapper out at the elbows, and I could see that she was mad, although she made believe she was glad to see me. And what do you think, she had been washin'! She said her servant had left Saturday and she had been disappointed in gettin' another, and she had washed a few small pieces herself. I looked at 'em and told her they weren't half washed. We had a beggarly lunch—cold meat, that I detest." (Mrs. Masters forgot to mention the chocolate, and fruit and custard, she had done full justice to.) "I gave her a piece of my mind about not havin' good, nourishin' food. I told her no wonder she was pale, that her health and Reuben's would be broken down unless she changed her diet, and she sighed and looked ill-used. But I wanted to find out about Josie, and I asked if she had seen her lately. She said, 'Yes; last Friday,' and I noticed she got nervous; so I knew for sure there was somethin' they wanted to keep from me. I jest looked her through and through, and then I said, in a knowin' way: 'Of course, *you* have been invited to their grand doin's this week.' She colored, and asked what I meant. 'If you don't know, nobody does,' said I. 'But, perhaps, Josie is gettin' above you as well as me.' I knew that would fetch her, and she said: 'Oh! If you mean that I have not been asked to dine with the Somervilles, you are right—I am not acquainted with them.' I had gained a pint. The Somervilles are awful rich, and one day they called on Josie while I was there, and she took good care that I didn't go downstairs to meet them. I thought of it when Alice spoke, and although I was dyin' to hear more I kept mum, and Alice said: 'The Somervilles start for Europe next Wednesday.' Then I knew why we had received the note yesterday. I nodded, as though I knew all about it; and as I love to take folks down, especially proudies like Alice, I asked: 'Where did you pick up that old wrapper? It is only fit for the ragbag.' She said she knew it, and, if I would excuse her, she would change it. In a little while she came downstairs in one of her nobby dresses, and just as she was steppin' in the parlor the bell rung, and it was her minister. I would have given ten dollars if he had caught her in that shabby old rig. He wouldn't come in, and I heard him talkin' about some church affair, and he said he knew he could depend upon her, and my blood boiled. Why do every one make such a fuss over Alice? When she came back I twitted her about lettin' him stand at the door. I knew she didn't want him to see me, and I told her so, and I left her all of a tremble with my plain speakin', and I'm glad she knows my opinion of her.

"I had just got about a block from the house when who should come along in a buggy but Reuben himself! He pulled up to the sidewalk and said: 'Oh, 'Ria, have you been to our house? How did you find Alice?' I told him she was well. 'I am glad to hear it,' said he. 'The poor child looked so pale this mornin' that I'm goin' to take her for a drive to see if it will brighten her up a little.' I tell you it made me mad. He is my brother, and it was his duty to give me a lift and take me to Anna's. But did he do it? He may as well have been a stranger as a brother, so I spoke up: 'Child, indeed! You may as well call her a baby at onct. Why, when I was her age I had five children and no time for drives.' Then Reuben laughed as he always does in his aggravatin' way. 'Ah, 'Ria,' said he. 'We can only expect to find but one woman as remarkable as you in the family. Come again soon. Good-bye.' Did you ever hear of such insolence? Well, it took me a good hour to get to Anna's, and then she was not home. I never saw such a gadabout as Anna, and don't see what takes her out on Mondays. I went upstairs and took off my things, and looked in her closets to see if she had anything new, and for a wonder she hadn't. Then, as I like company, I went down to the kitchen and set with Susan. Well, that poor thing had all the clothes to fold, and the dinner to get, and I don't know what else. I sympathized with her and advised her to strike for higher pay, as Anna's girls were always overworked. I tell you I'm a friend of the workin' classes, and I'm not ashamed to own it. I remember the time when Anna had to do everything herself, but riches have spoilt her. By and by she came in, and she looked as fierce as a meat-ax when she found me with Susan. I knew right away that I would have to play my cards extra well if I wanted to find out anything about Josie and the Somervilles, so I said in a jokin' way: 'Well, Anna, were *you* good enough to be asked to dine with the Somervilles?' I saw that she started; but she said in her icy way: 'No. I am barely acquainted with them.' Then I got up and commenced tyin' on my bonnet, and Anna got excited. 'You are not goin' yet, Maria? Stay to dinner.' But I had made good use of my eyes, and as I'm not over-partial to biled mutton and apple pie, I jest shook my head and declined. Then Anna said, very anxious-like: 'Is there any reason why you should hurry home just now?' 'No,' said I. 'I'm goin' to run 'round to Josie's to see how they are. I didn't see them all last week.' Then Anna got mad. 'I don't see what you want to go there for, when you are invited for Wednesday. You will only put them about; and what do you care for the Somervilles, or they for you?' But I wasn't goin' to be bluffed, 'specially when I had the whole mystery in a nut-shell. You see they were so afraid I would take them by surprise that they got up the lunch to keep me away. Yes, and Anna had had a finger in the pie, as usual. Do you think I would stay at Anna's after that? No; I left her turnin' from red to white, but the ice in her mouth and the fire in her eyes couldn't frighten me, and I wanted Josie's folks to see that they couldn't outwit Maria Masters. Dear me! I never wanted to be rich so badly in my life as I did when I walked through the Gordons' grounds last night. It seemed that *I* ought to be livin' there. That style would jest suit my notions. I imagined it was all mine as I walked up the stone steps and pulled the bell; but I did not feel so when that saucy mulatto boy showed me in with one of his condescendin' grins. I could jest read his thoughts in his impudent face: 'Here comes the poor relation!' So I gave him a scornful glance, and walked upstairs to surprise them. At last, after I had opened half a dozen doors, I found the girls. They were all rigged up, and were laughin' as usual; but they sobered up quick enough when they saw me. You would have thought I was a whale or somethin' terrible, the way their mouths fell and their eyes stared. Instead of runnin' to meet me, and takin' off my things, they opened their mouths and screamed: 'Mamma! O mamma! Here is Aunt Maria!' Then Josie came in all dressed up in ruby velvet and cream-colored satin, and her face covered with mustache powder."

["Pistachio, mother," corrected Della Masters.]

"Well, it is all the same. I wish you would not interrupt me. What was I sayin'? Oh, yes—Josie came in. 'Why, Maria,' said she; 'didn't you get my note?' 'What note?' said I; 'I have been out all day.' I don't think it's wrong to fib when folks are sly and underhanded. Then Josie sighed, and for the first time I felt a little sorry. Alice is all gentleness and tears, and always acts as though she is a pigeon in the clutches of a hawk, and I detest her for it. Then Anna is all ice and fire, and only her dignity keeps her from fightin', and I have no pity for her. But Josie is so mild and sweet-tempered, and she can jest make you feel mean with a word or a look. She some way reminds me of my mother. So I said I was sorry if I had come at an onconvenient time, and I would go. The girls looked so pleased that my blood began to bile. I felt like givin' them a piece of my mind; but Josie spoke up: 'No, you must stay, Maria, as we have dinner in half an hour.' I went down to the parlors and set where I could see the rich folks; and when their carriage came rollin' up the drive and I saw the pompous coachman, and the genteel footman, and the carriage stopped at the steps, I did feel so peculiar! The chills chased each other up and down my spine; there was a buzzin' in my ears and a mist before my eyes. I suppose I was frightened. Then I thought of so many things that never troubled me before. I thought of my missin' teeth, and my thin hair, and my hands puckered with the washin', and I wondered if I would make many mistakes when I talked. I would have bolted from the room, but I felt as though I was glued to the chair. This all lasted until I heard Josie sayin', 'My sister—Mrs. Masters,' and I found myself shakin' hands with a very sober-lookin' man and a plain little lady, then two young dudes and a stylish girl, and we all went to dinner. I was surprised to find such plain fare for rich people. There was soup, roast beef and vegetables; and for dessert, fruit, sponge cake and floatin' island. There was no wine, and Mr. Somerville took neither tea nor coffee — simply a glass of water. I guess we were a couple of hours at the table, and they talked and acted just like common folks. After dinner I asked Josie why there had been no extrys. She said the Somervilles were strictly temperate people and believed in simplicity. I wanted to ask more about their stingy notions, but Josie didn't give me the chance. We had rather a pleasant evenin'. The young people played and sung and had a dance. I sat next to Mrs. Somerville for awhile; and she was such a nice, chatty little body I felt just as easy as I did with my own folks, only I did not fancy the way she looked at my teeth. I said at last: 'You see I have met with a mishap. Do your teeth ever break?' She said no, and did not seem to feel complimented because I thought she wore false teeth. She admired Josie very much and said it didn't seem possible that she was the mother of her girls. 'Yes,' said I; 'she believes in fixin' up. Now, I am 50 and am not ashamed to own it. I think it is poor taste for women of her and my age to wear such young colors.' Mrs. Somerville stared, and I felt like tellin' her a few things that would make her open her eyes; but Marie and Frankie came up—the impudent minxes!—and changed the conversation. They were afraid that I would let out that their mother was learnin' the dressmaker's trade when she got married, and that their father kept a shabby little machine-shop, and the house where they began housekeepin' could stand in the middle of the drawin'-room. I would love to take those upstarts down a peg or two; they need it. Then we got lookin' over some engravin's. I saw Mr. Somerville was very attentive to Josie, and so were the young fellers for that matter, and her husband was admirin' her as usual, and I thought she needed takin' down, too; and I asked her if she would lend me her glasses, that I had left mine home. And would you believe it, her husband burst out laughin' and said: 'Now, that is pretty good!' Then he rubbed his hands and laughed louder than ever, and they all started in, and you'd have thought I had got off the funniest joke in the world."

"But, mother," interrupted Jennie, "Aunt Josie is 14 years younger than you, and she does not wear glasses."

"She will need them soon enough," answered Mrs. Masters, grimly. "I was indignant when they all laughed at me. It was because I am poor; but every dog has his day, and perhaps mine is comin' by and by. There is nothin' hurts me like ridicule, and I was pretty quiet after that. I think Josie knew my feelin's were wounded, because when I was leavin' she slipped $20 in my hand and told me to get my teeth fixed. Mrs. Somerville was very nice, and said she hoped we would meet again; so I shall call on her when she returns from Europe. When I got downstairs I found a coupe waitin' for me; and jest as I was gettin' in I discovered that I had left my purse. I always like to leave somethin', for it gives me a chance to hear what people say behind my back. So I stole upstairs very softly and saw Mrs. Somerville with her hand on Josie's arm, and she was laughin', so amused-like while she talked; and I heard her say: 'She is as like my cousin as two peas. I was thinkin' of Julia all evenin'. She is the aristocrat [autocrat] of the family, and makes us all stand round.' I knew she was talkin' about me, but before I could catch Josie's answer, that officious Marie came bouncin' in with my purse, and I was obliged to go. But, mark my word for it, I'll find out who that Julia is; yes, I'll move heaven and earth, but I'll get track of her and see if she is onfortunate enough to be a poor relation."

I flung a stone into the air,
Where it might fall I did not care;
For who is not tempted, sometimes, to try
How far he can make a pebble fly?
I breathed a curse into the air,
And thought that none would hear me swear.
For who can hear through a two-brick wall
The wrathful words a man lets fall?
Two days later, nearly dead,
I found a tramp with a broken head;
And I heard the oath repeated with glee
By my youngest child, a girl of three.

—*Detroit Free Press.*

EUROPE'S best dressed woman is said to be the Princess of Wales. She dresses not only well, but sensibly. She has never adopted the voluminous crinolet declared necessary by French *couturieres*, because she is too wise to cumber her elegant form with such a monstrosity. What mother would not lament if her young daughter grew up so shaped that the fashionable tournure was unnecessary? The dresses of the Princess always fit to perfection, but they are cut to suit the lines of her figure and not according to the styles of the day. Her clothes look part of herself.

ORIGIN OF HIGH HEELS.—Many years ago the Venetian ladies wore a ridiculously high heel, accompanied with a high clog of white leather, stamped with a gauffering iron and slashed, but closed at the point. It is said that this style was invented so that the ladies would prefer to stay at home. Some shoes were made so high that a grand lady on her visiting tour would have to be supported by a waiting-maid on either side.

SHOES AT A CENT A PAIR.—A retail shoe dealer of Indianapolis advertised in an evening paper to sell shoes the next day at a cent a pair. He sorted out a large number of mismated, damaged and other shoes and rubbers for the sale. A crowd of several thousand people gathered, the police interfered, drove them away and arrested the proprietor.

A Philanthropic Californian.

California can boast of many enterprising and intelligent women, as well as men. It is a well-known fact that not a few of her women have established and successfully managed some of our foremost institutions. They have built up reputations in literature, law, medicine, and the arts and sciences, and are fast crowding upon other occupations heretofore held by the sterner sex. Find a well-established and prosperous place of learning and you will discover that a woman has a hand in its management, and further investigation will show that it is through the untiring work of women that the hospitals, the kindergartens and the charitable institutions and churches are kept going. Prominent among this band of workers for the good of her neighbors is Mrs. Annie K. Bidwell, of Chico, wife of General John Bidwell. She was born in Meadville, Pennsylvania, June 30, 1839. She was raised in Washington, D. C. She was married in 1868. When Mrs. Bidwell came to California, a feeble effort was making for the instruction of the Digger Indians on Rancho Chico. She came to the rescue in 1875, and determined to take full charge of the Indians. From day to day she assembled them in a small room and began the task of teaching them to read and write. Mrs. Bidwell had texts of Scripture painted upon canvas, and these were tacked around the schoolroom. They were used for the double purpose of instructing the Indians in religion and teaching them their letters and to spell and read.

She also taught them in the arts of civilization. She would cut out and fit garments and teach them to make them. Men came in search of learning as well as women and children. On each "lesson day" the exercises would be opened with singing and repeating the Lord's prayer in concert. She also taught them simple prayers embodying their wants. Mrs. Bidwell almost daily visits the Indians in their cabins at the rancherie. In 1882 she had a small chapel built for them on the ranch, and in December of that year it was dedicated by Rev. E. Graham, of the Presbyterian church. Mrs. Bidwell goes there daily except Saturday and teaches from 8:30 to 11:30 A. M. Services are held every Sunday forenoon. Of naturally a timid disposition, it required great moral courage to assume the role of a preacher, for her service was a real service and her religious instruction was a real sermon. Nothing but an overwhelming sense of duty could ever have impelled her to or sustained her in it. She has convinced the Indians that she is their friend, and they worship her. They go to her with their every want, and in the childish simplicity of their untutored natures they take to her even their little family troubles. Perhaps no one on the American continent has so completely captured the confidence of the red men of the forest. The Indians have taken such great interest in their studies that at last Mrs. Bidwell has secured the co-operation of the Presbyterian Board of Women's Foreign Missions, and they have made an appropriation for the employment of a teacher. During a recent visit of a *Bee* representative to the Bidwell ranch, he learned that a new site had been selected for the erection of a larger chapel and school building.

Mrs. Bidwell officiates at all the Indian funerals and buries their dead, and sometimes when she has offered her simple prayer and given the order to fill the grave, the relatives will, with streaming eyes, beg her to offer one more prayer. She has got the men to a most advanced state of civilization, for they have cultivated a liking for music and organized a brass band, the musicians having given a number of public concerts.

And yet Mrs. Bidwell has not devoted her whole time to the Indians. She has been active among her own people, and has done great good. She was one of the organizers of the local Women's Christian Temperance Union, and was for years at its head, taking a leading position at home and attending important sessions abroad. She has also been an energetic worker in the Ladies' Relief Society. There is scarcely a day that she does not drive around among the poor people of the community to learn their needs and to assist them, and she is lavish with her donations of food, wood and clothing. Mrs. Bidwell lives only to do good, and yet she goes about her deeds of kindness in a quiet way.

A PAPER CHIMNEY.—A large factory of Breslau, Germany, required a chimney 54 feet in hight. Instead of constructing the chimney with bricks, as usual, a large number of solid blocks of paper firmly compressed were made use of. These blocks were placed carefully one on the top of the other and joined together with a special cement. The chimney is non-inflammable, is very elastic, and is by the nature of the material quite secure from lightning, which so often plays such sad havoc with the more ordinary sort of factory chimney.

ADVERTISE.—This word is traced back to the early part of the fifteenth century; but in those times it was used in the sense of advert as well as in that of inform. In the seventeenth and eighteenth centuries it was uniformly pronounced with the accent on the middle syllable, advertise; subsequently, advertise became universal; the present tendency, says Dr. Murray (in commercial usage, at least) is to say *advertise*, apparently after the verbs in ize.

YOUNG FOLKS' COLUMN.

Song of the Meadow Lark.

[Written for the RURAL PRESS by NAOMI CLAYTON.]

Oh, come and see
The feast so free
God in mercy sendeth!
My thanks I bring,
I sit and sing,
"Come and find where I am."

To deck the feast
To bird and beast,
Colors bright He blendeth.
The flowers gay—
With me, they say,
"Come and see where I am."

Though short my note,
From my yellow throat,
Praise I pour forever.
Songs rise and fall;
Thus say we all—
"Happy be where I am."

Immortal man!
Try if you can
From your vices sever.
For bird and flower
Ask every hour,
"Are you pure as I am?"

Livermore, Alameda Co.

A Letter to the Young People.

[Written for the RURAL PRESS by HUBERT C.]

I thought I would interest the young people by writing them a letter. I live in Poway, about 22 miles from San Diego. I have two brothers, Clifford and Howard. Howard is the youngest and I am the eldest. Our valley is a very pretty one. Flowers, trees and grass grow on the hillsides. Along the creek large sycamores grow. There are hawks and buzzards' nests in some of them. We have a store, a hotel, two churches, the Methodist and Baptist, etc. There are many other things I would like to tell about, but I haven't time.

Poway, Cal.

What a Boy Did.

What boys have done, boys can do. There are many instances recorded where both boys and girls have done notable deeds when emergencies have arisen which call for them. The latest account of this kind which comes to our notice is the following from a Western New York newspaper:

There is a farmer boy over in the town of Phelps who is, indeed, a model of industry, and is bound to make a sterling citizen. He is 17 years of age. His father died two years ago, leaving a wife and four children, and a mortgage of $1800 on the farm. The boy was the oldest of the children, and the funeral was scarcely past before he set resolutely to work to help the family out of their financial embarrassment. With the advice of a kindly neighbor, he has since been the sole manager of the farm of over 90 acres. He has, with only a little assistance, plowed the fields, sowed, cultivated and reaped; he has had sole charge of a large number of cattle and horses on the farm; he has managed a retail milk business, and has himself marketed all the farm products. Last summer he found time, after his work in the fields, to paint the house twice over and to build five new fences. In the winter he not only attends to the necessary work about the farm, but teaches a country school three miles away, fells timber in the woods on Saturdays, writes excellent letters to the local newspapers, and pursues the course of reading as laid down in the *Chautauquan*. The farm is not only out of debt and in splendid condition, but the lad and his mother have enough money on hand to buy 20 more acres of land this season.

A Smart Girl.

Some one in Texas who signs himself "Bill Amnock" writes to the *Housekeeper:* I must tell you of our Lena. She is a child of 12 years; born in Georgia, of Swedish parents. Her mother has been a domestic in our family for 15 years. Lena gets up every morning at five, feeds the chickens, builds the fires and goes to the stable. Our horse, Nellie, a full-blooded Mexican mustang pony, is handled as well by her as myself. She feeds and waters her, then takes the pitchfork and cleans the stable; will take the brushes and rub Nellie while she is eating—singing and talking to her all the while. Nellie seems to enjoy her company. Once while at dinner she overheard us say we would drive Nellie directly after dinner, and wishing to please us, quietly went to the stable, put the harness on, and not being able to reach her head, climbed on a box and succeeded in placing the bridle, after which Nellie was backed into the shafts and hitched as well as any one could have done it. Lena thinks of more mischief in one hour than any three girls in Texas. One time a large basket of partially decayed fruit was left in her reach, when she ate two oranges, eight apples, several bunches of grapes and topped off with some watermelon rind. That night we stood around poor Lena's bed with hot water whisky, peppermint, salts, liniment, mustard plasters, etc.; but to our surprise she was with Nellie in the morning as usual. Any girl who can stand such food and take care of a horse and never say die, will survive the Dengue fever, smallpox and cholera.

GOOD HEALTH.

TASTE AND SMELL—TWO SENSES, EACH USELESS WITHOUT THE OTHER.—Scientific men inform us that we can distinguish only some six varieties of substances by taste. These are the bitter, sour, sweet, saline, alkaline and metallic. Others enumerate simply the sweets and bitters, acids and salines as the four varieties of savors we are able to distinguish. The rapidity with which different substances may be perceived and appreciated by the sense of taste varies greatly. For example, salt ranks highest on the list. It can be tasted in 0.17 of a second after its application. Quinine, with a much more persistent flavor, requires but 0.258 of a second for its appreciation by taste. Bitters do not rank highly in the matter of food appreciation. Sours and sweets come certainly within the range of taste. We have acquired a habit of referring every sensation about the mouth to taste, whereas, in reality, it is argued by the London *News*, smell has more to do with the matter than is really believed. Even in the case of sweets and sours, it can hardly be denied that these are to be distinguished more by a combination of smell, taste and touch than by taste alone. Again, we discriminate degrees of sourness by smell in a ready fashion, and such degrees may be tested and distinguished by the more delicate smell when taste lags woefully behind in the work of discrimination. Perchance it is the pure sweet savor that taste has the right to assume as its special province. Yet "lengthened sweetness long drawn out" will soon weary the palate unless it is linked to some other flavor in the distinction of which smell may play a part. Children will weary of plain sugar, while the flavored candy attracts them more powerfully; and this is a proof of the argument that it is to smell and to its aid in tasting that the higher sense of gratification is due.

HOW TO PREVENT THE SPREAD OF SMALLPOX.—Although there is no contagion more powerful or certain, experience has taught that the spread of smallpox may be absolutely prevented by a strict observance of rules prepared for the protection of infected districts. On the first report of the existence of a case, systematic vaccination or revaccination of every person exposed should be at once resorted to. Whenever it is known that any person is sick with smallpox or varioloid, isolation of the individual should be promptly and rigidly enforced. Any accumulation of filth or refuse of any kind about our premises should be at once removed, and disinfectants freely used. A strong solution of copperas (sulphate of iron), alum—in the proportion of two or three pounds to a gallon of water, or combined with carbolic acid made by mixing eight pounds of dry copperas and a pint of carbolic acid in five gallons of water, and stirring the mixture briskly until dissolved, is good to disinfect all kinds of drains and foul places in houses, stables and yards.—*Ventura Free Press.*

THE SNEEZING SPOT ON OUR HEADS.—As a *Journal* representative sat in the chair of a Maiden-lane barber the other day, the genial artist of the brush observed that the journalist sneezed when his hair was combed. "Did I touch the sneezing spot?" inquired the barber. He then proceeded to explain that the "sneezing spot" was a sensitive place to the left of the middle of the forehead. "Why," said he, "there are men who come in here who sneeze regularly every time I comb their hair or shave them just as soon as the comb passes over that spot. I had a man in here yesterday who sneezed three times just as hard as he could, all because I touched the 'sneezing spot.' It must be a very small nerve that tickles the nostril."—*Albany Journal.*

ONE FATAL DRINK OF WATER.—In the *British Medical Journal* is reported the case of a family which was stricken with typhoid fever, after drinking *once* of water from a contaminated well. They had rented a house at a fashionable resort, and were then warned that the water was dangerous. Accordingly, no member of the family used the water until the last day of their stay, when, the artificial water they had been using being exhausted, the wife said: "For once, surely, there can be no harm in drinking the well-water." Out of nine persons who partook of it, six died, and, on examination, it was found to contain the bacilli which cause typhoid fever.

TO DESTROY SENSITIVENESS.—According to Dr. Brown-Sequard, one has only to harden the neck and feet and destroy their sensitiveness to prevent taking cold. This is done by daily blowing a stream of cool air, by means of an elastic bag, upon the neck, and by immersing the feet in cool water. The air is at first only slightly cool, but is each day made colder, until the neck can stand an arctic blast with impunity. The feet are immersed in water which is at first at a temperature of about 90 degrees Fahrenheit, and this is gradually reduced to 30 degrees Fahrenheit.

DOMESTIC ECONOMY.

BAKED EGGS.—Put a tablespoonful of butter in a pieplate, and set in the oven until it melts and begins to smoke. Take it to the table and break six eggs one by one into a cup, pouring each in turn into the melted butter carefully. Sprinkle with pepper and salt, put a tiny bit of butter on each and set in the oven to bake until the eggs are "set," that is, when the whites are firm and yolks skimmed over, but not hard. Four minutes in a quick oven should do this. Send to table at once. If you have a few spoonfuls of nice chicken gravy you can strain and use it instead of butter.

POTATOES A LA ROYAL.—One pint of hot, boiled potatoes, a generous half-cup of cream or milk, two tablespoonfuls of butter, the whites of four eggs and the yolk of one, salt and pepper to taste. Beat the potato very light and fine. Add the seasoning, milk and butter, and lastly the whites of the eggs beaten to a stiff froth. Turn into a buttered escalop dish. Smooth with a knife and brush over with the yolk of the egg, which has been well beaten. Brown quickly and serve. It will take 10 minutes to brown. The dish in which it is baked should hold a little more than a quart.

HINTS ABOUT POTATOES.—Old potatoes, such as one sometimes has in the months of April or May, can be rendered less watery by a very simple process. When about to dish them, take one at a time in a coarse towel, and squeeze it as hard as possible. Then lay it carefully in the dish. New potatoes should always be boiled in hot water, and with the skins on. These may be removed at the moment of dishing; sprinkle on salt as you lay them in the dish. Some persons scrape the skins off before boiling, but on no account should they be peeled.

COOKING SMELTS.—Soak smelts in warm water for 15 minutes, then scrape then. Remove the long dark vein that runs through the body, by gently pulling off the head, first loosening it slightly with a knife. After this, rinse them, and lay them in a cloth to dry. Then roll each in a plate of cornmeal. Fry them delicately in deep lard (or enough to half cover them) boiling hot when they are put in, and kept so till the fish are brown. Sprinkle them with salt when you dish them; if put on when you begin to cook them, they will not brown.

BOILED COD.—A codfish is so much thicker at one end than the other that it is impossible to have all parts evenly cooked in boiling. So it is a good plan to cut the fish in half, boiling the head and shoulders (the thickest part) for dinner, reserving the thin end to broil for breakfast the next day. It will keep if sprinkled thickly with salt on the inside.

POTATO PUDDING.—One pound of potatoes (after they are boiled and strained), peel before boiling; one pound white sugar, three-fourths pound of butter, six eggs, yolks and whites beaten separately; the whites must be stiff enough to stand alone. Flavor with vanilla. Bake in a crust without a top. If it browns too rapidly in baking, cover with a greased paper.

BAKED INDIAN PUDDING.—Stir boiling water thick with cornmeal, cook a few minutes, take from the stove and stir in sweet milk until it is thin like gruel, salt and sweeten to taste. For a two-quart basin full, three eggs well beaten and one-half a nutmeg, piece of butter size of egg. Bake one hour in a slow oven. This is an old-fashioned pudding, but very nice indeed.

JELLIED ORANGES.—Cut a small round piece from the blossom end of each of six or eight oranges, and scoop out the pulp very carefully, so as not to widen the hole, or tear the inside of the fruit. Use your fingers and a small teaspoon for this purpose until the oranges are empty and clean.

ASSOCIATION CAKE.—Two cupfuls of sugar, one and a half cupfuls of butter, four eggs, one cupful molasses, one cupful of milk, five cupfuls of flour, one pound of currants, one teaspoonful of soda, one-half pound of citron, one ounce of mace, one teaspoonful of cloves and cassia, mixed.

TO WASH POULTRY.—Fill the inside with cold water, holding it over a pan. Keeping the hands over the openings, shake hard. Rinse it in this way in several waters. In next to the last it is well to dissolve one teaspoonful of soda, if there is any sourness.

BEATING CAKE.—Beat from the bottom of the mixing bowl with a wooden spoon, bringing it up full and high with each stroke, and as soon as the ingredients are fairly and smoothly mixed, stop beating, or your cake will be tough.

COFFEE BLANC MANGE.—Soak the gelatine in a cupful of strong, clear black coffee, instead of cold water, and proceed as with plain blancmange, using no other flavoring than the coffee.

COOKIES.—One cup of butter, two cups of sugar, three eggs, two teaspoonfuls each of baking powder and boiling water, and flour enough to knead as soft as can be rolled out.

The Week.

The week has included several really summery days and the advance of vegetation has been wonderful. Early fruit trees are clad with bloom in many parts of the State, and in the earliest regions some fruit has set and apparently started well on its way. There yet remains, however, a little margin of danger, as the frost season is still on. The 10th of April generally brings safety in some parts, while in others, of course, the dangerous season reaches considerably later in the year. So far all accounts favor good orchard crops, and the growth of grass and grain is all that could be asked and the growth of weeds all that could be deplored. At the close of last week there were showers over a considerable area of the State. Weather prophets predict quite a liberal downfall in April. It will not take much to carry the grain and hay yields to large figures.

The incoming of visitors and home-makers still continues. The activity of California real estate, as shown by telegraphed sales from various points, is something phenomenal. It might be well to inform all Eastern friends to come soon if they hope to get a small piece of California. Laborers, who wish to work, seem to be fully employed, and complaints from the unemployed, this winter, seem to be conspicuous by their absence. Everybody is busy, everybody is happy and hopeful. It is fun to live at such a time and in such a place.

Country Milk.

In the issue which has arisen in this city between country and city milk, our convictions and sympathies are naturally very strong in favor of country milk. The field is the place for a cow; the rich, succulent growth of the pasture is naturally her chief pabulum. Freedom of movement, abundance of fresh air and the fragrant cleanliness of the field, are factors in her health. The very fitness of things calls for fresh milk in bright, clean cans, transported in the speediest manner from the beautiful country to be set forth in crystal pitchers upon the breakfast-tables of the city. But it may be said these considerations are mainly sentimental.

We believe, in this contest between country and city milk, that the whole interest and sympathy of city consumers should be with the country producers. These country dairymen have given years of time and the greater part of their earnings to the improvement of their pastures, the improvement of their stock, the improvement of their buildings. They have spared neither time nor expense to secure the most nutritious and wholesome food for their cattle, and the best means of caring for their milk so that it will reach the consumer in the best possible condition. All this they have done because they are devoted to their business and discern that the way to achieve success is to merit it. But it may be said, these people are your friends and your advocacy of their claims is therefore self-interest.

We do not suppose that many purchasers of city milk are readers of the RURAL PRESS. We have many readers in the city, but they are people who have country interests, or hope to have, and they cannot easily be deceived by poor milk. Still the subject is one of the highest and deepest importance, and we desire to have our opinion in the matter put plainly upon record.

In the first place we wish to state our conviction that there are well-kept cows within the limits of San Francisco, and that they produce wholesome milk. With these, of course, we have nothing to do. It is rather with the hosts of swill-milk concerns, in which many cows are kept confined in narrow area, polluting the air by their accumulating and fermenting excrements, drinking water from foul holes or troughs, huddled together in reeking sheds, breathing poison in the putrid air and excreting it with their milk. It is of milk drawn from such filthy and diseased kine and allowed to stand in such pestiferous sheds to absorb fresh doses of poison, until the cans are filled for the wagon. It is of pails and cans rinsed out in foul water which poisons instead of purifies, and with the accumulated filth of months festering in the seams of the vessels. It is of such pails and cans set out on manure-piles so as to be, forsooth, purified in the sunshine—the sunheat, but contributing to faster decomposition and pollution. Such things as these were discovered by a gentleman of this city who was advised by a friend to examine the dairy which supplied him milk which he bought as specially good for his baby.

It was hoped, inasmuch as the City Board of Health seemed disposed to take hold of the question of the city's milk supply, that something effectual could be done. The Board was not altogether fortunate in its methods, and did not seem sincere in its treatment of the matter afterward. It was shown, however, that tuberculosis did exist among the city dairies, and that point should be enlarged upon for what it is worth. People generally do not know how direct and dangerous is the menace to human life from the use of milk or meat from tuberculous animals. There is plenty of literature bearing upon this subject, for the facts have been fully demonstrated. At an agricultural conference of the region about d'Agen, held under the auspices of the Agricultural Societies of Lot and Garonne, in d'Agen, May 19 to 22, 1886, an address on the subject of "Tuberculosis" was made by Prof. Peuch, of the Veterinary school at Toulouse. The speaker at first proceeds at length to describe the disease and its pathology. The conclusions of the address relate to the communication of the disease to other animals and to the human species, and from this part we desire to present a translation of a few paragraphs:

The bronchial mucus, analogous to the sputa of tuberculous persons, is ejected from the nostrils of diseased animals, and falls upon the forage or into the water and contaminates them. It is in this way that animals confined in the same stable or the same pasture, drinking from the same sources or receptacles, become tuberculous. Thus, little by little, insidiously the microbe proceeds on its destructive work and at last produces the formidable lesions in the lungs, which I have described as characteristic in advanced cases, and which swarm with those microbes, which are the essential agents of the contagion.

The diseased material of the lungs or liver of tuberculous animals may communicate the disease to swine which are fed upon them. The marks of the disease thus intentionally produced in a hog are identical with those in hogs having contracted the disease naturally, and the lesions in their organs are the same as those found in the lung of a tuberculous ox.

The danger to mankind from the eating of tuberculous pork is also imminent. This disease is, however, reduced by cooking the meat. In experiments with the juice of meat heated 45° to 80° Centigrade, not one case of disease was produced; but cooking must be thoroughly done, for sometimes the interior of a piece of meat is not heated enough to kill the microbe in the ordinary process of cooking.

There is another means of communicating the disease that I ought to signalize, and that is the use of milk from tuberculous cows. This liquid can transmit the disease as well as the blood of meat, but when boiled, the contagious properties are destroyed as they are in meat when well cooked. Thus the transmission depends much upon our method of preparing food, but owing to people's taste and fashion in cookery, it is impossible to require that all milk be boiled, or all meats thoroughly cooked; hence it is necessary to inspect carefully all meat from slaughter-houses in order to do away with the eating of meat from animals in which tuberculosis is to a degree advanced, and in condemned animals the tuberculous organs, which are the seat of the disease, and the adjacent ganglia, should be destroyed.

It is equally necessary that the dairies should be subject to sanitary inspection. The chances of contagion would be diminished if the numbers of tuberculous animals can be reduced. In this connection I must remark that tuberculosis is contagious in animals as in man, hence a breeder should select with care healthy parentage.

Fortunately, the evolution of the disease is considerably influenced by the surroundings in which the animals live; that is to say, the hygienic conditions in which they are placed. Thus, when animals carry in themselves the tuberculous germ, or even when this germ or tuberculous microbe which penetrates their organs, perhaps by the air which they breathe, or, above all, by the food that they eat, this microbe may in some way remain latent in the organism, when it is not able to overcome the resistance which is in the tissues when the animals are put to moderate work, and if they are well nourished and kept in well-aired stables. On the other hand, if the animals are overworked or ill fed, or if weakened by being milked too long or frequently without sufficient food, then the tuberculous germ multiplies and invades their organs and destroys them. Thus the hygienic conditions and good care are of the greatest importance in preserving the health even of those subjected to the contagion.

In this calm statement of the dangers of using milk from cows suffering from consumption, one can clearly see the peril in which milk-buyers are placed when they use milk from ill-kept dairies. It is also shown under what conditions the disease is promoted. There are many dairies in this city which fully answer the needs for dissemination of tuberculosis. No spasmodic investigation will cure the evil. There must be constant inspection to the end that dairies be well kept. Not till this is done will one be safe in buying city milk without seeing for himself whence it comes.

Silk Culture.

The State Board of Silk Culture held its monthly meeting at 21 Montgomery avenue, S. F., March 19th. Present—Messrs. Carter, McDonald, Sellers and Trumbull, and the Secretary, Mrs. Rienzi.

A shipment of 50 ounces (about 200,000) silkworm eggs, now on the way hither from Italy and France, is expected about the end of this month and will be distributed to the numerous applicants free of charge, according to the order in which their requests were received. These eggs, which were raised by the cellular system, have been microscopically examined and certified pure. They will, it is said, produce white cocoons.

There are still a few cuttings of the white mulberry on hand, although they have been in great demand.

Two new reeling machines have been ordered, at $150 each, for the use of the reeling school, and last year's experiment of raising cocoons at the filature will be repeated.

The Cogswell Polytechnic College.

It gratifies and cheers us, from time to time, to find men of wealth, who deem themselves put in trust with their property for noble purposes. To the list of those who dedicate their abundant means to humane uses during their lifetime—the list on which the names of Peter Cooper and George Peabody have long been eminent, and where that of Leland Stanford has lately gained an honored place—is now to be added that of Henry D. Cogswell.

During the past week, Dr. Cogswell (who is already somewhat widely known as the donor of public drinking fountains to several cities) has founded an institution for educational beneficence. Desiring to put his ample fortune to some use which shall greatly bless mankind, and with this object in view, he has been for months consulting with other philanthropists and with leading educators. The result is that on Saturday last he deeded large realties, roundly valued at over $1,000,000, to a Board of Trustees, for the purpose of establishing and maintaining in the city of San Francisco a polytechnical college, which shall enable Californian boys and girls over the age of 14 years to acquire a practical training in the various industries by which it is possible to make an honorable and comfortable living.

In addressing the assembly of friends called to witness the transfer, Dr. Cogswell said:

"The education that does not prepare one to intelligently direct his labor is not worthy of consideration. We are sorry to say but little effort is made in our present system to prepare children to use their knowledge in assisting them to gain a livelihood. Most of our boys and girls have no occupation and are not fit for one when they leave school. They have learning, but no capacity. The time has come when this should be changed. The nineteenth century calls for the training of the eye and the hand, and stamps it as just as important as the study of grammar, geography, and arithmetic. Educated working men and women are necessary to solve the great labor problems that will arise in the future. For the purpose of this education there is room and need for technical schools in all quarters of our country. Mental industry can exist only along with physical industry; hence the true school should give both mental and physical culture. For the purpose, then, of providing the boys and girls of the State with a thorough training in mechanical arts and other industries, we have made the grant, as set forth in these papers, providing for the founding and maintaining of the Cogswell Polytechnical college. I present them to you, believing that you will faithfully execute your trust to the best of your ability."

The trustees named in the trust-deeds are Moses Hopkins, Charles B. Stone, H. D. Cogswell, Caroline E. Cogswell, Mrs. E. M. Arnold, James G. Kennedy and Thomas B. Bishop. The deeds contain a condition that the trustees establish and maintain the school according to the idea of the donor, and provide that they shall not sell nor mortgage the property, but shall support the college from the revenues derived therefrom. Dr. Cogswell also proposes to give the trustees $60,000 in cash, wherewith to commence operations and erect suitable buildings.

The trustees, all of whom were present, accepted the trust, and pledged themselves to carry out its provisions.

On Monday the trustees elected Dr. Cogswell president, Mrs. Arnold secretary, and Mr. Stone treasurer, and appointed a Committee on By-laws.

Chas. Geddes, the chosen architect, is already at work upon the plans of the buildings, which will be at Twenty-sixth and Folsom streets. We refrain from giving further details to-day as to the elaborate structures and courses of study proposed; and will merely add that the trustees hope to have the school actually open by January 1, 1888, with accommodations for 200 pupils at the outset.

THERE is little mention made of smallpox since the State Board of Health provided for quarantining the Mexican border, and the alarm seems to have subsided.

Osier Willow.

As we have already stated in the RURAL, there is a certain amount of basket willow grown in this State and sold to the San Francisco basket-makers. We are not aware how large an amount the local market would stand, but probably considerable more than is now grown, and as our population is now increasing rapidly, the demand for willow-ware may be expected to increase, and basket-weaving establishments may be opened at various centers of population and trade. There is certainly quite a large amount of imported basket and other willow goods which should be supplanted by local manufacture.

The growth of osier willow is an industry which it would seem might be profitably undertaken by those who have families disposed to help at light work and thus help toward the general income. The cutting and peeling of willow is nice, clean, easy work, and does not require the amount of skill and close attention demanded by some other industries which are proposed for the household. The willows do not suffer from mites or disease; they do not have to be fed or sheltered, and the peeling may be done during storms when out-door work is impossible. These points are not new; we have mentioned them before. They are especially called to mind at this time by an account which we see in the *Southern Planter* from a correspondent who visited the basket-willow district of Western New York in January last. We quote as follows:

In January, while attending the New York State Cidermakers' Convention, at Syracuse, I had an opportunity to learn more about the osier, and rode out to Liverpool, only three miles distant from Syracuse. Every evidence of thrift and prosperity abounded. Great piles of green willows in bundles were lying on the roadside and in dooryards, cut before snowfall for winter work.

It is because of new processes for peeling the bark that winter is now made the active season for basket-making. A full load—say, one ton—is lifted off the wagon by a crane, and the rack containing the willow is lowered into a steam box, and in a very short time it is steamed sufficiently to peel readily. The peeling is done still by hand, but very rapidly. Once steamed, they will slip their bark any time, if not permitted to dry. Eighteen dollars per ton was paid by the basket-makers for green willows just cut, in the fall, and at that rate the crop pays very finely, for as high as ten tons per acre has been produced. A friend engaged in the business there, and who is well acquainted with Virginia, having visited us here and seen our osiers, says that we have rare advantages here, because we can cut all winter long, as we need the willows for work. He also says that great numbers of the German immigrants are basket makers, and that there will be no difficulty in getting as many as we want, when we have the willows.

The demand for willow-ware of all kinds is great, and it never ceases. A year ago extracts from the Georgia papers were freely published, giving most glowing accounts of the success of Mr. I. C. Plant, of Macon, Ga., and it was stated that he derived large profit from the bark of his osiers, used for the preparation of a valuable drug. Having supplied Mr. Plant four years ago, I wrote to him regarding the latter part of the story. His reply was that there would be profitable use for the bark whenever enough could be supplied and parties were ready to put up the machinery to use it, whenever they could be assured of 25 tons of bark.

The same advantage which is described as pertaining to Virginia must rule in California, where the willows may be cut as desired at any time in the winter. Of course the steaming need not be done on such a large scale as described, but a small steam box a foot square and eight or ten feet long can be made, and a small boiler rigged up to supply it with steam. How to do this can be learned by a visit to any local wagon-shop, where they have arrangements for steaming wood before bending. At a shop in which the writer worked, in Western New York, some years ago, the willow-growers brought their willow and had it steamed for a nominal price, and then drew it home again for peeling—keeping it from drying, and then it could be peeled at leisure. Of course it would be better to rig up a steamer at home, and any ingenious man can do that at small expense.

The preparation from willow bark, alluded to by the writer we have quoted above, is of course also possible here, if attention is given to develop it. Willow bark yields salicine, used to adulterate quinine, which is not very desirable, as our friends who need this drug should have it pure.

Osier willows are growing in different parts of the State. The largest plantation we have seen is on the Buhach ranch, near Atwater, Merced county, where the willows are planted along the irrigation ditches. Willows, of course, serve many purposes in farm economy; they may be used for tying vines, for thatching levee or ditch banks, and for many other uses. There should evidently be more of them grown in this State.

THE CLOTHILDE FAMILY OF HOLSTEIN-FRIESIAN CATTLE.

Immigration and the Labor Problem.

Reliable statistics inform us that from 1820 to 1885 over 13,000,000 of foreign-born persons reached the United States as immigrants. The lowest figure of any one year was 6354, in 1853; the highest was 788,992, in 1882.

Comparing the yearly arrivals, it is found that the greater number of arrivals invariably preceded the years of our greatest depression in business. The inference, very naturally, is that these excessive foreign accessions to our population have formed an important factor in our periods of business depression.

It is apparent to the most casual observer that the great bulk of the immigration concentrates in cities and towns which are recognized as leading industrial centers, and more especially in centers of mechanical industries. Comparatively few immigrants enter upon agricultural pursuits. The unskilled immigrants resort mainly to commercial cities, where there is a large demand for unskilled labor; the skilled immigrants gravitate to the mechanical shops wherever they may be found. The following figures, giving the number of foreign born persons, 10 years of age and over, who were engaged in agriculture, manufactories, etc., as per census of 1870 and 1880, furnish abundant proof of the above:

	1870.	1880.
Population 10 years of age and over	28,228,945	36,761,607
Foreign born 10 years of age and over	5,307,887	6,491,301
Foreign born engaged in agriculture	619,108	812,829
Foreign born engaged in manufactures and mining	929,581	1,225,787
Total foreign born engaged in agriculture, manufactures, etc.	1,548,689	2,038,616

A careful examination of these figures shows that our foreign-born population constituted but a fraction over 10 per cent of those engaged in agriculture, while the foreign element engaged in manufacturing, mechanical and mining industries represents 32 per cent of all persons so employed.

These are important facts for the consideration of our political economists. The trouble does not arise so much from the fact of a large immigration as from the manner in which that immigration is distributed; although another class of figures might be given, and, in fact, were given, in these columns some months ago, which tend to show that unpleasant complications may arise in the near future which, very likely, may call for some restrictive legislation in regard to immigration. Still, such legislation would be attended with difficulty, and would set at naught one of the cardinal principles upon which this Government was originally organized. It is doubtful if the people of this country will ever submit to fence in their territory with a Chinese wall, except it be to fence out people like the Chinese themselves who can never assimilate with our people or their institutions—civil, religious or social. A large portion of the very best blood in this country entered into American life by a voyage across the Atlantic. Notwithstanding the many difficulties in the way of keeping this country perpetually open, as a harbor of refuge and protection to the oppressed and suffering of all nations, we must devise some means to receive and distribute those who come to us in a way by which both the comer and the resident shall be mutually benefited. We cannot conclude this brief article better than by quoting the words of a cotemporary, as follows:

Addition to population rightly distributed and in proportion to its possibilities is the soul and sinew of our development. It has made us what we are in the sovereignty of a continent and in the nations of the world. To disrate the immigrant is to desecrate our fathers' graves and to insult the verdict of our history. The whole evil consequent to foreign immigration lies in its one-sided direction and its overgrown proportions, and the task of statesmanship is in the way of curtailing its magnitudes without profaning its rights. To encourage what is desirable of population in its kind and quantity is, and will be for years to come, a national duty and a reserve source of strength and progress, while a blind and indiscriminate permit of immigration will just as surely end in catastrophe and industrial calamity.

The Clothilde Family.

We are seldom able to favor our readers with so beautiful a picture of so celebrated a family of cattle. If royalty be a condition of superiority through merit, this family could most certainly be classed as royal, for as individuals and as a family they have by their records attained a position of prominence heretofore unknown in the dairy world.

Clothilde, the queen and mother of this family, gained for herself and her family distinction by producing 26,021 lbs. 2 ozs. of milk in one year, as a six-year old, and, not satisfied with this enormous yield, kept on giving milk until the record in 15 months and 13 days was increased to 30,590 lbs. 9 ozs. Her daughter, Clothilde 2d, strove hard to equal the mother and only fell short a little, her record being 23,602 lbs. 10 ozs. of milk in a year, as a four-year old, which places her at the head of all animals of her age. Another daughter, Clothilde 4th, although but two years old, nobly sustains the reputation of the family and breed by giving 14,021 lbs. 14 ozs. of milk in a year, and the trio—mother and two daughters—at an average age of 4 years, average 21,215 lbs. 3 ozs. each for a year, which record has never been approached by the same number of animals of one family. Clothilde 2d's Duchess, as a 2-year-old, gave 13,150 lbs. 9 ozs. in a year, a substantial proof "like begets like," that and that "breeding will tell." The butter-producers of these cows are of a high order, Clothilde having given 4 lbs. 13¼ ozs. of butter in two days, 21.28 lbs. of milk making 1 lb. of butter, which record is at the rate of 17 lbs. 3⅜ ozs. for a week. Clothilde 2d made 17 lbs. 12 ozs. of butter in a week. Clothilde 2d's Duchess made 12 lbs. of butter in a week, as a 2-year-old. These cows are seemingly in good company, as their owners, Messrs. Smiths, Powell & Lamb, of Syracuse, N. Y., state that their entire herd of mature cows the past season averaged 17,166 lbs. 1 oz. of milk each in a year. They also have 34 two-year-old heifers, which averaged 12,465 lbs. 7 ozs. of milk in a year, the entire number that finished their records during the year. Other records reported are as follows:

Twenty-five cows and heifers averaged 18,034 lbs. 9 9-25 ozs. of milk each in a year.

Nine cows and heifers averaged 20,231 lbs, 8 1-9 ozs. of milk each in a year.

Seventy-five cows and heifers averaged 17 lbs. each of butter in a week.

Thirty-seven cows and heifers averaged 20 lbs, 1 6-7 ozs, of butter each in a week.

Twelve cows and heifers averaged 23 lbs. 1-6 oz. of butter each in a week.

Sixteen three-year-old heifers averaged 16 lbs. of butter each in a week.

Twenty two-year-old heifers averaged 12 pounds 3½ ozs. of butter each in a week.

Such records should have interest to every person interested in dairy cattle, and especially so to any one intending to invest with the view of getting profitable returns from the butter and milk production of the cattle. This firm issue a catalogue giving records and pedigrees of their stock, which they mail to parties interested in Holstein-Friesian or other milch cattle on application.

A BOTANICAL phenomenon in which the people of Leominster, England, take pride is a pair of trees—an oak and an ash—which appear to have but a single trunk. They grow together for about four feet and then divide.

THE IRRIGATOR.

Wright's Irrigation Bill.

The importance of the bill concerning irrigation, introduced by Hon. C. C. Wright, and passed at the last session of the Legislature, seems to require us to give the full text of the measure, which we do below:

An Act to Provide for the Organization and Government of Irrigation Districts, and to Provide for the Acquisition of Water and Other Property, and for the Distribution of Water thereby for Irrigation Purposes. Approved March 7, 1887.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Whenever fifty or a majority of freeholders owning lands susceptible of one mode of irrigation from a common source, and by the same system of works, desire to provide for the irrigation of the same, they may propose the organization of an irrigation district under the provisions of this Act, and when so organized such district shall have the powers conferred or that may hereafter be conferred by law upon such irrigation districts.

SEC. 2. A petition shall first be presented to the Board of Supervisors of the county in which the lands or the greatest portion thereof is situated, signed by the required number of freeholders of such proposed district, which petition shall set forth and particularly describe the proposed boundaries of such district, and shall pray that the same may be organized under the provisions of this Act. The petitioners must accompany the petition with a good and sufficient bond, to be approved by the said Board of Supervisors, in double the amount of the probable cost of organizing such district, conditioned that the bondsmen will pay all said cost in case said organization shall not be effected. Such petition shall be presented at a regular meeting of the said Board, and shall be published for at least two weeks before the time at which the same is to be presented, in some newspaper printed and published in the county where said petition is presented, together with a notice stating the time of the meeting at which the same will be presented. When such petition is presented, the said Board of Supervisors shall hear the same, and may adjourn such hearing from time to time, not exceeding four weeks in all; and on the final hearing may make such changes in the proposed boundaries as they may find to be proper, and shall establish and define such boundaries; *provided*, that said Board shall not modify said boundaries so as to except from the operation of this Act any territory within the boundaries of the district proposed by said petitioners, which is susceptible of irrigation by the same system of works applicable to the other lands in such proposed district, nor shall any lands which will not, in the judgment of the said Board, be benefited by irrigation by said system be included within such district; *provided*, that any person whose lands are susceptible of irrigation from the same source shall, upon application of the owner to said Board, be entitled to have such lands included in said district. Said Board shall also make an order dividing said district into five divisions, as nearly equal in size as may be practicable, which shall be numbered, First, Second, Third, Fourth and Fifth, and one Director shall be elected from each district. Said Board of Supervisors shall then give notice of an election to be held in such proposed district, for the purpose of determining whether or not the same shall be organized under the provisions of this Act. Such notice shall describe boundaries so established, and shall designate a name for such proposed district, and said notice shall be published for at least three weeks prior to such election in a newspaper published within said county; and if any portion of such proposed district lie within another county or counties, then said notice shall be published in a newspaper published within each of said counties. Such notice shall require the electors to cast ballots which shall contain the words, "Irrigation District—Yes;" or, "Irrigation District—No," or words equivalent thereto; and also the names of persons to be voted for to fill the various elective offices hereinafter prescribed. No person shall be entitled to vote at any election held under the provisions of this Act unless he shall possess all the qualifications required of electors under the general election laws of this State.

SEC. 3. Such election shall be conducted in accordance with the general election laws of the State, provided that no particular form of ballot shall be required. The said Board of Supervisors shall meet on the second Monday next succeeding such election, and proceed to canvass the votes cast thereat; and if upon such canvass it appear that at least two-thirds of all the votes cast are "Irrigation District—Yes," the said Board shall, by an order entered on their minutes, declare such territory duly organized as an irrigation district, under the name and style theretofore designated, and shall declare the persons receiving, respectively, the highest number of votes for such several offices to be duly elected to such offices. Said Board shall cause a copy of such order, duly certified, to be immediately filed for record in the office of the County Recorder of each county in which any portion of such lands are situated, and must also immediately forward a copy thereof to the Clerk of the Board of Supervisors of each of the counties in which any portion of the district may lie; and no Board of Supervisors of any county, including any portion of such district, shall, after the date of the organization of such district, allow another district to be formed, including any of the lands in such district, without the consent of the Board of Directors thereof; and from and after the date of such filing, the organization of such district shall be complete, and the officers thereof shall be entitled to enter immediately upon the duties of their respective offices, upon qualifying in accordance with law, and shall hold such offices, respectively, until their successors are elected and qualified. For the purposes of the election above provided for, the said Board of Supervisors must establish a convenient number of election precincts in said proposed district, and define the boundaries thereof, which said precincts may thereafter be changed by the Board of Directors of such district.

SEC. 4. An election shall be held in such district on the first Wednesday in April, eighteen hundred and eighty-eight, and on the first Wednesday in April in each second year thereafter, at which an Assessor, a Collector, and a Treasurer and a Board of five Directors for the district shall be elected. The person receiving the highest number of votes for any office to be filled at such election, is elected thereto. Within ten days after receiving their certificates of election, hereinafter provided for, said officers shall take and subscribe the official oath and file the same in the office of the Board of Directors. The Assessor shall execute an official bond in the sum of ten thousand dollars, and the Collector an official bond in the sum of twenty thousand dollars, and the district Treasurer an official bond in the sum of fifty thousand dollars; each of said bonds to be approved by the Board of Directors; and each member of said Board of Directors shall execute an official bond in the sum of twenty five thousand dollars, which said bonds shall be approved by the Judge of the Superior Court of said county where such organization was effected, and shall be recorded in the office of the County Recorder thereof, and filed with the Secretary of said Board. All official bonds herein provided for shall be in the form prescribed by law for the official bonds of county officers.

SEC. 5. Fifteen days before any election held under this Act, subsequent to the organization of any district, the Secretary of the Board of Directors shall cause notices to be posted in three public places in each election precinct, of the time and place of holding the election, and shall also post a general notice of the same in the office of said Board, which shall be established and kept at some fixed place to be determined by said Board, specifying the polling places of each precinct. Prior to the time for posting the notices, the Board must appoint for each precinct, from the electors thereof, one Inspector and two Judges, who shall constitute a Board of Election for such precinct. If the Board fail to appoint a Board of Election, or the members appointed do not attend at the opening of the polls on the morning of election, the electors of the precinct present at that hour may appoint the Board, or supply the place of an absent member thereof. The Board of Directors must, in its order appointing the Board of Election, designate the house or place within the precinct where the election must be held.

SEC. 6. The Inspector is Chairman of the Election Board, and may:

First—Administer all oaths required in the progress of an election.

Second—Appoint Judges and Clerks if, during the progress of the election, any Judge or Clerk cease to act. Any member of the Board of Election, or any Clerk thereof, may administer and certify oaths required to be administered during the progress of an election. The Board of Election for each precinct must, before opening the polls, appoint two persons to act as Clerks of the election. Before opening the polls, each member of the Board and each Clerk must take and subscribe an oath to faithfully perform the duties imposed upon them by law. Any elector of the precinct may administer and certify such oath. The polls must be opened one hour after sunrise on the morning of the election, and be kept open until sunset, when the same must be closed. The provisions of the Political Code concerning the form of ballots to be used shall not apply to elections held under this Act.

SEC. 7. Voting may commence as soon as the polls are opened, and may be continued during all the time the polls remain opened, and shall be conducted as nearly as practicable in accordance with the provisions of chapter nine of title two of part three of the Political Code of this State. As soon as the polls are closed, the Judges shall open the ballot-box and commence counting the votes; and in no case shall the ballot-box be removed from the room in which the election is held until all the ballots have been counted. The counting of ballots shall in all cases be public. The ballots shall be taken out, one by one, by the Inspector or one of the Judges, who shall open them and read aloud the names of each person contained therein, and the office for which every such person is voted for. Each Clerk shall write down each office to be filled, and the name of each person voted for for such office, and shall keep the number of votes by tallies, as they are read aloud by the Inspector or Judge. The counting of votes shall be continued without adjournment until all have been counted.

SEC. 8. As soon as all the votes are read off and counted, a certificate shall be drawn up on each of the papers containing the poll list and tallies, or attached thereto, stating the number of votes each one voted for has received, and designating the office to fill which he was voted for, which number shall be written in figures and in words at full length. Each certificate shall be signed by the Clerk, Judge and the Inspector. One of said certificates, with the poll list and the tally paper to which it is attached, shall be retained by the Inspector and preserved by him at least six months. The ballots shall be strung upon a cord or thread by the Inspector, during the counting thereof, in the order in which they are entered upon the tally list by the Clerks; and said ballots, together with the other of said certificates, with the poll list and tally paper to which it is attached, shall be sealed by the Inspector in the presence of the Judges and Clerks, and indorsed "Election Returns of (naming the precinct) Precinct," and be directed to the Secretary of the Board of Directors, and shall be immediately delivered by the Inspector, or by some other safe and responsible carrier designated by said Inspector, to said Secretary, and the ballots shall be kept unopened for at least six months; and if any person be of the opinion that the vote of any precinct has not been correctly counted, he may appear on the day appointed for the Board of Directors to open and canvass the returns, and demand a recount of the vote of the precinct that is so claimed to have been incorrectly counted.

SEC. 9. No list, tally paper, or certificate returned from any election, shall be set aside or rejected for want of form, if it can be satisfactorily understood. The Board of Directors must meet at its usual place of meeting on the first Monday after each election to canvass the returns. If, at the time of meeting, the returns from each precinct in the district in which the polls were opened have been received, the Board of Directors must then and there proceed to canvass the returns, but if all the returns have not been received, the canvass must be postponed from day to day until all the returns have been received, or until six postponements have been had. The canvass must be made in public and by opening the returns and estimating the vote of the district for each person voted for, and declaring the result thereof.

SEC. 10. The Secretary of the Board of Directors must, as soon as the result is declared, enter in the records of such Board, a statement of such result, which statement must show:

First—The whole number of votes cast in the district.

Second—The names of the persons voted for.

Third—The office to fill which each person was voted for.

Fourth—The number of votes given in each precinct to each of such persons.

Fifth—The number of votes given in the district to each of such persons.

The Board of Directors must declare elected the person having the highest number of votes given for each office to be filled by the votes of the district. The Secretary must immediately make out and deliver to such person a certificate of election signed by him and authenticated with the seal of the Board. In case of a vacancy in the office of Assessor, Tax Collector, or Treasurer, the vacancy shall be filled by appointment by the Board of Directors. In case of a vacancy in the office of member of the Board of Directors, the vacancy shall be filled by appointment by the Board of Supervisors of the county where the office of such Board is situated. An officer appointed as above provided shall hold his office until the next regular election for said district, and until his successor is elected and qualified.

SEC. 11. On the first Wednesday in May next following their election the Board of Directors shall meet and organize as a Board, elect a President from their number, and appoint a Secretary. The Board shall have the power, and it shall be their duty, to manage and conduct the business and affairs of the district, make and execute all necessary contracts, employ and appoint such agents, officers, and employes as may be required, and prescribe their duties, establish equitable by-laws, rules, and regulations for the distribution and use of water among the owners of said lands, and generally to perform all such acts as shall be necessary to fully carry out the purposes of this Act. The said by-laws, rules, and regulations must be printed in convenient form for distribution in the district. And it is hereby expressly provided that all waters distributed for irrigation purposes shall be apportioned ratably to each land-owner upon the basis of the ratio which the last assessment of such owner for district purposes within said district bears to the whole sum assessed upon the district; *provided*, that any land-owner may assign the right to the whole or any portion of the waters so apportioned to him.

SEC. 12. The Board of Directors shall hold a regular monthly meeting, in their office, on the first Tuesday in every month, and such special meetings as may be required for the proper transaction of business; *provided*, that all special meetings must be ordered by a majority of the Board; the order must be entered of record, and five days' notice thereof must, by the Secretary, be given to each member not joining in the order. The order must specify the business to be transacted, and none other than that specified must be transacted at such special meeting. All meetings of the Board must be public, and three members shall constitute a quorum for the transaction of business; but on all questions requiring a vote, there shall be a concurrence of at least three members of said Board. All records of the Board shall be open to the inspection of any elector during business hours. The Board, and its agents and employes, shall have the right to enter upon any land in the district to make surveys, and may locate the line for any canal or canals, and the necessary branches for the same, on any of said lands which may be deemed best for such location. Said Board shall also have the right to acquire, either by purchase or condemnation, all lands and waters, and other property necessary for the construction, use, supply, maintenance, repair, and improvement of said canal or canals and works, including canals and works constructed and being constructed by private owners, lands for reservoirs, for the storage of needful waters, and all necessary appurtenances. In case of purchase, the bonds of the district, hereinafter provided for, may be used at their par value in payment; and in case of condemnation, the Board shall proceed, in the name of the district, under the provisions of title seven, of part three, of the Code of Civil Procedure. Said Board may also construct the necessary dams, reservoirs, and works for the collection of water for said district, and do any and every lawful act necessary to be done, that sufficient water may be furnished to each land-owner in said district for irrigation purposes. The use of all water required for the irrigation of the lands of any district formed under the provisions of this Act, together with the rights of way for canals and ditches, sites for reservoirs, and all other property required in fully carrying out the provisions of this Act, is hereby declared to be a public use, subject to the regulation and control of the State, in the manner prescribed by law.

SEC. 13. The legal title to all property acquired under the provisions of this Act shall immediately and by operation of law vest in such irrigation district, and shall be held by such district in trust for and is hereby dedicated and set apart to the uses and purposes set forth in this Act. And said Board is hereby authorized and empowered to hold, use, acquire, manage, occupy, and possess said property as herein provided.

SEC. 14. The said Board is hereby authorized and empowered to take conveyances or other assurances for all property acquired by it under the provisions of this Act, in the name of such irrigation district, to and for the uses and purposes herein expressed, and to institute and maintain any and all actions and proceedings, suits at law or in equity, necessary or proper in order to fully carry out the provisions of this Act, or to enforce, maintain, protect, or preserve any and all rights, privileges, and immunities created by this Act or acquired in pursuance thereof. And in all Courts, actions, suits, or proceedings, the said Board may sue, appear, and defend, in person or by attorneys, and in the name of such irrigation district.

SEC. 15. For the purpose of constructing necessary irrigating canals and works and acquiring the necessary property and rights therefor, and otherwise carying out the provisions of this Act, the Board of Directors of any such district must, as soon after such district has been organized as may be practicable, estimate and determine the amount of money necessary to be raised, and shall immediately thereupon call a special election, at which shall be submitted to the electors of such district possessing the qualifications prescribed by this Act, the question whether or not the bonds of said district shall be issued in the amount so determined. Notice of such election must be given by posting notices in three public places in each election precinct in said district for at least twenty days, and also by publication of such notice in some newspaper published in the county, where the office of the Board of Directors of such district is required to be kept, once a week for at least three successive weeks. Such notices must specify the time of holding the election, the amount of bonds proposed to be issued, and said election must be held and the result thereof determined and declared, in all respects as nearly as practicable, in conformity with the provisions of this Act governing the election of officers; *provided*, that no informalities in conducting such an election shall invalidate the same, if the election shall have been otherwise fairly conducted. At such election the ballots shall contain the words, "Bonds—Yes," or "Bonds—No," or words equivalent thereto. If a majority of the votes cast are "Bonds—Yes," the Board of Directors shall immediately cause bonds in said amount to be issued; said bonds shall be payable in gold coin of the United States, in installments as follows, to wit: At the expiration of eleven years not less than five per cent of said bonds; at the expiration of twelve years not less than six per cent; at the expiration of thirteen years not less than seven per cent; at the expiration of fourteen years not less than eight per cent; at the expiration of fifteen years not less than nine per cent; at the expiration of sixteen years not less than ten per cent; at the expiration of seventeen years not less than eleven per cent; at the expiration of eighteen years not less than thirteen per cent; at the expiration of nineteen

(*Continued on page 272.*)

19 REASONS WHY THE "GLIDDEN" LEADS ALL OTHERS:

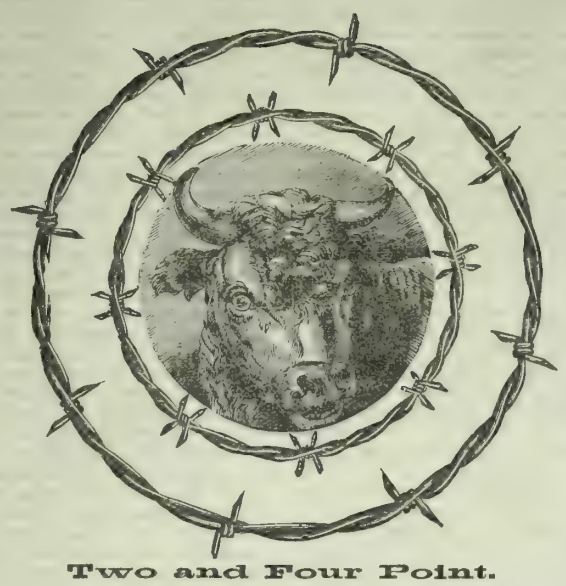
BECAUSE being made from new ingot steel wire, it is **20** to **50** per cent stronger than others made from "merchant" or scrap steel wire, and

BECAUSE being composed of one-half to full size larger main wires, its strength is increased **200** to **400** pounds breaking strain.

BECAUSE the Galvanized wire is treated by the English process, which instead of burning the wire, as the acid processes do, ACTUALLY INCREASES ITS STRENGTH. We guarantee it to be **300** to **600** pounds stronger than acid galvanized wire.

BECAUSE the Glidden is **one** to **four** ounces per rod **lighter** than any other barb fencing composed of equal size main wires, for reason of its LIGHTER BARB.

BECAUSE it has the **greatest number of barbs** per rod, hence gives **better protection.** It has in the "Thick Set" style **20** to **40** more barbs than other wires.



BECAUSE though it has **more** barbs, they weigh **less**, requiring as they do 20 to 50 inches less material to make them.

BECAUSE owing to its **lighter weight per rod**, it will cost for 100 rods of fence, **$1.00** to **$3.00** less than other styles at same price per pound.

BECAUSE it has the **shortest, sharpest, lightest, strongest and most effective** BARB.

BECAUSE its barbs cannot be removed or displaced.

BECAUSE it holds its tension better than any other, as barbs do not bind main wires together, thus interfering with contraction and expansion.

Two and Four Point.

BECAUSE it is more **evenly twisted**, thus giving **full strength of both wires.**

BECAUSE it is twisted just enough to give it spring and elasticity, and not enough to overcome those qualities or to make it unnecessarily heavy.

BECAUSE main wires bind the **barb**, instead of **barb binding main wires**, thus giving spring and elasticity the WHOLE LENGTH OF THE LINE, instead of BETWEEN THE BARBS. It is universally admitted that the Glidden REMAINS TAUT through varying temperatures better than any other.

BECAUSE it has most **weight and strength** in main wires where needed, and **least weight** in barbs.

BECAUSE all the barbs are at right angles to the line, and each standing alone makes **every** point effective.

BECAUSE 100 pounds of Glidden makes as many rods of fence as 130 of other styles, where the same size main wire is used.

BECAUSE a guarantee of quality goes with every pound sold, and the manufacturers stand ready to make it good.

BECAUSE it is the most **perfectly made** on most **approved machinery**, and most rigidly inspected.

BECAUSE, in a word, it is universally admitted to be the **BEST.**

More farmers use the Glidden than all others combined. More railroad companies use it than all others combined. It is better known and better liked than any other. It is the STANDARD OF THE WORLD, and where its merits are known, readily commands **$1.00** per 100 pounds more than any other wire in the market. The manufacturers have never yielded, in the sharpest competition, to the temptation of decreasing the size of the wire, nor the quality of the wire itself.

Wright's Irrigation Bill.

(*Continued from page 270.*)

years not less than fifteen per cent; and for the twentieth year a percentage sufficient to pay off said bonds; and shall bear interest at the rate of six per cent per annum, payable semi-annually on the first day of January and July of each year. The principal and interest shall be payable at the office of the Treasurer of the district. Said bonds shall be each of the denomination of not less than one hundred dollars, or more than five hundred dollars, shall be negotiable in form, signed by the President and Secretary, and the seal of the Board of Directors shall be affixed thereto. They shall be numbered consecutively as issued, and bear date at the time of their issue. Coupons for the interest shall be attached to each bond signed by the Secretary. Said bonds shall express on their face that they were issued by authority of this Act, stating its title and date of approval. The Secretary shall keep a record of the bonds sold, their number, the date of sale, the price received and the name of the purchaser.

SEC. 16. The Board may sell said bonds from time to time, in such quantities as may be necessary and most advantageous, to raise money for the construction of said canals and works, the acquisition of said property and rights, and otherwise to fully carry out the objects and purposes of this Act. Before making any sale the Board shall, at a meeting, by resolution, declare its intention to sell a specified amount of the bonds, and the day and hour and place of such sale, and shall cause such resolution to be entered in the minutes, and notice of the sale to be given, by publication thereof at least twenty days, in a daily newspaper published in each of the Cities of San Francisco, Sacramento and Los Angeles, and in any other newspaper, at their discretion. The notice shall state that sealed proposals will be received by the Board, at their office, for the purchase of the bonds, till the day and hour named in the resolution. At the time appointed the Board shall open the proposals, and award the purchase of the bonds to the highest responsible bidder, and may reject all bids; but said Board shall in no event sell any of the said bonds for less than ninety per cent of the face value thereof.

SEC. 17. Said bonds, and the interest thereon, shall be paid by revenue derived from an annual assessment upon the real property of the district; and all the real property in the district shall be, and remain, liable to be assessed for such payments as hereinafter provided.

SEC. 18. The Assessor must, between the first Monday in March and the first Monday in June, in each year, assess all real property in the district, to the persons who own, claim, have the possession or control thereof, at its full cash value. He must prepare an assessment-book, with appropriate headings, in which must be listed all such property within the district, in which must be specified, in separate columns, under the appropriate head:

First—The name of the person to whom the property is assessed. If the name is not known to the Assessor, the property shall be assessed to "Unknown Owners."

Second—Land by township, range, section, or fractional section, and when such land is not a congressional division or subdivision, by metes and bounds, or other description sufficient to identify it, giving an estimate of the number of acres, locality, and the improvements thereon.

Third—City and town lots, naming the city or town, and the number and block according to the system of numbering in such city or town, and the improvements thereon.

Fourth—The cash value of real estate, other than city or town lots.

Fifth—The cash value of improvements on such real estate.

Sixth—The cash value of city and town lots.

Seventh—The cash value of improvements on city and town lots.

Eighth—The cash value of improvements on real estate assessed to persons other than the owners of the real estate.

Ninth—The total value of all property assessed.

Tenth—The total value of all property after equalization by the Board of Directors.

Eleventh—Such other things as the Board of Directors may require.

SEC. 19. The Board of Directors must allow the Assessor as many deputies, to be appointed by him, as will, in the judgment of the Board, enable him to complete the assessment within the time herein prescribed. The Board must fix the compensation of such deputies, which shall be paid out of the treasury of the district. The compensation must not exceed five dollars per day for each deputy, for the time actually engaged, nor must any allowance be made but for work done between the first Monday in March and the first Monday in August in each year.

SEC. 20. On or before the first Monday in August in each year the Assessor must complete his assessment-book, and deliver it to the Secretary of the Board, who must immediately give notice thereof, and of the time the Board of Directors, acting as a Board of Equalization, will meet to equalize assessments, by publication in a newspaper published in each of the counties comprising the district. The time fixed for the meeting shall not be less than twenty nor more than thirty days from the first publication of the notice; and in the meantime the assessment-book must remain in the office of the Secretary for the inspection of all persons interested.

SEC. 21. Upon the day specified in the notice required by the preceding section for the meeting, the Board of Directors, which is hereby constituted a Board of Equalization for that purpose, shall meet and continue in session from day to day, as long as may be necessary, not to exceed ten days, exclusive of Sundays, to hear and determine such objections to the valuation and assessment as may come before them; and the Board may change the valuation as may be just. The Secretary of the Board shall be present during its sessions, and note all changes made in the valuation of property, and in the names of the persons whose property is assessed; and within ten days after the close of the session he shall have the total values, as finally equalized by the Board, extended into columns and added.

SEC. 22. The Board of Directors shall then levy an assessment sufficient to raise the annual interest on the outstanding bonds; and at the expiration of ten years after the issuing of bonds by the Board, must increase said assessment, for the ensuing ten years, in the following percentage of the principal of the whole amount of bonds then outstanding, to wit: For the eleventh year, five per cent; for the twelfth year, six per cent; for the thirteenth year, seven per cent; for the fourteenth year, eight per cent; for the fifteenth year, nine per cent; for the sixteenth year, ten per cent; for the seventeenth year, eleven per cent; for the eighteenth year, thirteen per cent; for the nineteenth year, fifteen per cent; and for the twentieth year, a percentage sufficient to pay off said bonds. The Secretary of the Board must compute and enter in a separate column of the assessment-book the respective sums in dollars and cents to be paid as an assessment on the property therein enumerated. When collected the assessment shall be paid into the district treasury, and shall constitute a special fund to be called the "Bond Fund of (naming the district) Irrigation District."

SEC. 23. The assessment upon real property is a lien against the property assessed, from and after the first Monday in March for any year; and such lien is not removed until the assessments are paid or the property sold for the payment thereof.

SEC. 24. On or before the first day of November, the Secretary must deliver the assessment-book to the Collector of the district, who shall, within twenty days, publish a notice in a newpaper published in each of the counties comprising the district, if there be lands situated in more than one county in such district, that said assessments are due and payable and become delinquent at six o'clock P. M. on the last Monday of December next thereafter; and that unless paid prior thereto, five per cent will be added to the amount thereof, and also the time and place at which payment of assessments may be made. The notice shall also specify a time and place within each election precinct of the district, when and where the Collector will attend to receive payment of assessments, and shall be published for fifteen days, and a printed copy of said notice shall be posted for the same time in some public place in each precinct. The Collector must attend at the time and place specified in the notice, to receive assessments, which must be paid in gold and silver coin; he must mark the date of payment of any assessment in the assessment-book opposite the name of the person paying, and give a receipt to such person, specifying the amount of the assessment and the amount paid, with a description of the property assessed. On the thirty-first day of December of each year, all unpaid assessments are delinquent, and thereafter the Collector must collect thereon, for the use of the district, an addition of five per cent.

SEC. 25. On or before the first day of February, the Collector must publish the delinquent list, which must contain the nathes of the persons and a description of the property delinquent, and the amount of the assessments and costs due opposite each name and description. He must append to and publish with the delinquent list a notice that, unless the assessments delinquent, together with costs and percentage, are paid, the real property upon which such assessments are a lien will be sold at public auction. The publication must be made once a week for three successive weeks in a newspaper published in each of the counties comprised in the district. The publication must designate the time and place of sale. The time of sale must not be less than twenty-one nor more than twenty-eight days from the first publication, and the place must be at some point designated by the Collector.

SEC. 26. The Collector must collect, in addition to the assessments due on the delinquent list and five per cent added, fifty cents on each lot, piece or tract of land separately assessed, one half of which must go to the district and the other to the Collector for preparing the list. On the day fixed for the sale, or some subsequent day to which he may have postponed it, of which he must give notice, the Collector, between the hours of ten o'clock A. M. and three o'clock P. M., must commence the sale of the property advertised, commencing at the head of the list and continuing alphabetically, or in the numerical order of the lots or blocks, until completed. He may postpone the day of commencing the sales, or the sale from day to day, but the sale must be completed within three weeks from the day first fixed.

SEC. 27. The owner or person in possession of any real estate offered for sale for assessments due thereon may designate in writing to the Collector, prior to the sale, what portion of the property he wishes sold, if less than the whole; but if the owner or possessor does not, then the Collector may designate it, and the person who will take the least quantity of the land, or in case an undivided interest is assessed, then the smallest portion of the interest, and pay the assessments and costs due, including two dollars to the Collector for the duplicate certificate of sale, is the purchaser. If the purchaser does not pay the assessments and costs before ten o'clock A. M. the following day, the property on next sale day, before the regular sale, must be resold for the assessments and costs. After receiving the amount of assessments and costs, the Collector must make out in duplicate a certificate dated on the day of sale, stating (when known) the name of the person assessed, a description of the land sold, the amount paid therefor, that it was sold for assessments, giving the amount and the year of the assessment, and specifying the time when the purchaser will be entitled to a deed. The certificate must be signed by the Collector, and one copy delivered to the purchaser, and the other filed in the office of the County Recorder of the county in which the land sold is situated.

SEC. 28. The Collector, before delivering any certificate, must in a book enter a description of the land sold, corresponding with the description in the certificate, the date of the sale, purchasers' names, and amount paid, regularly number the description on the margin of the book and put a corresponding number on each certificate. Such book must be open to public inspection, without fee, during office hours, when not in actual use. On filing the certificate with such County Recorder the lien of the assessments vests in the purchaser, and is only divested by the payment to him, or to the Collector for his use, of the purchase-money and two per cent per month from the day of sale until redemption.

SEC. 29. A redemption of the property sold may be made by the owner, or any party in interest, within twelve months from the date of purchase. Redemption must be made in gold or silver coin, as provided for the collection of State and county taxes, and when made to the Collector he must credit the amount paid to the person named in the certificate, and pay it, on demand, to the person or his assignees. In each report the Collector makes to the Board of Directors, he must name the persons entitled to redemption money, and the amount due to each. On receiving the certificate of sale, the County Recorder must file it and make an entry in a book similar to that required of the Collector. On the presentation of the receipt of the person named in the certificate, or of the Collector, for his use, of the total amount of the redemption money, the Recorder must mark the word "Redeemed," the date, and by whom redeemed, on the certificate and on the margin of the book where the entry of the certificate is made. If the property is not redeemed within twelve months from the sale, the Collector, or his successor in office, must make to the purchaser, or his assignee, a deed of the property, reciting in the deed substantially the matters contained in the certificate, and that no person redeemed the property during the time allowed by law for its redemption. The Collector shall receive from the purchaser, for the use of the district, two dollars for making such deed.

SEC. 30. The matter recited in the certificate of sale must be recited in the deed, and such deed duly acknowledged or proved is prima facie evidence that:

First—The property was assessed as required by law.

Second—The property was equalized as required by law.

Third—That the assessments were levied in accordance with law.

Fourth—The assessments were not paid.

Fifth—At a proper time and place the property was sold as prescribed by law, and by the proper officer.

Sixth—The property was not redeemed.

Seventh—The person who executed the deed was the proper officer.

Such deed duly acknowledged or proved is (except as against actual fraud) conclusive evidence of the regularity of all the proceedings from the assessment by the Assessor, inclusive, up to the execution of the deed. The deed conveys to the grantee the absolute title to the lands described therein free of all incumbrances, except when the land is owned by the United States or this State, in which case it is prima facie evidence of the right of possession.

SEC. 31. The assessment-book or delinquent list, or a copy thereof, certified by the Collector, showing unpaid assessments against any person or property, is prima facie evidence of the assessment, the property assessed, the delinquency, the amount of assessments due and unpaid, and that all the forms of the law in relation to the assessment and levy of such assessments have been complied with.

SEC. 32. When land is sold for assessments correctly imposed, as the property of a particular person, no misnomer of the owner or supposed owner, or other mistake relating to the ownership thereof, affects the sale or renders it void or voidable.

SEC. 33. On the first Monday in each month the Collector must settle with the Secretary of the Board for all moneys collected for assessments, and pay the same over to the Treasurer; and within six days thereafter he must deliver to and file in the office of the Secretary a statement under oath, showing:

First—An account of all his transactions and receipts since his last settlement.

Second—That all money collected by him as Collector has been paid.

The Collector shall also file in the office of the Secretary on said first Monday in each month, the receipt of the Treasurer for the money so paid.

SEC. 34. Upon the presentation of the coupons due to the Treasurer, he shall pay the same from said Bond Fund. Whenever after ten years from the issuance of said bonds, said fund shall amount to the sum of ten thousand dollars, the Board of Directors may direct the Treasurer to pay such an amount of said bonds not due as the money in said fund will redeem, at the lowest value at which they may be offered for liquidation, after advertising for at least four weeks in some daily newspaper in each of the cities hereinbefore named, and in any other newspaper which said Board may deem advisable, for sealed proposals for the redemption of said bonds. Said proposals shall be opened by the Board in open meeting, at a time to be named in the notice, and the lowest bid for said bonds must be accepted; *provided*, that no bond shall be redeemed at a rate above par. In case the bids are equal, the lowest-numbered bond shall have the preference. In case none of the holders of said bonds shall desire to have the same redeemed, as herein provided for, said money shall be invested by the Treasurer, under the direction of the Board, in United States gold-bearing bonds, or the bonds of the State, which shall be kept in said "Bond Fund," and may be used to redeem said dis rict bonds whenever the holders thereof may desire.

SEC. 35. After adopting a plan of said canal or canals, storage, reservoirs, and works, the Board of Directors shall give notice, by publication thereof not less than twenty days in one newspaper published in each of the counties composing the district, provided a newspaper is published therein, and in such other newspapers as they may deem advisable, calling for bids for the construction of said work, or of any portion thereof; if less than the whole work is advertised, then the portion so advertised must be particularly described in such notice; said notice shall set forth that plans and specifications can be seen at the office of the Board, and that the Board will receive sealed proposals therefor, and that the contract will be let to the lowest responsible bidder, stating the time and place for opening said proposals, which at the time and place appointed shall be opened in public, and as soon as convenient thereafter the Board shall let said work, either in portions or as a whole, to the lowest responsible bidder, or they may reject any or all bids and readvertise for proposals, or may proceed to construct the work under their own superintendence with the labor of the residents of the district. Contracts for the purchase of the material shall be awarded to the lowest responsible bidder. Any person or persons to whom a contract may be awarded shall enter into a bond, with good and sufficient sureties, to be approved by the Board, payable to said district for its use, for double the amount of the contract price, conditioned for the faithful performance of said contract. The work shall be done under the direction and to the satisfaction of the Engineer, and be approved by the Board.

SEC. 36. No claim shall be paid by the Treasurer until allowed by the Board, and only upon a warrant signed by the President and countersigned by the Secretary; *provided*, that the Board may draw from time to time from the Construction Fund and deposit it in the County Treasury of the county where the office of the Board is situated, any sum in excess of the sum of twenty-five thousand dollars. The County Treasurer of said county is hereby authorized and required to receive and receipt for the same, and place the same to the credit of said district, and he shall be responsible upon his official bond for the safekeeping and disbursement of the same, as in this Act provided. He shall pay out the same, or any portion thereof, to the Treasurer of the district only, and only upon the order of the Board, signed by the President and attested by the Secretary. The said County Treasurer shall report in writing, on the second Monday in each month, the amount of money in the County Treasury, the amount of receipts for the month preceding, and the amount or amounts paid out; said report shall be verified and filed with the Secretary of the Board. The District Treasurer shall also report to the Board, in writing, on the first Monday in each month, the amount of money in the District Treasury, the amount of receipts for the month preceding, and the amount and items of expenditures, and said report shall be verified and filed with the Secretary of the Board.

SEC. 37. The cost and expense of purchasing and acquiring property, and constructing the works and improvements herein provided for, shall be wholly paid out of the Construction Fund. For the purpose of defraying the expenses of the organization of the district, and of the care, operation, management, repair and improvement of such portions of said canal and works as are completed and in use, including salaries of officers and employes, the Board may either fix rates of tolls and charges, and collect the same from all persons using said canal for irrigation and other purposes, or they may provide for the payment of said expenditures by a levy of assessments therefor, or by both said tolls and assessments; if by the latter method, such levy shall be made on the completion and equalization of the assessment roll,

and the Board shall have the same powers and functions for the purposes of said levy as are now possessed by Boards of Supervisors in this State. The procedure for the collection of assessments by such levy shall in all respects conform to the provisions of this Act relating to the payment of principal and interest of bonds herein provided for.

SEC. 38. The Board of Directors shall have power to construct said works across any stream of water, water-course, street, avenue, highway, railway, canal, ditch or flume which the route of said canal or canals may intersect or cross, in such manner as to afford security for life and property; but said Board shall restore the same, when so crossed or intersected, to its former state as near as may be, or in a sufficient manner not to have impaired unnecessarily its usefulness; and every company whose railroad shall be intersected or crossed by said works, shall unite with said Board in forming said intersections and crossings, and grant the privileges aforesaid; and if such railroad company and such Board, or the owners and controllers of the said property, thing, or franchise so to be crossed, cannot agree upon the amount to be paid therefor, or the points or the manner of said crossings or intersections, the same shall be ascertained and determined in all respects as is herein provided in respect to the taking of land. The right of way is hereby given, dedicated, and set apart to locate, construct, and maintain said works over and through any of the lands which are now, or may be, the property of this State; and also there is given, dedicated, and set apart, for the uses and purposes aforesaid, all waters and water rights belonging to this State within the district.

SEC. 39. The Board of Directors shall each receive four dollars per day, and mileage at the rate of twenty cents per mile, in attending meetings, and actual and necessary expenses paid while engaged in official business under the order of the Board. The Board shall fix the compensation to be paid to the other officers named in the Act, to be paid out of the Treasury of the district; *provided*, that said Board shall, upon the petition of at least fifty, or a majority of the freeholders within such district therefor, submit to the electors at any general election a schedule of salaries and fees to be paid hereunder. Such petition must be presented to the Board twenty days prior to a general election, and the result of such election shall be determined and declared in all respects as other elections are determined and declared under this Act.

SEC. 40. No Director or any other officer named in this Act shall in any manner be interested, directly or indirectly, in any contract awarded or to be awarded by the Board, or in the profits to be derived therefrom; and for any violation of this provision, such officer shall be deemed guilty of a misdemeanor, and such conviction shall work a forfeiture of his office, and he shall be punished by a fine not exceeding five hundred dollars, or by imprisonment in the county jail not exceeding six months, or by both such fine and imprisonment.

SEC. 41. The Board of Directors may, at any time, when in their judgment it may be advisable, call a special election, and submit to the qualified electors of the district, the question, whether or not a special assessment shall be levied for the purpose of raising money to be applied to any of the purposes provided in this Act. Such election must be called upon the notice prescribed, and the same shall be held, and the result thereof determined and declared in all respects in conformity with the provisions of section fifteen of this Act. The notice must specify the amount of money proposed to raise, and the purpose for which it is intended to be used. At such elections the ballots shall contain the words, "Assessment—Yes," or "Assessment—No." If two-thirds or more of the votes cast are "Assessment—Yes," the Board shall, at the time of the annual levy hereunder, levy an assessment sufficient to raise the amount voted. The rate of assessment shall be ascertained by deducting fifteen per cent for anticipated delinquencies from the aggregate assessed value of the property in the district, as it appears on the assessment roll for the current year, and then dividing the sum voted by the remainder of such aggregate assessed value. The assessments so levied shall be computed and entered on the assessment roll by the Secretary of the Board, and collected at the same time and in the same manner as other assessments provided for herein; and when collected shall be paid into the District Treasury for the purposes specified in the notice of such special election.

SEC. 42. The Board of Directors, or other officers of the district, shall have no power to incur any debt or liability whatever, either by issuing bonds, or otherwise, in excess of the express provisions of this Act; and any debt or liability incurred, in excess of such express provisions, shall be and remain absolutely void.

SEC. 43. In case the volume of water in any stream or river shall not be sufficient to supply the continual wants of the entire country through which it passes, and susceptible of irrigation therefrom, then it shall be the duty of the Water Commissioners, constituted as hereinafter provided, to apportion, in a just and equitable proportion, a certain amount of said water upon certain or alternate weekly days to different localities, as they may, in their judgment, think best for the interest of all parties concerned, and with due regard to the legal and equitable rights of all. Said Water Commissioners shall consist of the Chairman of the Board of Directors of each of the districts affected.

SEC. 44. It shall be the duty of the Board of Directors to keep the water flowing through the ditches under their control to the full capacity of such ditches in times of high water.

SEC. 45. Navigation shall never in anywise be impaired by the operation of this Act, nor shall any vested interest in or to any mining water rights or ditches, or in or to any water or water rights, or reservoirs or dams, now used by the owners or possessors thereof, in connection with any mining industry, or by persons purchasing or renting the use thereof, or in or to any other property now used directly or indirectly in carrying on or promoting the mining industry, ever be affected by or taken under its provisions, save and except that rights of way may be acquired over the same.

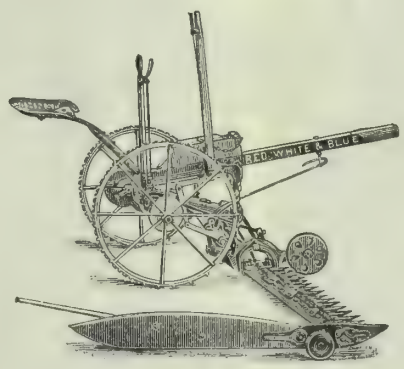
SEC. 46. None of the provisions of this Act shall be construed as repealing or in anywise modifying the provisions of any other Act relating to the subject of irrigation or Water Commissioners. Nothing herein contained shall be deemed to authorize any person or persons to divert the waters of any river, creek, stream, canal or ditch, from its channel, to the detriment of any person or persons having any interest in such river, creek, stream, canal or ditch, or the waters therein, unless previous compensation be ascertained and paid therefor, under the laws of this State authorizing the taking of private property for public uses.

SEC. 47. This Act shall take effect immediately.

A Lucky Man.

"A lucky man is rarer than a white crow," says Juvenal, and we think he knew. However, we have heard of thousands of lucky ones and we propose to let their secret out. They were people broken down in health, suffering with liver, blood and skin diseases, scrofula, dropsy, and consumption, and were lucky enough to hear of and wise enough to use Dr. Pierce's "Golden Medical Discovery," the sovereign blood purifier, tonic and alterative of the age.

A Bonanza Mine



Of health is to be found in Dr. R. V. Pierce's "Favorite Prescription," to the merits of which as a remedy for female weakness and kindred affections thousands testify.

* * * * Decline of man or woman, prematurely induced by excesses or bad practices, speedily and radically cured. Book (illustrated), 10 cents in stamps. Consultation free World's Dispensary Medical Association, Buffalo, N. Y.

NOTICE.

THE ANNUAL MEETING OF THE STOCKHOLDERS OF THE GRANGERS' BUSINESS ASSOCIATION, a corporation, for the election of a Board of Directors for the ensuing year, and for the transaction of such other business as may properly come before it, will be held at the office of the corporation, 108 Davis Street, San Francisco, at 10 o'clock A. M., Wednesday, April 13, 1887.

CHAS. WOOD, Sec'y. DANIEL INMAN, Pres't.

We want every farmer interested in the cutting of grass for hay to aid us in the introduction of the RED, WHITE and BLUE MOWER, because after thorough, practical tests in the toughest cutting to be found in California, these points have been demonstrated beyond question:

1. It is the best built Mower, and therefore the strongest and most durable.

2. It will work successfully in the most difficult cutting. It cannot be clogged or choked.

3. Though the strongest and best cutting machine, it is not a horse-killer. From comparative tests it is found to be the lightest running machine in the large family of Mowers.

Any rancher contemplating the purchase of a Mower for the coming harvest, will do well to inform us, that we may submit for his consideration our proposition on the RED, WHITE and BLUE.

JAPANESE IMPORTATIONS.

The senior partner of the firm of H. H. BERGER & CO. leave early in April for Japan, to visit their nurseries, as well as native establishments, taking notes on all matters of importance to the horticultural and agricultural interests of the United States. We shall pay particular attention to the introduction of choice novelties, valuable fruit, timber, shade and ornamental trees, as well as desirable vegetable and other seeds, making the relative merits of Japanese fruits, the various sorts of which differ widely in quality, a particular study. Having been in the business for nine years, we consider our standing and reliability well established.

Parties wishing personal attention and careful selection of stock, as well as early delivery in fall, of fruit or ornamental trees, lily bulbs, chestnut, pear and other seeds, ready for shipment by that time, will please send orders to our usual address, from where letters will be forwarded to Yokohama.

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. 20,000 acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION, 401 California St., San Francisco.

The Latest Fashions.

Ladies' Costume.

FIG. 1.—The materials here combined are velvet and wool suiting. The skirt is fashioned in the round four-gored style, and is plainly finished at the edge. The front gore is covered by a panel that is its counterpart in shape, and on either side gore is a kilted panel reaching more than half-way to the belt, the plaits being very wide and numbering three that turn forward, the front plaits overlapping the front panel. Overhanging the top of the kilted panel is a plain panel that is deeply reversed on the outside at the bottom; a facing of velvet covers the reversed portion, and three large oxidized buttons placed over long, simulated buttonholes appear to hold the edge in place. The result is unique and remarkably pretty. The back drapery falls to the edge of the skirt, and is very simply arranged in two bournous loops at the top, the loops being seamed and deftly caught to the skirt. Gathers adjust the top of the drapery and complete the draping. A most simple but handsome effect is developed in the basque, which shapes a point at the end of the closing, and is deepened back of the first darts to fall square at either side of the point. Buttons and buttonholes close it down the center, and some distance from the closing on either side of the front is applied a band of velvet that is curved in quite narrow at the waist-line and widened toward the shoulders and also toward the lower edge of the deeper part of the front. A jaunty vest effect is thus achieved, and two large buttons arranged upon large simulated buttonholes are placed on the deeper part of the front just back of the bands. Double bust darts, under-arm and side-back gores and a curving center seam adjust the basque superbly, and all the seams are continued in their graceful curves to the lower edge. The standing collar is of velvet, and deep cuffs that flare at the upper side are simulated with velvet and afford a handsome finish for the coat sleeves. Frequently the center-front panel will be of contrasting material to correspond with either of the panels on the sides. All kinds of dress goods of the new spring and also of the standard varieties will be made up into costumes of this description, and a wide field is left for some unique and pretty developments with material and decoration. Velvet may be fashionably used with all kinds of dress goods. It is obtainable in all shades at reasonable prices, what is called silk velvet being rarely used except for very choice dresses. The hat is trimmed with striped silk and a bird, and its brim is smoothly faced with velvet.

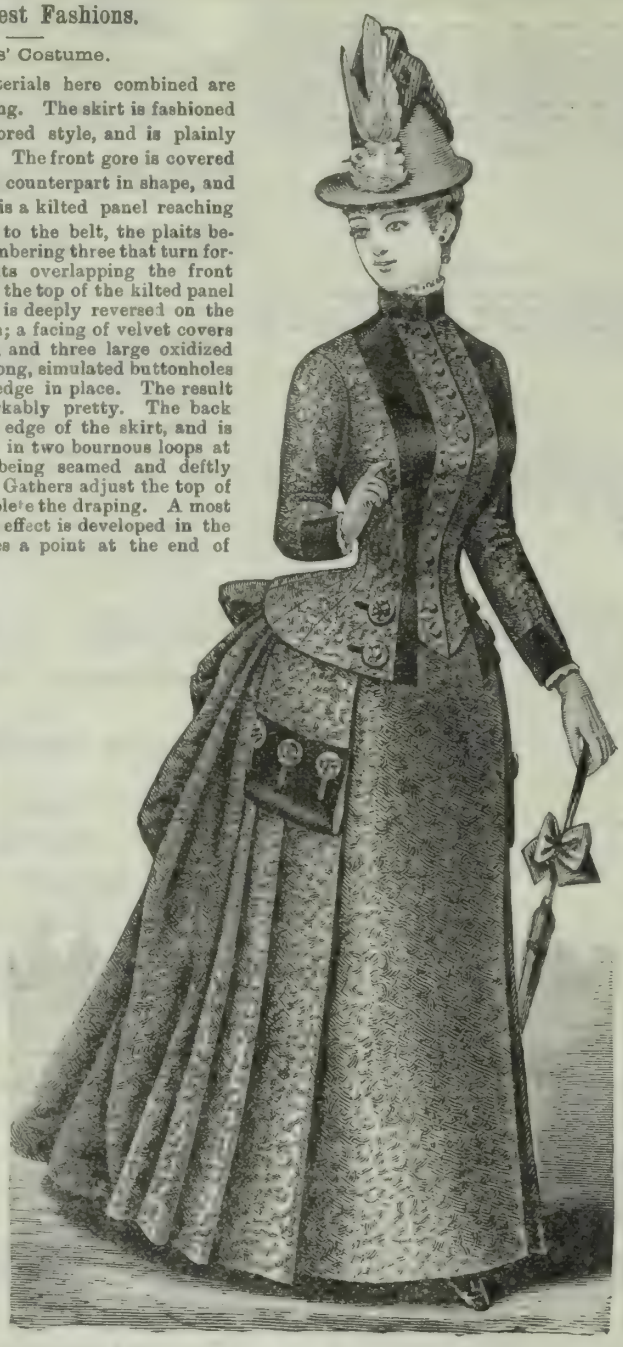

Fig. 1.—LADIES' COSTUME.

Fig. 3.—LADIES' HAT.

Fig. 2.—GIRL ' COSTUME.

Girls' Costume.

FIG. 2.—The costume is here shown developed in garnet-colored cloth and surah, with velvet for the cuffs. The fronts are arranged to close down one side from a little in front of the shoulders, and on the wider or overlapping front is arranged a pompadour puff that is shirred at the neck and lower edge, the latter coming at the bust. Across the lower edge of the puff are straps of braid that have their pointed ends lapped under buttons at the center; and below these the front is crossed by straps similarly arranged, the lowest strap coming over the seam joining the skirt to the body. Jacket fronts are arranged upon these fronts and are wide apart at their front edges, to which are joined lapels that gradually narrow toward the lower end, and are quite broad at the top. Three short straps of braid decorate the upper part of the lapels, their back ends being pointed and ornamented with a button. Side-back gores and a curving center seam make the adjustment graceful and clinging at the back and sides. The skirt is laid in pretty kilt plaits and is hemmed at the lower edge. A unique-looking sash drapery consisting of three parts is arranged at the back. One part is folded over in a *revers* at one edge and arranged in a loop and long end; a shorter section is plaited to form a very short end that flares in fan fashion, and a longer end that falls a little below the loop; and these two parts are caught together at their plaits under a plaited cross-piece. The coller is in the round, flat style and extends no further forward than the lapels. The cuffs are formed of two parts that lap at the under and upper sides of the wrists, and are pretty completions to well-fitting coat sleeves. A plaited piece is arranged upon the front below the puff in the original garment and is provided in the pattern, but in this instance it is omitted to show that it is not really needful. All varieties of dress goods devoted to the costumes of little women may be stylishly fashioned by the mode, and the lapels, collar and cuffs may be edged with beads or drop ornaments, decorated with braid or overlaid with lace or embroidery. Plain and plaid or striped fabrics combine well in this way. The hat is trimed with surah, and the brim is smoothly faced with velvet.

Ladies' Hat.

FIG. 3.—Dark-brown straw of a coarse grade forms this hat. It is quite large, and with its high crown and rolling brim will be becoming to all but small women, who would look extinguished under it. A band of brown velvet is about the crown, and slightly to one side is a cluster of ribbon loops, the ribbon being velvet and in two colors—green and brown. Three brown tips are arranged to droop over these loops, and an amber ornament is fastened in front. A strap of the ribbon extends over the brim on the trimmed side, apparently holding it in place.

THE FARMERS' FRIEND 3-PLOW GANG
Is a light, but strongly built gang, of 3, 9 or 10-inch bottoms; can be easily handled around hills or vines, and runs close to trees without barking them. Why use single plows in the orchard or vineyard, each requiring a man and one or two horses, when the FARMERS' FRIEND will do the work of 3 *single plows* and with *only one man and two horses?* Large numbers of these plows are in use here in California, and we refer to over 100 prominent fruit-growers who are using them.

THE TIGER MOWER!

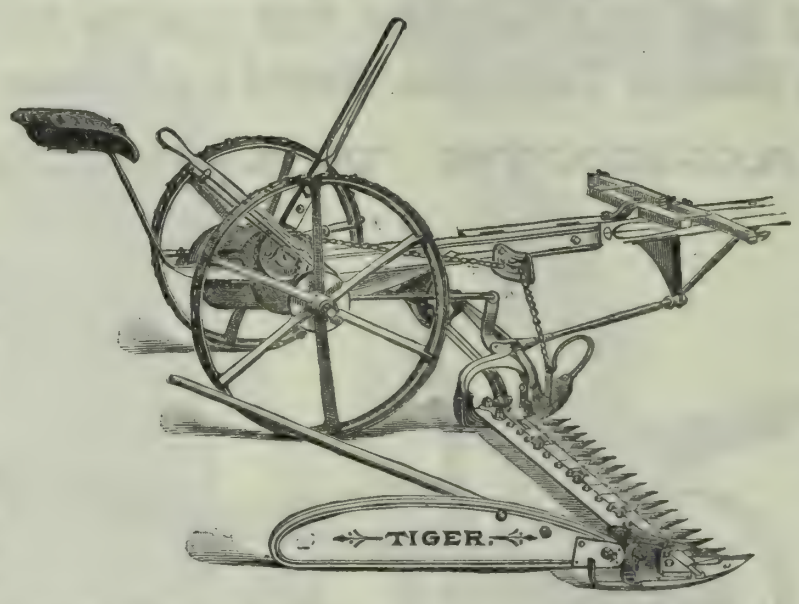
A Few of the Many Testimonials

FROM PARTIES WHO USED THE

TIGER MOWER

IN 1886:

CLOVERDALE, CAL., March 11, 1887.



MESSRS. BAKER & HAMILTON, San Francisco, Cal.:

Gents: The Tiger Mower bought of your agent, Mr. G. Cameron, after a thorough trial in the presence of quite a number of my neighbors, gave entire satisfaction. I consider it the best Mower that I have seen work. DAVID HALL.

LIVERMORE, CAL., June 15, 1886.

MESSRS. BAKER & HAMILTON, San Francisco, Cal.:

I purchased nine Tiger Mowers this season through your agents, The Farmers' Union. I cut about 1400 acres of land with them—much of it very heavy clover. I consider it the lightest draft Mower I have ever used, and works well wherever you put it. The construction being so simple commends it to all farmers. GEO. C. STANLEY.

Cuts 4 feet 3 inches. Price, $80.00

THE TIGER

IS THE

Best Mower Ever Offered,

AND THE MACHINE TO BUY.

LOMPOC, Sept. 10, 1886.

MESSRS. BAKER & HAMILTON, San Francisco, Cal.:

I bought last season of your agent, Mr. Rudolph, a Tiger Mower. I have tried the Buckeye, McCormick, and several other kinds of Mowers, and am better pleased with the Tiger than any of them. For all kinds of cutting I would recommend it as the best Mower in the Market. Yours truly,

THOMAS ROBINSON.

ALTAMONT, June 1, 1886.

MESSRS. BAKER & HAMILTON, San Francisco, Cal.:

The Tiger Mower I bought of your agents, Farmers' Union, Livermore, has given me the best satisfaction of any Mower I have ever had. I have worked it on steep side hills and in heavy clover. I will cheerfully recommend it as the best Mower for all kinds of cutting that has ever come to this coast. Yours truly, ALBERT BARTHOLD.

This machine has all the good points and none of the defects of the most perfect front-cut and rear-cut Mowers.

It has a number of most valuable improvements possessed by no other machine.

It is not only a front-cut Mower, but has an absolutely free floating cutter-bar, which is *drawn, and in no sense pushed* forward when at work.

The shoe or guards will not catch in an abrupt dead furrow, because they are automatically tilted up at the points when they drop into a depression, and are *drawn upward out* of the furrows, and not *pushed downward into* the furrow, as in other front-cut Mowers.

It will do the best of work in all kinds of cutting under the most trying circumstances.

The wheels are the proper distance apart to make them always run in the swath tracks when the machine is at work.

Both horses walk in the swath tracks and therefore do not trample upon either the cut or the uncut grass.

The fender under pole with wrought-iron brace connecting to inside shoe takes off all side draft; the team draws direct on cutting bar, thereby it has no lost motion in heavy cutting.

The inside horse has more space to walk in than with any other Mower, which permits the Mower to cut full width either on level or hilly land.

While both the team and wheels are tracking perfectly, the machine cuts the full length of the bar.

FARMS FOR SALE!

—BY—

GRIFFIN BROTHERS,

Cottonwood, Shasta County, California.

TITLES ALL GOOD OR NO SALE.

We have 40 inches of rain annually, hence need no irrigation and have no law-suits about water rights. Plenty of wood and water. Good schools, good society, cheap land, the best of soils, and local markets for all products. No snow, no blizzards, no black gnats, no damage from north winds, no chills and fever.

No. 49.

$3000 —A well improved 160 acres, 10 miles west of this town on Cottonwood Creek. On public road. New dwelling, only 10 rods to school house; no hills. Forty acres cleared; some good bottom land. U. S. title. Terms cash. Crop goes in.

A FINE RURAL HOME. No. 67.

$25,000.—1085 acres 2 miles from Cottonwood, and fronts on a never-failing stream. About 500 acres of the finest quality of dark, deep, alluvial land that will produce corn, alfalfa, wheat, vegetables or crops of any kind; has yielded 7000 bushels of wheat in one season, besides other crops. The balance of the farm is rolling woods-pasture. On the bottom land are two orchards and vineyard, 3 dwelling houses, large barns and granaries that would cost $5000. Several good wells of water. Splendid location for healthfulness and picturesque scenery. All the farming machinery and household furniture; 19 good horses, including a young stallion; 19 head of cattle, mostly cows; and 40 hogs; also sufficient hay and grain to seed the farm goes in with the farm. Part may remain against the farm if purchaser so desires.

No. 68. A SUBURBAN HOME.

$7200.—240 acres on Cottonwood Creek, 2 miles from town; all well fenced and cross-fenced; all good land under cultivation; one half is first-class bottom land; good buildings; terms, half cash.

No. 71.

$3000 —800 acres rolling land, finest kind of pasture. Wells can be had for stock water.

No. 70.

$10 per acre—160 acres, perfectly level, gray, second bottom land; 40 acres clear; balance has some brush and oak, but easily cleared. One of the very best locations in Cottonwood valley for Fruits of any kind without irrigation. Terms cash.

No. 73.

Four sections of the best stock pasture land. Rolling hills all covered with grass, on which cattle graze and do well the year round. Plenty of water for stock. This place will be sold very cheap if application is made soon. Title perfect.

No. 74.

$10 per acre.—120 acres good vine land, nearly all cleared, none too rough for work, good house and everlasting spring. U. S. patent. Terms cash.

No. 75.

$10 per acre.—700 east of and on the Sacramento river. All under a good, new wire fence. A never-failing creek crosses the land and furnishes abundance of stock water the year round. About 300 acres level, of which 80 are the finest kind of river bottom land. This bottom land has been under cultivation for several years and produces excellent vegetables.

☞Call on or address

GRIFFIN BROTHERS,
Cottonwood Valley, Shasta Co., Cal.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canals and entitle the owner to one-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

☞For further particulars call on or address

359,405.—HOISTING-JACK—D. B. Scott, S. F.
359,365.—GARMENT SUPPORTER—R. H. Sink, Grass Valley, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

PERCHERON STALLIONS—WHY FARMERS BUY THEM.—During these hard times, when nearly every farm product is so low in price that it hardly seems worth raising, we see many of our most intelligent and progressive farmers, who have not hitherto been interested in horse breeding, buying finely bred high-priced Percheron stallions. This to many is a source of astonishment, but is the result of observation that large, well-formed, active horses always have been, and necessarily must continue to be, in active demand at large prices on account of the scarcity in the United States of suitable stallions for their production, all such having to be imported. The yearly increasing demand for such stallions is the best evidence that such investments are profitable. And to this fact is due the development of large importing and breeding establishments, notably among which and largely exceeding all others is that of Mr. M. W. Dunham's Oaklawn Farm, at Wayne, Illinois.

Important to All

Who are willing to work for the reward of success. Hallett & Co., Portland Maine, will mail you, free, full particulars about work that either sex, young or old, can do, at a profit of from $5 to $25 per day, and upwards, and live at home, wherever they are located. All can do the work. Capital not required; Hallett & Co. will start you. Grand success absolutely sure. Write at once and see.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

TO THOSE WHO CONTEMPLATE TAKING UP THE BOOK BUSINESS, we wish to say that we are prepared to do better by them than any other house can afford. We carry the finest line of popular subscription books on this Coast, and by a system of training, can make a success of the most inexperienced. Book Agents, we ask you to look into this. Address for terms, books, and territory, BANCROFT & CO., 607 Market St., San Francisco.

Cheap Money for Farmers.

Farmers in this State will be glad to learn that they can borrow on mortgage any amount, from $5000 to $500,000, from S. D. Hovey, 330 Pine St., San Francisco, at 6 to 7 per cent and taxes. .**

Try It

The Le Roi des Savon—the king of soaps—is undoubtedly the most remarkable labor-saving soap ever made. Try it faithfully, and according to the directions upon the wrapper.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, promote a useful enterprise, and, at the same time, earn a good, honest living. Apply to Dewey & Co., 220 Market St., S. F.

P. S. Readers of this notice can help our common cause by informing persons, likely to become good agents, of this chance.

Liberal Religious Literature.

Views, Opinions, and Sentiments of Eminent Writers on Religion and its Relation to Man and Society. Address MISS HARRIET KELSEY, Sec'y, Unitarian Church, San Francisco. Correspondence invited.

Money Loaned

On Country Real Estate in large and small amounts, at lowest rates, by A. Schuller, 106 Leidesdorff St., room 3. **

Will sell

AT PUBLIC AUCTION

About March 22d (for date see later advertisement) **the balance of the Paso Robles Ranch,** consisting of town lots in Templeton, 800 acres in 5 to 12-acre lots adjoining Templeton, and 14,000 acres in ranch subdivisions;

ALSO,

2100 acres of the **Huer Huero Ranch** in 20 subdivisions.

These are all agricultural and fruit lands, in quality equal to any in the State, with an average annual rainfall exceeding that of Santa Clara county, and require

NO IRRIGATION.

Title, U. S. Patent and to be free and clear of all incumbrances.

TERMS OF SALE.

Lots in Templeton, cash, U. S. Gold Coin. All other tracts one-third cash; balance in 4 equal payments, at 2, 3, 4 and 5 years; interest 6 per cent per annum. The mortgage tax paid by the mortgagee makes the interest about 4 per cent net to the purchaser.

An additional charge will be made of $5, for deed in sale of town lots, and $25 in other cases for expenses of sale, including making and recording all papers.

Schedule price of ranch subdivisions average $20 an acre; of 5 to 12-acre lots, $50 an acre.

SALE WITHOUT RESERVE,

Providing that no bid will be entertained at less than 60 per cent of schedule prices.

Ten per cent of cash payment (but in no case less than $100) required at fall of hammer; 30 days to complete sale. Parties failing for 30 days, forfeit sum paid.

Parties going from Los Angeles take P. C. S. S. Co.'s Steamers from San Pedro to San Luis Obispo. From San Francisco, take 8:30 A. M. daily train, S. P. R. R., to Templeton.

Parties wishing to inspect said lands with a view to purchasing at the Auction, or any of the Company's Land at private sale, will be shown the property free of charge by applying at the Company's office in Templeton.

Maps of all the ranch subdivisions, of Templeton, of the 5 to 12-acre suburban lots, and a general map showing the location of the Company's lands with a new descriptive catalogue are in press and will be sent free on application after the 25th inst. (February, 1887.)

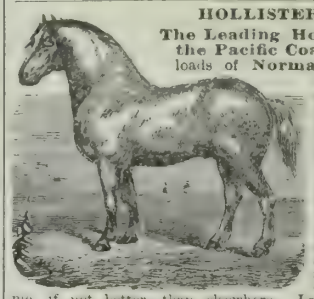
NEW IMPORTATION
—OF—
NORMAN STALLIONS.



Theodore Skillman has just arrived from France with the choicest importation of Norman Stallions that has ever reached the Pacific Coast. Mr. Skillman has selected these horses from the best in France, with a view to the improvement of draft horses on this Coast. They are young and sure to suit the tastes of intending purchasers as regards color, etc., a number being coal-black. He has also on hand some Imported French Coach Stallions. These horses are now very popular in the East and have long been the favorite carriage horses of France. Their merits speak for themselves. Come and inspect this rare collection of horses and be convinced that they are the best ever seen on this Coast.

☞ Catalogue for 1887 sent free on application.

THEODORE SKILLMAN,
Petaluma, Cal.

HOLLISTER CALA.

The Leading Horse Farm of the Pacific Coast. Three carloads of **Norman-Percheron** Thoroughbreds, all ages, both sexes, just received from M. W. Dunham's Great Nursery, Wayne, Du Page Co., Ill. Graded stock also on sale. Large assortment to select from. Any horses sold by me are guaranteed as represented. You can do as well with me, if not better, than elsewhere. Largest and best. Weight as high as 2200 pounds. Some of my horses are on exhibition at Knickerbocker Stables, San Jose.

E. J. TURNER, Hollister, Cal.

HOLSTEIN-FRIESIANS!

Our Herd, **100 HEAD!** All ages and both sexes. Beyond question one of the finest in the world! S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, March 23, 1887.

The past week has shown continued activity in all lines of produce, with free shipments of such articles to the East as will be affected by the higher freight tariffs that will go into effect on April 5 next. Wheat has ruled quite strong in Europe, particularly for white wheat, such as harvested on this coast. The English market closed yesterday as follows:

LONDON, March 23, 1887.—Cargoes off coast, quiet but steady; on passage and for shipment, red wheat dull but white firmly held; Mark Lane, quiet; Cal. wheat, off coast, 37s 9d; just shipped, 39s 6d; nearly due, 38s; French country market, firm; Liverpool wheat, spot, rather easier; Liverpool wheat, Cal., 7s 6½d to 7s 9½d.' Weather in England, showery.

Foreign Review.

LONDON, March 21.—The *Mark Lane Express*, in its weekly review of the British grain trade, says The English wheat market is dull and irregular. Sales of English wheat during the past week were 418,965 quarters, at 32s 11d, against 72,519 quarters, at 30s 1d, during the corresponding week of last year. Anxiety is caused by discovery of large quantities of the pupæ of the Hessian fly in the screenings of wheat coming from the thrashing machines throughout the provinces. The *Agriculturist* urges the immediate destruction by fire of all screenings, claiming that if there is any delay it will be too late to cope with the pest. Flour is dull and weaker, owing to the enormous supplies from America. Foreign wheat does not improve. Indian and Russian are cheaper. Liverpool quotation is 1d lower. Corn is steady and prices are against buyers. Linseed fell 1s, but regained 6d toward the close of the week. There were three arrivals of wheat cargoes; two were withdrawn and one was sold. At to-day's market wheat was dull. Some sales were 6d under last Monday, for both English and foreign. Country flour was unchanged. Foreign flour was 6d lower, barley was 3d cheaper and sound oats were unchanged, but inferior were 6d lower. Linseed recovered 3d.

LONDON, March 21.—There is to be an option market in London at last, and the rules have been printed. As drawn they do not allow the sale of Californians (Liverpool delivery), but dealers in this contract are of opinion it will have to come to that.

Crops at the East.

CHICAGO, March 20.—The following crop summary will appear in the *Farmers' Review* this week: Reports from crop correspondents in 25 counties in Illinois this week are of a uniformly favorable tenor in reference to winter wheat. The condition of wheat throughout the State at the present time is up to the full average of the condition for the past five years. The tenor of Indiana reports continues favorable. Injury is reported from Ashtabula county, O., but the reports from 17 other counties in that State are all favorable. The wheat outlook in Missouri is more favorable than at any time during the three preceding years. The general situation in Kansas is slightly improved. Injury is reported in Genesee and Wayne counties, Michigan, and the crop in the lowlands throughout Southern Michigan exhibits damage, but the crop looks well in the uplands. Wisconsin reports are favorable.

Eastern Wheat Markets.

NEW YORK, March 19.—Wheat ruled irregular and unsettled throughout the week, with fairly active trading, both spot and options closing steady; spot, ¼@1c lower for the week, and options ⅛@¼c higher on near months, and ⅛c lower on August and September, as follows: March, 91¼ cents, April, 91¾; May, 92⅜; June, 91¾; July, 90⅝; August, 90⅜; September, 91.

NEW YORK, March 23.—92¾c for cash; 91¼c for March; 91¼c for April; 91⅝@91¾c for May.

CHICAGO, March 23.—75¾c for cash; 76c for April; 81⅛@81¼c for May.

Eastern Wool Markets.

BOSTON, March 19.—Wool market dull, and transactions of week small, amounting to 1,773,100 lbs of all kinds. Sales include 22,000 lbs medium Montana at 21@26c; 2500 lbs medium Montana, 25c; 8000 lbs medium Utah, 25c; 20,000 lbs medium Montana, 22c; 25,000 lbs choice Colorado, 22c; 30,000 lbs fine Montana, 21c; 45,000 lbs fine, 27@28c; 10,000 lbs medium and three-eighths, 20@20½c; 10,000 lbs Colorado, and 60,000 lbs fine medium on private terms. There has been more doing in fall Texas wool, mostly at low prices. Oregon wools are in fair demand, with sales of 25,000 lbs choice No. 1 valley at 28@29; 30,000 lbs No. 2, do, 25@26c; 100,000 lbs fine Eastern scoured, 60c; and 2500 lbs Eastern at private terms. California wool is dull and nominal. There have been sales of only 2000 lbs fall on private terms. Receipts of the week were 4315 bales domestic and 1657 bales foreign.

NEW YORK, March 19.—There has not been much business through the week. Manufacturers have been buying more to cover special wants. The feeling as to prices on desirable lots is quite steady, but prices on some undergrades favor buyers. Lower and medium fleeces and super pulled wools are the best material maintained, while Territorial wools are considerably demoralized. Among sales were 5000 lbs California spring at 16 cents; 15,000 lbs California fall at 12 cents; 30,000 lbs of unwashed Western at 33c; 45,000 lbs Territory at 18½@21c; 100,000 lbs fall and spring Texas at 20@22c.

While the Philadelphia market was dull during the week, a better feeling prevailed at the close. Holders continue to stand out against further concessions. Among sales were 20,000 lbs Oregon fine at 28½c; 30,700 lbs Territory medium at 20@22½c; 1000 lbs Territory fall at 17c; 2000 lbs scoured Territory at 57½c; 7000 lbs Montana fine at 27c.

New York Hop Market.

NEW YORK, March 19.—Brewers are still very indifferent buyers, and dealers are doing nothing that way except when a positive bargain may be picked up. Some small lots of fine quality Pacific are occasionally sold at 20@22c, and choice Bavarian brings as much as 22@24c in one or two bale lots; but transactions in 1886 hops, of any kind, at over 17@18c, are rare. Coast crop, 1885, good to prime, 8@10 cents.

Dried and Canned Fruit at the East.

NEW YORK, March 19.—Canned Goods—There is a quiet market for all descriptions. Peas are lower, though supplies are said to be quite small. Tomatoes are dull at $1.07½@1.10. Fruits are of slow sale. California canned peaches $2.50@2.70; pears $2.50@3.25; plums $1.75@2; grapes $1.75@2; apricots $2.10@2.50.

Dried Fruits—For raisins, owing to strong competition, lower prices prevail. California, two-crown loose Muscatel, quoted at $1.20; do three-crown, $1.40; California Londons, $1.50@1.70. Prunes, Turkish, are selling at 4⅛@4¾c; French, quiet, at 7@7¼c. Currants, easier at 4¾c. Citron, quiet at 17¼c.

California Fruit in Chicago.

CHICAGO, March 21.—Oranges—Receipts of oranges from California have increased considerably this week, and the quality of the fruit arriving here is much improved. About 30 per cent of the oranges on the market here are from California and are in good demand at prices a little firmer for choice and easier for poor stock than those ruling last week. Of very choice fruit there is only a moderate supply, the bulk being of the cheaper grade. Seedlings are quoted, $2.50@3.25; Navels, $2@6, and bloods, $5.

Dried Fruits—Rather quiet. Choice bright qualities meet with a moderate demand, but common dark lots are not moving off very well. Sliced apples, scarce; evaporated are also firm, owing to light supplies. Good qualities at medium prices can also be sold. Peaches are not much better than nominal. The supply is small and consists mainly of old, which are pretty good in quality, but meet with a limited demand. California dried fruits are, as a rule, held steadily, but no large transactions are heard of. Prunes, French, ₩ lb, 8@9¼c; Prunes, pitted, 8@9¼c; Plums, pitted, 10@10½c; Peaches, halves, 11@11½c; do, halves, pared, 20@21c; Figs, 6@8c; Nectarines, 9c; Pears, 8@8½c; Raisins, London layers, 20-lb boxes, ₩ box, $1.40@1.50; loose Muscatel, ₩ box, $1.20@1.30; California layers, ₩ box, $1.25@1.35.

California Products at New York.

NEW YORK, March 20.—Seeds quiet. California yellow mustard, 3¾@4c.

Local Markets.

BAGS—The market for Calcutta standard sizes closed weak at lower prices, owing to buyers being offish and sellers more urgent. Spot sales are reported at 5⅞ to 6 cts; and for June-July delivery at 6⅛ to 6¼ cts.

BARLEY—The market, under a strong and active demand to meet Call Board sales, moved up to $1.06¼ for good feed, but since then it has sold lower, with an easy tone at the close. Stocks, it is claimed, are being concentrated. The consumption is increasing. On Call, transactions have been free; buyer season sold up to $1.08½ per ctl. The market closed weak. Sales on Call yesterday were as follows:

Morning Session: Buyer season—200 tons, $1.06¼; 100, $1.05¾; 200, $1.05; 1000, $1.04½; 500, $1.04⅜; 100, $1.04⅝; 100, $1.04⅞; 300, $1.04¾. Buyer 1887—200 tons, $1.06¼. Seller season—100 tons, $1.01½. May—100 tons, $1.02 ₩ ctl.

BUTTER—There is a strong bear pressure, owing, it is said, to dealers desiring to buy cheaper so as to pack consignments as low as possible. The stock of fresh in rolls is quite heavy.

CHEESE—The market appears to be steadier, under a larger consumptive demand. It is claimed that with free receipts prices will shade off, but with lighter receipts a higher range is looked for.

EGGS—Heavy receipts of Eastern have depressed the poorer qualities, but strictly choice being in lighter supply, sell at an advance.

FLOUR—The market closed strong at an advance of 10 cts per bbl; another advance is looked for soon.

WHEAT—The market has ruled very strong throughout the week, and at a higher range of values. The buying came chiefly from the short sellers on Call, who sold buyer season options and bought the actual wheat so as to make the delivery. Transactions on Call the past week were large and at attractive fluctuations, but at a gradual advance. The recorded sales made yesterday were as follows:

Morning Session: Buyer season—100 tons, $1.71; 1300, $1.70¾; 100, $1.70⅝; 2100, $1.70½; 500, $1.70⅜; 400.$1.70¼; 1000, $1.70. Buyer 1887—100 tons, $1.75; 100, $1.75½; 100, $1.75¼; 100, $1.75¾. Seller 1887—600 tons, $1.56¼; 200, $1.56⅜; 100, $1.56¾; 100, $1.56⅞; 400, $1.57. May—900 tons, $1.68; 1300, $1.68¼. June—100 tons, $1.69½. July—100 tons, $1 69; 300, $1.68¼; 300, $1.68. September—200 tons, $1.63⅞ ₩ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

The exports of wheat from the United States, from July 1, 1886, to March 1, aggregated 108,170,000 bushels. Taking this and adding to it the quantity 335,000,000 bushels required for food, seed and manufactures, gives a total of 443,170,000 bushels of this season's crop provided for. As the crop was 457,218,000 bushels, it only leaves 14,048,000 bushels of this season's crop for export from March 1 to July 1 next. But to this must be added the carryover, 75,000,000 bushels, from the season of 1885-86, which gives a surplus of 89,000,000 bushels. Say that from this quantity we will require a carryover into the season of 1887-88, of 50,000,000 bushels, which is a very small stock, there will be only remaining for export 39,000,000 bushels from March 1 to July 1 next. As the United Kingdom draws her chief supplies, from February 1 to August 1, from this country, this small quantity will not go far. To better understand the situation the following is given. Deducting the stock held by and quantity afloat for the following nations, yet they will require to import from March 6 to harvest the following: United Kingdom, 69,313,000 bushels; France, 25,000,000; and other continental countries, 32,309,000. Total required by Europe, 126,622,000 bushels. This does not include the requirements of the West Indies, Brazil, China, etc. As the available supply for export in Russia is light, and India's crop is not more than average, as also the Australasian crop, the coming season will be entered throughout the world with a smaller stock than ever before known.

The local wheat market has ruled very strong throughout the week, with sellers of buyer season options on Call the principal buyers of sample parcels. There is no doubt but those running the wheat corner in this State and at the East are master hands at the business, and as they do not appear to be short of funds their ultimate success is well assured. Indeed it is credibly asserted that their profits already go into the millions, taking their operations here, at the East and in Europe as a whole.

Crop advices in this State continue favorable, although many sections complain of a want of rain.

Barley has ruled strong, with wide fluctuations throughout the week. The market appears to be under manipulation for a still higher range. The consumption continues to increase, making rapid inroads into the stock held here and in the interior. Several shipments of brewing grades were sent East the past week so as to take advantage of the low freights now ruling.

Oats are firm at a slight advance for all grades. The certainty of a heavy advance in overland freights on April 5, next, causes holders here to advance their views. The supply to come forward from Oregon and Washington Territory is light for the season. The demand is good.

Corn shows increased strength, with small dealers taking hold more freely under the belief that a sharp advance in prices is not at all unlikely in next month.

Feedstuffs.

Hay is without essential change. The demand continues good for choice grades, which are scarce, but poorer grades are in liberal offerings, necessitating concessions to close out consignments. This year's crop will fall considerably below last year's.

Owing to high cost of wheat, compelling many of the small flouring mills to shut down and the larger mills to run on half time, the supply of both bran and middlings has been materially reduced, creating a strong and higher market for both.

Fruits.

Apples are very slow, with a wide range in values running from 75c to $2 per box.

Oranges come to hand quite freely, but find a quick market at current quotations. The demand is both local and shipping up North. The warmer weather has stimulated the demand.

Limes and lemons are stronger, but no advance is reported.

Dried fruits are in light stock, causing a strong market to rule, with a slight advance reported in some. It is claimed that the supply here is barely enough to meet the home demand before next season.

Choice raisins are steady, but off grades are slow and hard to sell; even concessions do not tempt buyers beyond their trade wants.

Live-Stock.

Beef cattle and also mutton sheep are offering on the market more freely, but as yet sellers are not disposed to part with their holdings at a decline, except when compelled. It is claimed that grass-fed cattle will be on the market soon in larger numbers. The consumption of meats is light. Small calves are steadier. Lambs are strong, as are hogs. Milch cows continue in good request, with the more choice fetching good prices. In horses there is a continued good demand for general utility and also matched horses. It is claimed that a better inquiry for work horses will set in soon, for railroad building and other purposes.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7@7½c; first grade, grass fed, 6½@7c per lb.; second grade, 5½@6c; third grade, 5@—c.

MUTTON—Ewes, 6¾@7c; wethers, 7½@8c.

LAMB—Spring, 12½@15c.

VEAL—Large, 5@7c; small, 5@8c.

PORK—Live hogs, 4¾@5½c for heavy and medium; hard dressed, 7½@8¾c per lb; light, 4½@5¾c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

The freight tariff to and from the East under the Interstate Commerce law will go into effect on April 5 next. The rate will be considerably higher than now ruling. This will affect the prices of such articles of the farm as are marketed at the East; but then wool, hides and similar products can be sent by sailing-vessel to the East.

Honey is in moderate supply, but the demand is slow at present quotations.

Beeswax is strong and in good demand.

More inquiry is reported for hops, with sales of choice made to brewers at 20 to 22½ cts per lb. Poor hops are placed with difficulty except at unsatisfactory prices to sellers.

Turkeys are in light receipt. Choice hens, broilers, roosters, ducks, and geese are in limited receipt and fetch good prices.

A further advance in hams, bacon, and lard is looked for at an early day in April.

Salt has been advanced $2.50 per ton.

Wool is dull, owing to the light stock to select from. It is claimed that the receipts of the spring clip will begin to come forward quite freely in next month. Buyers are talking prices down, owing to a reported depression at the East and expected higher overland freights in April next.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	211,165	182,451
In port, disengaged	109,679	58,000
In port, engaged	21,440	26,969
Totals	342,284	257,420

The above gives a carrying capacity as follows: 1887, 547,654 short tons; 1886, 411,872 short tons; increase over last year, 135,782.

Choice dried fruits are in lighter stock, with a slight advance obtainable, although not quoted higher. It is claimed that the supply is not equal to the consumptive demand up to the new season.

Choice raisins are steady and firm, but poor to fair grades are very slow and hard to sell.

Vegetables.

The high market for all kinds of potatoes has had its legitimate effect, viz., the drawing to us of heavy supplies from Oregon, and Utah and Washington Territories. The heavy receipts have depressed the market and reduced prices. The market to-day was somewhat demoralized.

New potatoes under light receipts and a good demand are strong.

Under freer receipts the market is weak at quotations for asparagus, green peas, rhubarb, and new cabbages. Old cabbages for shipping are in good demand at full prices. Tomatoes and cucumbers at the high prices are barely steady.

Onions are weak for all kinds, except very choice hard and sound, suitable to fill distant orders.

San Francisco, March 23, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

B. V. CUTTINGS.

Bordeaux Varieties.

I OFFER FOR SALE, AT $10 PER M., 200,000 CUTTINGS of the following renowned varieties, tule-packed, F. O. B. at depot: Cabernet Sauvignon, Cabernet-Franc, Merlot, Verdot, Malbec, Tinturier, Portal-Ploussard, Mondense, Petite Sirrah and Grosse Blue. Also from $2.50 to $5.00 per M. all other well-known wine and table grape varieties, too numerous to mention. The above Grape Cuttings are from our vineyard, and we guarantee them true to name, healthy, in good condition, and offered at lowest market price. Ten (10%) per cent invariably in advance on small orders. Information furnished, if desired. Will not guarantee cuttings procured for accommodation from other vineyards, but will always select them from responsible parties and in healthy locations. The Burgundy and Bordeaux varieties are very scarce, and parties desiring to plant this winter would do well to secure their cuttings at once, and save money and disappointment.

WHITE ADRIATIC,

SAN PEDRO, SMYRNA, and ENDRICH FIGS.

Præparturiens, Macrocarpa, Mayette, and Chaberte Walnuts, Chestnuts, Persimmons, Mulberries, Olives, Oranges, Lemons, Pears, Apples, Peaches, Apricots, Cherries, etc. Plums and Prunes on Myrobolan Stock, Grapevines, Ornamental Trees, Shrubs, Palms, Magnolias, Clematis, New Roses and Hothouse Plants.

TRY THE PERSIAN MULBERRY.

NO SCALE.—I wish particularly to call the attention of Fruit-growers to this fact. I have repeatedly had my nursery examined by experts, and upon no occasion have they found any scale or any indication of scale. The nursery is isolated from orchards, both old and new, and as I take every precaution in importing new varieties to get only clean stock, I feel perfectly warranted in guaranteeing every tree sold by me free from scale and other pests that are proving so disastrous to the fruit interests of the State. SEND FOR CATALOGUE.

E. C. CLOWES, Proprietor, Successor to W. B. WEST.
STOCKTON, CAL., October 27, 1886.

This is to certify that we the undersigned have this day thoroughly inspected the Stockton Nursery; that we found no Scale or indication of Scale, and that to the best of our knowledge and belief the Stockton Nursery is free of this dreaded pest.

Manufacturers of

INSECTICIDE!

FOR ERADICATING AND DESTROYING ALL PESTS THAT INFEST FRUIT TREES AND PLANTS, SUCH AS

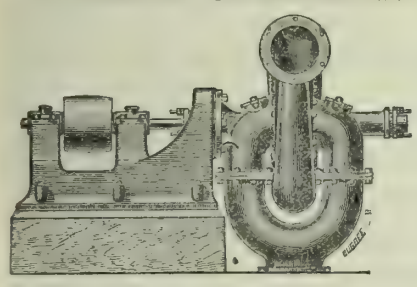
SCALE BUG, HARVEST FLIES, TREE HOPPERS, PLANT LICE, Etc.

It has been fully tested by the Agricultural Department of the State University, and pronounced a success, the endorsement of which we append. It is put up in convenient forms for use both in liquid and paste state.

For Sale in Barrels and 2 and 5-pound Cans in paste form, and in Barrels and 5-gallon Cans in liquid form.

Copy of Letter Received from the University of California, College of Agriculture, Berkeley, dated December 4, 1886.

J. N. KNOWLES, Esq., Manager Arctic Oil Works, San Francisco—DEAR SIR: We have lately tested the Insecticide preparation of Whale-Oil Soap sent by you to us, and have found it to be very effectual against the Scale infesting Orange and Bay Trees here; also against the Thrips. From our previous experience with a similar composition, I think it will be found fully effectual against any small Insect Pests not specially protected like some of the armored Scales, and against which any Wash short of strong lye cannot be used. Respectfully,



E. W. HILGARD, Professor of State University.

ENGINES AND BOILERS

A SPECIALTY.

CANTATAS FOR FLOWER TIME!

Teachers of Juvenile Singing Classes do not need to be told of the intense interest and enthusiasm which attends the bringing out of a new CANTATA. The following are new, bright, pretty and easily given. Commence in time to prepare them.

VOICES OF NATURE; operetta; N. B. Sargent.

FOREST JUBILEE BAND; N. B. Sargent.

NEW FLORA'S FESTIVAL; Bradbury. Arranged by J. C. Johnson.

MERRY COMPANY, or Cadets' Picnic; Collin Coe.

Price of each book, 40 cents, or $3.60 per dozen.

The first two books are by a nature and music-lover, who fills them with very sweet songs of birds, flowers, insects, etc. Flora's Festival, doubled in size, and with minute directions, will surely be a success, as will, in another way, the "MERRY COMPANY."

Our new edition of **VOICES OF PRAISE** (40 cts., or $4.20 per doz.), by Rev. C. L. Hutchins, is cordially commended to all who wish a **Sunday School Song Book** of the highest character.

Schools, Academies and **Seminaries** are always safe in adopting the carefully compiled **School Song Books** of Ditson & Co. We recommend for the higher schools, **SONG GREETING** (60 cents), and **ROYAL SINGER** (60 cents); for grammar schools, **SONG BELLS** (50 cents); and for primary schools, **GEMS FOR LITTLE SINGERS** (30 cents).

☞Any book mailed for retail price.

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO., - - 867 Broadway, NEW YORK.

LIGHTNING WELL SINKING MACHINERY. APPLEGATE'S

Cold Water Bleaching Soap

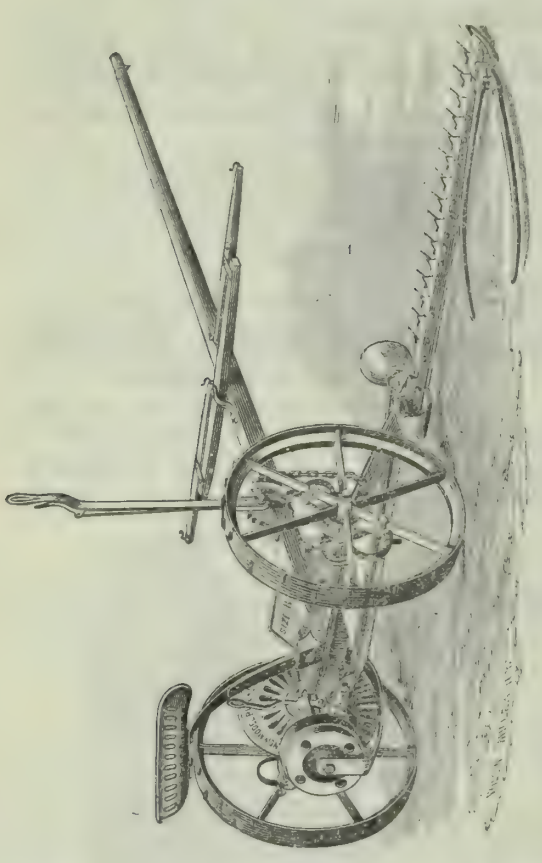
Was Awarded the First Premium at the State Fair at Sacramento, for the year 1886, UPON ACTUAL MERIT.

It can be used in Bath, Toilet or Laundry, and dispenses with Fuel, as no Warm Water or Boiling is Necessary. Beware of Cheap Imitations.

The Genuine is manufactured only by

J. J. APPLEGATE,

No. 12 Bush Street, San Francisco



ADRIANCE "BUCKEYE" MOWERS.

MAKE SURE THAT YOU BUY THE BEST MOWER MANUFACTURED.

One that will Outwear two of any other make of Machine.

One that is very Simply Constructed and the Lightest Draft.

One that will do Better Work than any other Mower made.

SOME OF THE REASONS why the Farmers prefer the ADRIANCE BUCKEYE to all other Mowers:

It is the **most simp e.**
Contains **fewer parts.**
Is the best braced and strongest.
Has fewer and better bearings.
A less number of places for oiling.
All its parts are in sight and easily understood and kept in order by the ordinary farm hand.
It is built on correct mechanical principles.
Has the only perfect double-jointed Finger Bar, which adapts itself to every variety of surface.
There is no downward pressure on the Finger Bar, but a lifting tendency when coming out of a ditch or furrow.
The Knives have a truer and more uniform throw through the Guard Fingers.
Has the most perfect cutting apparatus.
No loose connections or knuckle-joints.
Cuts a swath the full length of the Cutter Bar without driving the off-horse in the standing grass.
It is perfectly adjustable to any work.
All its weight is utilized for power.
The horses draw directly from the axle, and no weight comes on their necks.
It is the **lightest draft.**
It is perfectly balanced.
Easiest to operate.
Excels all others in portability.
The Cutter Bar holds firmly, and flat across the frame.
The most comfortable and the **safest** for the driver.
Only the best material and workmanship are used in its construction.
It requires **fewer repairs.**
Extra parts are more easily obtained.
It has the **longest and best record.**
Its average life is double that of others.

The Majority of the Farmers use it Wherever Sold.

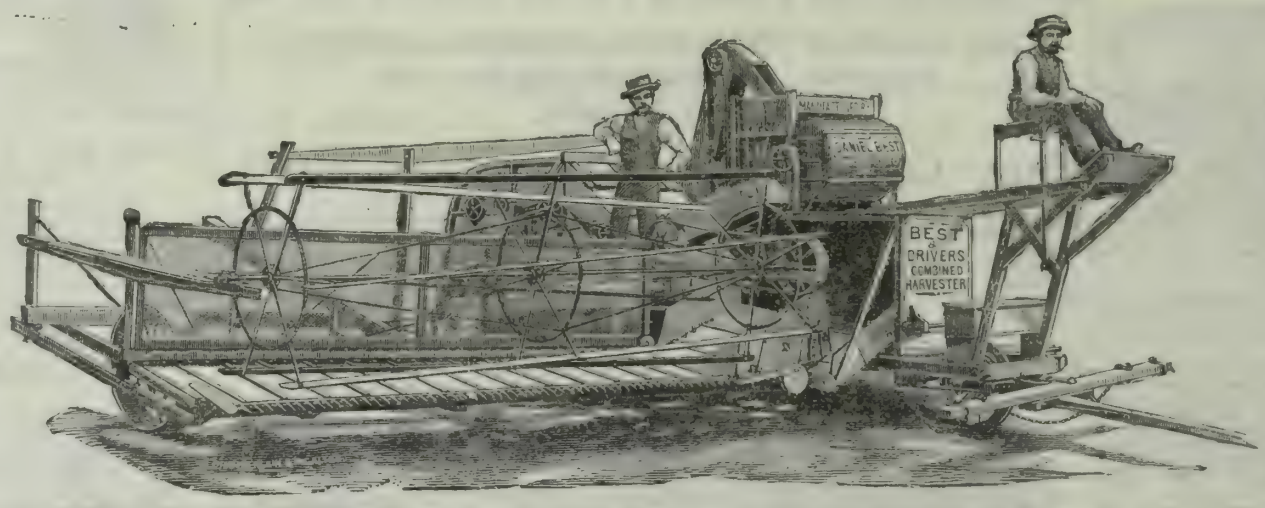
HAWLEY BROTHERS HARDWARE COMPANY, San Francisco, Cal.

BEST & DRIVER'S IMPROVED COMBINED HARVESTER for 1887

Manufactured at the



DANIEL BEST AGRICULTURAL WORKS, San Leandro, Cal.

STANDARD SIZE

—IS—

14 Feet.

Will make any size that is ordered.

Belt

—AND—

Geared.

The BEST & DRIVER IMPROVED Combined Harvester, without doubt, will be the Leading Machine this season, is the verdict of all those who have inspected it.

IT HAS VALUABLE IMPROVEMENTS THAT ARE NOT FOUND IN ANY OTHER COMBINED HARVESTER MANUFACTURED. SPACE WILL NOT ALLOW US TO ENUMERATE HERE; AN INSPECTION OF THE MACHINE WILL CONVINCE YOU.

The Gearing is composed mostly of Spur Wheels, and so compactly arranged that should the frame of the machine weave because of the unevenness of the ground, there would be no danger of the gearing getting out of line, causing it to cut or bind in the boxes, which occurs with other Harvesters in which the gearing is more scattered.

We have succeeded in getting that combination of Lightness, Adaptability and Strength which is the result of thought and skill, taking from some parts and adding to others, making our Harvester from four to six horses lighter draft, and yet retaining as great strength as the heavest machine manufactured. The Header is very rigid and so balanced and hinged that it is no trouole to save down and tangled grain. A boy ten years of age can manage it.

I wish to call your attention particularly to the separating qualities of my Harvester. The agitators are so arranged that the grain is completely shaken from the straw, and my new AUTOMATIC GOVERNOR on the fan completely governs the blast on the shoe, so that at any speed which the machine travels, the blast will be the same. Making a saving of a great amount of grain that would otherwise be blown over the riddles; but, instead, will go into the sack, which in a season will more than pay the harvestin expenses, over and above any **Combined Harvester** that has not the **Automatic Governor.**

Each **Harvester** has one of my celebrated **Grain Cleaners** ttached, which needs no recommendation from me, as the grain growers of California can testify as to its merits and superiority over other Cleaners on the Coast.

Every machine is thoroughly tested before it is allowed to leave the factory, so there will be no trouble or vexatious delays in the field. The Lumber is thoroughly kiln dried that we use in the construction of our Harvesters, so that they will not fall to pieces under a hot sun.

Please call at my Works, near the Depot, San Leandro, and examine our Harvester. I have sample machine belted and attached to the power of the factory, and will take pleasure in showing how it works, so that you can become familiar with the working of the machine before taking it into the field.

IMPROVED GRAIN CLEANERS, and MILLS.

I desire to call your attention to my latest Improved Cleaners that I make for any and all Combined Harvesters. The great success I have had with my Cleaners, made to run with Thrashing Machines, as well as the satisfaction given by my Fanning Mill and Warehouse Mill, induced me to design and build a Cleaner, especially for the Combined Harvesters. I make the following sizes, viz:

45-inch for 18-foot cut and over.
40-inch for 14 to 18-foot cut.

This Cleaner is the most successful Combined Harvester Cleaner ever offered to the public, and I can guarantee it to be the most perfect Cleaner now in use. I have made a great many valuable improvements that have never yet been introduced, the merits of which will be quickly understood and highly appreciated by those who have use for the Cleaner. It is made strong and durable, and of such size and capacity that it will easily handle and thoroughly cl an the grain as fast as any Combined Harvester will thrash it, and it has proven to be the only Cleaner mounted on Harvesters, that will thoroughly clean foul grain, and make it merchantable.

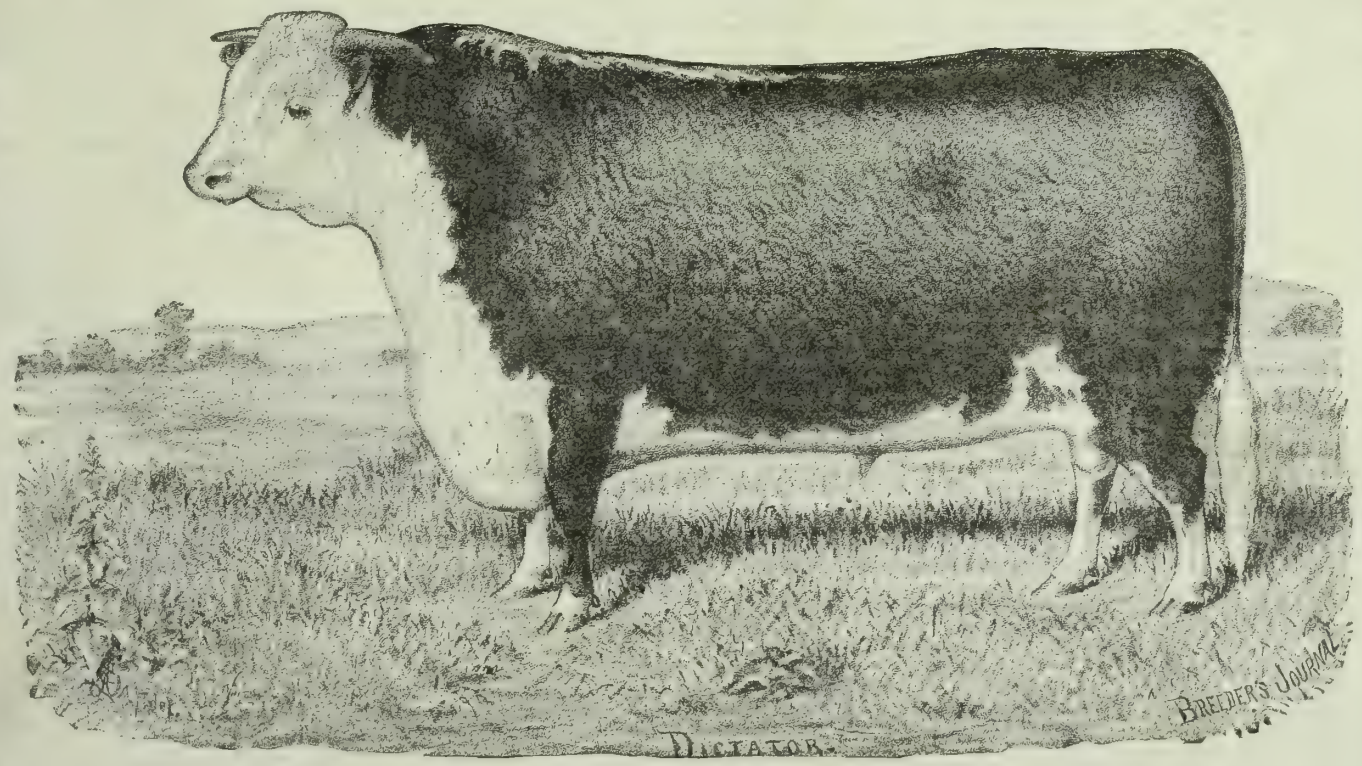
PACIFIC RURAL PRESS



TWENTY-FOUR PAGE EDITION.

Vol. XXXIII.—No. 14.] SAN FRANCISCO, SATURDAY, APRIL 2, 1887. [$3 a Year, in Advance. SINGLE COPIES, 10 CTS.

Herefords for California.

Mr. Albert Gallatin, some three or four years since, made a purchase of a few head of thoroughbred Hereford cattle for his ranch in Tehama county. The past summer he made another purchase of fine bulls from the Messrs. Miller, of Beecher, Ill. He has made careful note of these purchases and their produce, and has become so well satisfied with their merits for beef purposes in California, that he has made another and more important purchase from the same parties, of 22 thoroughbred Hereford heifers and two bulls, making with this and former purchases one of the finest, if not the finest, herd of thoroughbred Hereford cattle on the Pacific Coast.

Cattle of this breed are noted for their grazing qualities and for the fine character and quality of their meat from grass. Hereford breeders claim that in these particulars their cattle excel all other beef breeds. These characteristics are not newly claimed, but the breed has had this reputation as a breed for more than 100 years in England, as being capable of making the largest gains from grass of any of the breeds, and of going from grass to the top of the market at Smithfield, London, Eng., during a century past. The claim is that other prominent breeds of beef cattle to reach this position are obliged to be stall-fed for from four to six months.

THOROUGHBRED HEREFORD BULL DICTATOR.

California will make the most favorable home for this breed of cattle, with its climate of continuous summer, insuring continual growth and early maturity upon the mountain grasses during early spring and summer, and finishing on the alfalfa fields in the fall and winter. Being, as thus shown, pre-eminently a grass breed, they are specially fitted for the Pacific Slope. Mr. Gallatin has studied these questions, and has chosen the Herefords as likely to give the best results to be obtained from the soil of such portions of his property as he desires to devote to grazing.

The last purchase of Mr. G. is from one of the oldest herds in the States, which owes its excellencies to the selection of the best lines of blood existing in England or America. The leading sires that have been used are as follows: Sir Charles, No. 543; Success, No. 2, whose portrait was given in the RURAL some years ago; Winter de Cote, No. 2977, and Ivington Wilton, No. 4056. The portrait upon this page is of the bull Dictator 2d, several of whose progeny are now in Mr. Gallatin's herd, as will be seen by the list below.

The following is a short sketch of the breeding of the animals included in the late purchase, and which is the occasion of this notice:

Alexander, No. 2480, by Dictator 2d, No. 6505; Sir David, No. 2481, by Success, No. 2; Lovely Clover, 13028, by Ivington Wilton, No. 4086; Miss Dauphin, 20,291, by Dauphin 18th, No. 3368; Lady Edwards, 28,232, by Doctor Edwards, No. 6477; Vesper 2d, 24,966, by Hermit, No. 7293; Clover Cherry 2d, 25,249, by Ivington Wilton, No. 4056; Lucky 2d, 25,250, by Ivington Wilton, 4056; Lucile, 27,121, by Hermit, 7293; Miss Maude, 24,963, by Ivington Wilton, 4056; Bess Bedford, 27,132, by Frederick, 7398; Cruik 3d, by Doctor Edwards, 6477; Graceful, 24,815, by Dictator 2d, 6505; Lady Graceful, 24,812, by Dictator 2d, 6505; Jessie Maxwell, 26,356, by Highland Chief, 7275; Lady Bess, 13,041, by Ivington Wilton, 4056; Penelope, 24,960, by Hermit, 7293; Minerva, 24 961, by Hermit, 7293; Wilton Maid, 24,964, by Ivington Wilton, 4056; Susie, 13,803, by Winter de Cote, 2977; Dolly Varden 5th, 16,300, by Winter de Cote, 2977; Highland Queen 4th, 20,068, by Winter de Cote, 2977; Leone Miller 2d, 20,071, by Dictator 2d, 6505; Patience Edwards, 24,871, by Winter de Cote, 2977.

This is certainly a fine lot of animals, and we are glad to make prominent their arrival in California. Mr. Gallatin is doing much for the advance of our live-stock interests by securing such blood in abundance, and we trust may find his investment profitable. His idea in the development of his fine property in Tehama county is an enterprising one. He desires to demonstrate its fitness, and indirectly the fitness of the State at large, for a wide diversity of agricultural productions, believing that such a course of farm policy in California will be both the safest and at the same time result in advancing general wealth and prosperity as can be done in no other way. We shall be glad to note at some future time other ways in which Mr. Gallatin is moving forward to prove the truth and practicability of his policy of farm management.

THE Board of Trustees who are on a site-selecting tour for the branch Normal School, are at Red Bluff. The competing towns have done their best to show off the advantages they possess for such an educational institution.

Lumber Notes.

FROM all indications the coming season will be a busy one for carpenters and builders. Already the sound of the hammer and saw is heard in the outlying portions of the city, and when lumber stocks become heavier and prices become less stiff, there will be a rush of work in the building line. In anticipation of these lively times the sash and doormakers are working up large lots of their lumber stock, which will, no doubt, all be off their hands before the middle of the season.

A WINDFALL (redwood) lies near the Bohemian park at Camp Meeker, on Russian river, that will measure over 22 feet inside of the sap and bark; and they often grow over 350 feet high, and would make nearly 100,000 feet of sawed lumber. One tree less than 11 feet on the stump made 53,000 feet, 37,000 feet of it being clear lumber, and all sold for $1350.

A LOG 32 feet in length was placed on the carriage in a Puget-sound mill recently, and when half of it was sawed up there were 38 boards four feet wide, aggregating 3600 feet of lumber. The other half of the log was sawed into smaller planks, but the whole footed up 6400 feet of lumber from one spruce log without a knot.

THE Visalia *Delta* says that Smith Comstock, whose mill is in the Sierra, will cut 4,000,000 feet of lumber this season. He has already sold the cut to the San Joaquin Lumber Co., the greater part of which will be delivered in Visalia.

ONE firm at Los Angeles, recently, had seven schooners unloading lumber at San Pedro, on board of which were 2,100,000 feet of lumber. The enormous amount of building going on in that region makes the lumber business lively.

HURON, Fresno county, is to sink an artesian well to a depth of 1000 feet.

Moving for Irrigation.

One of the best possible proofs of the wisdom and practicability of the irrigation work done by the last Legislature is the alacrity which the people show to co-operate and thus secure the benefits of the enactments. The Wright bill, which we have published in full, seems certainly to suit the public needs, at least so far as preliminary steps in formation of irrigation enterprises are concerned, and this is the object for which it was devised. "The most representative meeting ever held in Placer" took place in Auburn on March 19th to consider the subject of irrigation. Nearly 200 leading men were present. The sessions began early in the morning and continued all day. A stirring address was delivered by J. P. Whitney, who was chosen chairman, in which he said: "It appears desirable that a careful and conservative view of the situation should be taken, and that we should seek out and satisfy ourselves, as well as we can, what is our source of supply, and how we can best avail ourselves of it."

This advice to Placer county people with reference to the Wright law has general application to California people and should incite them to act quickly and enterprisingly. The meeting at Auburn evidently profited by the chairman's advice, for they at once appointed a general committee of 20, with power to appoint a sub-committee, with these instructions:

Resolved, That it be the sense of this meeting that the sub-committee appointed by this meeting be required to investigate thoroughly the sources of water available for possible public purposes, and the probable amount of land in Placer county subject to or available for irrigation; also the sources and amount of water available but now controlled by persons, companies, or corporations, and the offers or inducements any or all of said persons, companies, or corporations are prepared to offer toward supplying the said available irrigable land in Placer county with water, and such other information as they may deem advisable.

Resolved, That it be the sense of this meeting that the said sub-committee be allowed their actual expenses and two dollars a day for the time necessarily employed in making the said required investigation.

The sub-committee was well chosen as follows: P. W. Butler, G. D. Kellogg and L. F. Warner, with W. B. Hayford as alternate.

This shows how to go to work in the public interest under the Wright law. An important consideration, however, is the collection of funds. The Auburn meeting collected over $200 in a few minutes, starting well, however, with $100 from Chairman Whitney.

The meeting warmly approved the injunction-dissolution law, which can be found in full on page 301 of this issue.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

From the Ranges of Southern Humboldt.

EDITORS PRESS:—Enough time has elapsed since the heavy snowstorms of February to get a pretty reliable account of the real damage sustained by Southern Humboldt, and it turns out that the real is not nearly so bad as the imaginary. In fact, it cannot be said that most of the ranges suffered any, for nearly all of them have low ground that was not covered by the snow. Only the very high ranges were entirely covered, and on them the losses were much less than was anticipated. This winter has been a very good test of the value of this section for stock. At the time stock were suffering for feed in Central and Southern California, because there had been no rain to start it, we had plenty of grass—and for almost four months, too. And now, where not stocked too heavily, the grass is from 6 to 12 inches high. We can also show grain, sown in December, 14 to 16 inches high. We never fear a drouth, neither cold weather.

A glance at a map which shows Eel river and its tributaries will give the key to our safety even in a snowy winter like the past. Our ranges, for the most part, run from the backbone between these streams, down to the streams themselves, giving each of us considerable low range, with elevation from 500 to 1500 feet, upon which snow falls, and when it does only remains a few hours. These slopes are very productive, furnishing a large amount of fuel.

The grass starts with the first rains, which usually fall about the last of September or first of October. Among the first to start are wild oats, filaree or alfilarilla, and the by-some-people-much-despised foxtail. This last is one of the best winter grasses, growing faster in cold weather and starting earlier than most of the wild grasses. It is very nutritious as long as it is green, but is a poor dry feed. But in summer, stock never suffers in this country, as there is plenty of feed to the very top of the highest mountains. Besides, we shear our sheep before the foxtail gets dry, so on the whole we suffer nothing from it, but are benefited much. We also have six or eight varieties of clover, wild rye-grass, and, on the high ranges, bunch-grass.

If there is any better place for stock in the State we have not seen it, nor have we seen the man who has. Most of us have a fine crop of lambs, though some missed it, being in the midst of lambing when the snowstorm came; hence, many that were dropped in the storm were lost, but we doubt if any that ever suckled the ewe were killed by the snow. What may seem a little strange, hardly any two ranchmen think alike about the best time for lambs to come, and the consequence is, you may see them coming all the way from December to May. Most of them, however, are dropped in the months of February and March.

The weather is very fine now, reminding one of June in some of the Eastern States. Our fruit trees are in full bloom, while on the high mountains, a few miles away, old winter still holds the fort, and with his snowy mantle seems to bid stern defiance to summer's jaunty green jacket on the slopes below.

Was there ever a country so much boasted over as this California of ours? Ay! and is there another that so well deserves it? No wonder that many of the shivering people from east of the Rockies are flocking to this summer land. If they could only realize that "north" in California is not a synonym of cold, then this part of the State might receive its share of attention from home-seekers.

We have no sand and sagebrush that must have a water ditch to reclaim it; but instead, we can offer them land that by reason of bountiful rain has always in sight proof of *its* fertility. RANCHER.

Blocksburgh, Cal., March 20, 1887.

A Voice from Contra Costa.

EDITORS PRESS:—We of Contra Costa county have lately waked up to the fact that we are being neglected. While hosts of Eastern tourists are pouring into the southern counties, and the tide of immigration is setting thither, no one ever seems to think of looking in upon us. Almost within sight and sound of San Francisco, with a climate and a soil unsurpassed by any in the State, we are quietly ignored, and the stranger in search of a home remains unconscious of our very existence. Do you wonder that, considering these things, our soul is stirred within us? Within the last month there has been a grand uprising. The county papers have come to the rescue. They have called upon the people to assert themselves, and there has been a very general response.

A board of trade has been organized, meetings have been held, we have resolved ourselves into a mutual admiration society, and the outside world is challenged to pause, to look and see and judge for itself if we, too, have not something to be proud of.

In a county of such extent as Contra Costa, covering 470 square miles, and varying in altitude from the sea level at Martinez to the summit of Mt. Diablo, at an elevation of 4000 feet, there must necessarily be a wide range of temperature and of agricultural products. To discuss the merits and set forth the attractions of the entire county is beyond my province. I must content myself with calling the attention of your readers—some of them, it may be, intending immigrants—to the beautiful valley in which my lot is cast.

The Valley of the San Ramon.

The village of Walnut Creek, which lies at its northern end, is easily reached from San Francisco, a daily stage leaving Oakland in the forenoon and bringing the visitor over 17 miles of an excellent mountain road, where at every turn some new beauty breaks upon the eye. The drive from Martinez, where another stage-line connects with the morning train of the Central Pacific from San Francisco, is shorter, but less picturesque. Arriving by either route, the stranger can scarcely fail to be charmed by the beautiful situation of the little village. It lies half hidden among the trees, with the hills gradually sloping upward on every side, fertile fields, thriving young orchards and vineyards, meeting the glance in every direction, while at a little distance rise the steeper summits of the Coast Range, and still beyond Mt. Diablo towers up majestically against the sky, a thing of beauty and a joy forever to any one with an eye for Nature's glorious works.

The two streams which unite at the village (Walnut creek and the San Ramon) can be traced all along their winding way through the neighboring fields by the oaks, sycamores and willows which fringe their banks and are now rapidly bursting into leaf.

Following the county road in a southerly direction through the valley, I am attempting to describe the hills draw nearer together on either side until there is but a narrow strip of level land on the right hand and on the left; but a little farther on the valley widens again, the hills recede and gradually lose their steepness, the natural growth of forest trees disappears, and all along the rolling slopes one can trace the lines of the young fruit trees in the newly planted orchards and the rows of cuttings in the vineyards. Only a short time since there was nothing raised but hay and grain on all these ranches round about. Now there are acres upon acres of fruit trees and vines, and every year is adding to their number.

For the great charm of this region is that irrigation is a thing unknown. There is always rain enough to make some return to the farmer for his labor, even when some other portions of the State are suffering from drouth, and neither in nursery nor in orchard is it ever found necessary to supply the trees with water. All the fruits of the temperate zone grow with us in perfection—cherries and plums, apples and pears, peaches and figs as fine as one can wish to see; grapes in endless variety, almonds, a most profitable crop; and to the list we hope soon to add, with Mr. Gillet's help, walnuts of the improved varieties.

But we are not in the true "citrus belt." If one wishes to engage in orange culture, he must go elsewhere. I say this although there lies on the mantelpiece before me a ripe orange grown in a sheltered nook among the hills not two miles distant. Such favored spots may be found here and there, and at Martinez, 12 miles away, there are orange and lemon trees loaded with fruit, the waters of the bay tempering the winter atmosphere.

But in our valley we are not semi-tropical, and some of us are glad of it. We like the touch of the frost-king coming now and then through the winter months, which otherwise we might forget to call by their right names, so soft and balmy is the air in general, so warm and bright the sunshine. We think we are all the better for his flying visits, and we fancy they are the cause of the wonderful healthfulness of the neighborhood, where no epidemic disease has ever been known to gain a foothold.

We like, too, our nearness to the Bay of San Francisco. When occasionally, in the summertime, the sun glows with a too fervid heat, and the mercury climbs up to 100 and even higher, we turn our eyes longingly in the direction of the city. And always after a few days we catch a glimpse of a low, cloudlike bank lying beyond the distant hills. Gradually it is lifted higher and seems to be driven rapidly along the horizon. It does not reach us, the sunshine is never dimmed, but we feel the breath of a cool, refreshing breeze, down goes the thermometer, we close the doors and windows, put an extra blanket on the bed, and go to sleep with grateful thoughts of "the San Francisco fog."

Taken all the year round, summer and winter, we think the climate as near perfection as is possible, with just enough variety and no great extremes. It is thoroughly comfortable and enjoyable. And as for the soil, the most inexperienced eye has only to see it as it is turned over by the plow to be convinced that it is "as good as the best."

At this date (March 17th) the peach trees, apricots and quinces are in full bloom, and the bees are busy in their branches all the day; the almonds have shed their blossoms and the young nuts are the size of peas, though they were late this year from the long delay of the rain.

I am not a real estate agent, and I have no axe to grind, but if any one asks, "Is there land for sale on reasonable terms in this happy valley?" my answer is that given me 10 years ago by a friend to whom I was lamenting the narrowness of our own portion: "There is always land to be had when you have the money." And I may add that prices are not exorbitant compared with those in other sections.

The high range of hills between us and Oakland has isolated us long enough. When we have a direct line of railroad, which we confidently expect, there is little doubt that the land in our beautiful valley will be eagerly sought for country homes, and those who are wise enough to secure them now will then have cause to congratulate themselves. I. H.

Walnut Creek.

San Diego Notes.

EDITORS PRESS:—The Coronado Beach Co. afforded all visitors to Los Angeles the opportunity of making an excursion to San Diego at a nominal expense, and I availed myself of it. We were landed in San Diego about 8 o'clock P. M. on March 3d. An agent passed through the train and apportioned us off—so many to each hotel—and we were thus comfortably provided for without a jam, as is usual with excursion parties of this size, as we numbered about 750 in all. It does great credit to San Diegoans' managerial ability to take care of so many extra, with the naturally large transient travel now rolling in upon them. Our excursion tickets included a trip across San Diego bay and a ride on their railroad across the peninsula, and, truly, they have the most beautiful location in the world, we might say, for their beach is certainly unsurpassed anywhere on this coast. They have the whole peninsula laid out in town lots and a great many have been sold, and they are now busy grading for an immense hotel building. This will, without a doubt, be completed the coming season, and they will then be prepared to accommodate tourists in fine style.

Many Eastern people have here purchased lots and are now erecting cottages so as to have a place to migrate to in the cold winter months.

San Diego bay, as a safe harbor, is second to none on the Pacific Coast, as it is completely land locked, and with the opportunities that will be afforded soon for transcontinental shipping, will no doubt make it a shipping point of no little importance.

Within a few miles of San Diego are a number of very fruitful valleys, where oranges are produced in abundance, and they are really very fine, and the capitalists of the town are making every effort possible to get all the available water together and utilize it, in making their mesa land productive, as water is literally the one thing needful to make this a land flowing with milk and honey.

The most abundant production at present is certainly town lots, and real estate agents for miles on each point of the compass from the town proper have tracts laid out in lots, varying in size from 25 feet front to 5 and 10-acre plots, all sizes and shapes, to suit the size of each man's purse. Our old-time Californian is nothing if he is not speculative, and he is here in force buying on margins, shorting the market whenever he can get a pointer.

San Diego has taken a fine start. Men of means and energy have taken hold and are pushing it to their utmost. It is now literally the coast terminus of the Atchison, Topeka & Santa Fe road, and the Southern Pacific will have a line running in within six months. There seems not the slightest doubt of building up a city of 15,000 or 20,000 people. They now claim 12,000, but that is probably too many; but as they are now at work on a census, the number will be accurately determined ere long.

There is also a prosperous mining district tributary to San Diego. The Julien mines are some 60 miles distant, but get all their supplies through San Diego.

There is a fine street-car line running from the depot up through town and out to Twenty-sixth street. There is also a motor line building between there and National City. All these improvements have been made in the past year. A number of fine, large brick blocks have been built, three, four and five stories in hight. All these show the solidity of the men who are pushing the interests of the town.

The tone of my letter might indicate that I have corner lots to dispose of, but I have not a foot, and am only sorry I have none; but there are ample for all who wish without my going into the business. R. G. H.

San Diego.

Morning-Glory Once More.

EDITORS PRESS:—I see that the morning-glory still comes in for a share of the attention of your readers; and as a "fellow-feeling makes us wondrous kind," I feel like making a little addition to what I reported some months ago of a fortunate riddance of a 12-year-old glory patch. After much pulling, digging and salting, all efforts to kill it had ceased for several years, when a grasshopper invasion struck it in full growth and vigor, and in four days left not a vestige of it above ground. It did not show a sign of life till late the next spring, and then only a few straggling vines, which with their lessening successors were soon dispatched with a hoe, till now, nearly three years after, there is no sign of it above ground. Remembering the report of some one who had made a success of hoeing it off, two inches under ground, as often as seen, reminds me that that was the only remedy I ever found for Canada thistle "back in the States," and I incline to the opinion that such shutting off of sun and air will kill any root. M. W.

Paskenta, March 18.

ENTOMOLOGICAL.

Spring and Summer Remedies Against the Codlin Moth.

[*Bulletin No. 6, State Board of Horticulture.*]

It is needless to write at length about the ravages of the codlin moth, and of the importance of finding a thorough remedy against the pest. In a paper read before the Fruit-Growers' Convention, held in November last, I expressed the belief that spraying with arseniates were the most promising of anything yet tried for this purpose. I also maintained that while the remedy, doubtless, would prove efficacious, killing the codlin larva if used often enough, it would be a little premature to recommend it as *the remedy*, because of the very poisonous nature of the compounds, and that we needed a thorough trial to settle definitely the all-important question if either of the arseniates would be of any danger to the consumer of fruits so protected. Since expressing this, I have been in active correspondence with the State Entomologist of Illinois, Prof. S. A. Forbes, and I feel happy to state that his thorough experiments, although made on a comparatively small scale, have proved to my mind that in the climate of the Eastern States, the arseniates can be made a decided success by proper application, thereby saving two-thirds of an apple crop, and that there is no danger in using either of them in that climate, that is, if used in season. The Bulletin, No. 1, of Professor Forbes, was kindly sent to me, and I have freely quoted from it in the following. Professor Forbes has reached the following conclusions: That the results of once or twice spraying with Paris green in early spring before the young apples had drooped upon their stems, resulted in a saving of about 75 per cent of the apples exposed to injury by the codlin moth.

The arsenic remedies have, to my knowledge, been used by several persons in this State, but while they have been more or less successful, yet, except in the case of apples sprayed with arsenic solution by Messrs. Little and Ousley, in the Santa Clara valley, as mentioned in my paper, no official analysis has been made of fruit treated with arsenic. These apples were found perfectly free from any trace of arsenic, although sprayed twice, and in the case of Mr. Ousley 50 per cent of the fruit saved. It must, however, be borne in mind that while arsenic, or arsenious acid, is very soluble—in fact, is dissolved by the least moisture—Paris green and London purple are not, and will remain on the fruit even after heavy rainstorms, as has been proved by recent analysis, in Illinois. Hence these must be regarded as *decidedly dangerous when used late, when the apple has size, and is hanging down.* It seems that it is the actual growth of the apple that throws off the poison, as none has been found on fruit treated early, in the Eastern climate. If there be any possible danger from the use of these substances, it will be determined definitely, and we shall bear this point especially in mind in our experiments this summer. We ask every one disposed to experiment to note carefully the time and manner of application, the condition of the fruit sprayed, and also the state of the weather. A number of samples of fruit thus treated and analyzed will settle the question of the danger to the consumer.

Paris Green.

Paris green is a compound of arsenic and copper. It is a far more powerful poison than arsenic alone, and is not soluble in water, hence will remain much longer on the trees. As stated before, in the Eastern States it is used in preference to arsenic, as it is not so liable to be washed off by rain; and another advantage is that it will not hurt the foliage, except when used in an overdose. Such at least is the report from the East. I have taken considerable pains to ascertain if any damage has resulted from its use in this State. I have learned recently, on a visit to Contra Costa county, of Mr. Treat, that peach trees treated with Paris green for the purpose of killing diabrotica beetle, suffered severely, but used upon apples and pears it had no bad effect. Doubtless it will be found that Paris green in market will vary in strength; the proportion to be based on the percentage of 15 per cent arsenic. The price of Paris green in San Francisco, by the small quantity, is 25 cents per pound.

Proportions Used.

One pound of Paris green to 54 gallons water is the strength used by Professor Forbes for his successful experiments. Other parties claiming to have been equally successful have used only half the strength. The Paris green is stirred and mixed with the water and kept constantly stirred while being sprayed.

London Purple.

London purple is another arsenical compound. It is the residue from the manufacture of aniline dyes, and contains lime, arsenious acid, and carbonaceous matter. It is more soluble, more adhesive, less poisonous, and less expensive than Paris green.

This compound in San Francisco is worth, by small quantities, 25 cents per pound, and by larger quantities, 22½ cents. It is mixed to a paste and then diluted. Professor Cook, of Michigan, recommends one pound to 50 gallons of water; others, as little as one pound to 200 gallons. We intend to try these different

strengths ourselves, but should not recommend less than one pound to 100 gallons. As the compound contains some arsenious acid, it would be advisable to use it on cloudy days if possible, as it might damage the foliage.

White Arsenic, or Arsenious Acid.

One pound to 200 gallons water, the arsenic being first dissolved by being boiled with caustic potash. Experiments with this compound in Santa Clara accomplished considerable good, and, it is plain, without any danger to the consumer; but in nearly every case the foliage of the trees has been damaged—in some cases badly, in others partially; and in only one case, where the application was made during the morning of a cloudy day, no damage was caused to the tree. Although less promising than any of the other remedies, it deserves trial.

Manner of Application.

It is of great importance that when applied the poison be well mixed in the water, and in the case of Paris green and London purple it is necessary to select such nozzles as do not clog. The mixture should be thrown over the tree so that every apple or pear is wetted, as it is by actual poisoning of the fruit that the egg or worm is killed. Thrown with a fine spray, two and one-half gallons of the mixture will suffice for a large apple tree.

Time of Application.

For reasons before mentioned, it is essential that the poisoning be done early. The first application should be made when the fruit is out of bloom. The second, 10 or 12 days afterward. If a third application be made—but it is to be hoped that would prove unnecessary—it should be done later than four weeks after the first.

Measures to Catch the Larvæ.

Banding System.—This mode of protection, which has been practiced in the Eastern States, has been tried in this State more than any other. Its usefulness is based on the observed habit of the larvæ when leaving the apple to seek shelter under the bark. The band about the tree provides artificial shelter for the worm, and the majority of the larvæ no doubt find their way to this; but a sufficient number for giving future trouble find other hiding-places on fences, buildings, etc., and perhaps more than anywhere else under clods at the foot of the tree; and it is here in an old orchard that I have almost invariably found cocoons. To make the banding system more effective, the ground right around the tree, as well as the whole orchard, should be thoroughly pulverized. The greatest obstacle to the success of the banding system is the neglect of one orchard-owner, while his neighbor conscientiously and thoroughly performs the work. The neglect or half-done work of one person among his trees is sufficient to counterbalance the attentive and thorough work of many others around him. The difficulty, in so many cases, of doing anything really satisfactory, I think is due to this want of co-operation. In my own orchard, in the Santa Cruz mountains, comparatively isolated, very fair results have been obtained. It is evident that in a thickly settled community, unless all concerned do their duty, the work will be largely in vain.

Picking Off Infested Fruit.

The practice of picking off infested fruit, of course, comes under the same head as the band system. In that it aims at a reduction or extermination of the next brood, it should go hand in hand with the band system. It is also open to the objection that unless the neighbors do their duty, little good is accomplished.

Whenever feasible, the custom of keeping hogs in the orchard is a good one, as in this manner all the wormy fruit is devoured, this naturally greatly preventing the increase of the moth.

A Los Gatos Wash.

Editors Press:—In your issue of March 12th I notice an article from the Willows, Santa Clara county, signed "R.," about sal-soda as a wash for scale. Also a reply by Prof. Hilgard. I will give you the formula of a wash that we use here with great success:

Twenty-five gallons of water; 25 pounds of sal-soda; 1 pound of good sulphur; 1 pound of saltpeter; 25 pounds of whale-oil soap, or 1 gallon whale-oil "foot," and a half sack of tobacco stemings.

Put the water in an iron kettle, take a burlap barley sack half full of tobacco, put in the sulphur with the tobacco, tie up the sack, place it in the kettle and let it boil for an hour and a half or two hours. Take the sack out, place it on two sticks over the kettle till it is well drained. Now add the sal-soda, then the saltpeter, and last add the whale-oil "foot" or soap. Let this boil for 10 or 15 minutes; then add 15 gallons of water. This will make you 40 gallons of the very best wash, which I apply hot with one of Bean's automatic air-pressure spray pumps. Dig the earth away from around the tree six or eight inches deep if the tree has scale, and apply the wash. It is almost impossible to kill all of the scale with one spraying, but the second or third time will always leave your trees clean, healthy and thrifty. I spray at any time after the leaves fall till the tree is ready to bloom. This wash is a good fertilizer, and is not expensive. Where there is no scale, I add 10 gallons more of water, which makes 50 gallons of rich fertilizing wash. A. N. Van Fleet,

Fair View Farm, Los Gatos.

The Stock Yard.

The Nevada Cattlemen.

The annual meeting of the Nevada Live-Stock Association was held in Reno, March 15th. E. W. Crutcher, president of the association, called the assemblage to order, and the secretary, R. W. Lewis, was in his place.

President Crutcher delivered an address from which we quote the following paragraph:

Allow me to inform you that through the influence of this organization we have secured the passage of some good and necessary bills, among which is a law forbidding the importation of contagion into and through our State. This is the absorbing question among our Eastern brethren, and it is a matter which we should all prepare to meet, for as sure as you handle cattle, you are "a gone gosling" if it ever reaches our herds. Securing just and equitable rates on transportation of live-stock is another matter which demands the attention of shippers. What effect the Interstate Commerce law will have we cannot tell. We will be subject to the regulations of what is known as the "long-haul" clause. It is generally conceded among cattlemen that the ruling rates here are sufficiently high to guarantee a standard by which the short-haul tariff could be amicably adjusted. It is not with the expectation that anything we may say on the subject of freight rates will result with any relief to cattle-shippers that we call your attention to the consideration of the question. It is for the purpose of eliciting discussion on the subject.

We are all engaged in raising of stock of various kinds and breeds. I hope we will take more interest in our State Agricultural Society. The stock exhibition is one of the most attractive features of the fair, and I hope you will all contribute something to its support and final success. Competition is one of the main secrets of success; without competition there would be no strife, and it is competition that causes men in breeding to excel.

From some cause our detective bureau has not given entire satisfaction. Some attribute it to the want of vigilance, some to the want of discretionary power on the part of the chief detective and those under him, others to the want of proper laws to convict and the moral support of the people. When men who claim to be exemplary citizens will interest themselves in behalf of those who defy the law, by obstructing in every conceivable manner the conviction of criminals, it is certainly poor encouragement for detectives and officers whose duty it is to see that the laws are enforced.

New Members.

Mrs. M. C. Lewis, H. F. Gambler, Lander county; J. G. Ford, M. D. Foley, Geo. W. Grayson, Eureka county; S. W. Cross, Elko county; W. S. Bailey, Churchill county; J. V. McCurdy, L. Giroux, G. S. Nixon, Humboldt county; Allen C. Bragg, Washoe.

Secretary Lewis' Report.

The secretary reported the receipts for the year $6675.33; expenditures, $8669.08; leaving, besides dues not yet paid in, a debt of $1413.75. The secretary's report also contained the following:

"The following movements of cattle have been reported to this office from January 5th to March 9th, inclusive:

Head of cattle shipped west	27,300
Head of horses shipped west	840
Cars of sheep shipped west	132

"Our inspector's department has for the past year been under the management of a chief, assisted by specials, and many cases of alleged theft, etc., have been examined into and acted upon by them. Surroundings beyond our control make it difficult to secure equitable protection for live-stock interests, although the sufferers be citizens and residents of a land of enlightenment and vaunted justice. The obstacles thrown in the way of our efforts for the suppression of crime are beyond credence, and are only fully appreciated by the executive of this association. Unsatisfactory as the work of this association may appear in some respects, its beneficial influence is seriously felt in the homes of thieves.

"Our representatives in Washington recognize our rapidly growing stock interests, and we feel that in them we have honest, able and faithful friends for the right.

"We have retained our membership in the Consolidated Cattle-Growers' Association of the United States, and bespeak for it our warm support, sympathy and representation, and, although many of its principles are foreign to our needs, we observe in the institution a spirit to secure for our interest the greatest possible good for all concerned. The building up of this association, so that it would possess the power to enforce its reasonable demands, would add greatly to our welfare."

New Officers.

The president and secretary declined re-election. The following officers were then chosen: President, George Russell; secretary, George S. Nixon, of Winnemucca; treasurer, Frank Sweetzer, of Winnemucca; executive committee, Geo. Watt, Lander and Nye; T. D. Page, Eureka; A. C. Cleveland, White Pine and Lander; E. C. Hardy, J. R. Bradley, Jos. Scott, J. B. Yaret, Elko; J. V. McCurdy, Orlando North, Jerry Hearn, R. W. Lewis, E. W. Crutcher, Humboldt; T. R. Rickey, Douglas and Ormsby; Louis Dean, Allen C. Bragg, Washoe; C. H. E. Hardin, Esmeralda and Lyon; Isaac Foster, Grant county, Oregon; N. H. A. Mason, Malheur county, Oregon; W. S. Bailey, Churchill.

Sheep and Wool.

Angora Goats.

Editors Press:—The class of Angora goats that farmers or ranchmen should procure depends entirely upon the size and capacity of the land suitable for a goat pasture which a person owns or controls, and upon the amount of money he wants to invest in the enterprise. On a small place, where only a few goats can be kept, take the best animals you can obtain. The mere name of "pure-bloods" (which, owing to the uncertainty of the breeding of all Angora goats prior to their importation to this country, is a very improper name at the best, and should be substituted by "thoroughbred" or "highbred") is not sufficient, as there are a great many Angoras going under that name, which are nothing better than grades of worthless breeding, though really descendants of imported stock. These goats, of course, are entirely useless if quality breeding is the purpose. The only animals from which you can reasonably expect to raise fine stock must be thickly covered with mohair from the face to the tail, and with nothing but mohair, without any admixture of coarse lusterless hair on the top of the neck, on the back and on the thighs. Such animals should not have bare throats or shoulders, and even their legs should be well covered. The denser, longer and finer the mohair, the better the animal. These, however, are not the only requirements for Angoras, but the above-mentioned qualities should have been inbred for generations, and the more ancient the generations of *uninterrupted high breeding* the more valuable is the animal as a stock getter, for "like begets like or the like of ancestors."

The less a farmer or stockman knows himself how and where to buy good breeding stock, the more particular he must be from whom he buys. To substantiate this I will mention three cases, which are very apt to illustrate how easily one may be misled in buying.

Some years ago a prominent Angora breeder sold to a Western man 100 head of Angora goats at, I am told, $40 each. As the price shows, they were not the pick of his flock but the culls; but they were undoubtedly the descendants of imported stock. After their arrival, and after the freight had been paid, they were, for some reason or other, resold, and I was informed they brought only $35 each, except four or five picked "billies," which were sold at $50. I have seen these goats repeatedly, but about half of them had bare throats and a good number even showed bare shoulders. Altogether the lot shows variable breeding, and some do not look any better than a third cross of a first-class Angora "billy" on a smooth-coated common goat.

Last summer I was sent by a party in Texas to a gentleman in Pennsylvania to examine a few goats offered by him for sale at from $60 to $150. The only good animal in the entire lot was a three-year-old buck, which the owner had bought about a year or two prior to my visit. He was the $150 animal. All the rest had bare throats and showed signs of variable and careless breeding. Except the above-mentioned buck, whose real value was not above $75, I would not have paid $8 per head all round for the entire lot. The owner knew fully well that I was perfectly acquainted with goat prices, and that I knew also how a fine goat ought to look. Altogether, I could plainly see in his face that he considered his goats first-class and that he felt disappointed at my not getting in a fever heat over their *fine points!* He honestly thought the above-mentioned figures cheap for his goats.

I was informed by an acquaintance that a gentleman in Rochester had three Angoras for sale at $100 each. I wrote to him about them, but mentioned in my letter that the price he asked was entirely too high for any goat, except for an uncommonly fine animal; however, that if he would offer them reasonably, I might buy them. Now let me quote from his letter: "I am willing to sell them reasonably, because I am not in the business. I have as fine a buck as you can find in the country. His brother sold last year for $100. He is a beauty. I cannot tell the weight of their wool. I keep them at a farmer's 20 miles from here. There is one very pretty two-year-old milk goat, the buck above referred to, and one handsome wether. If you will give me $100 for the three I will pay all expense of boxing and shipping."

I asked what breed they were. He sent me the letter from the party in Kentucky he bought them from; it read as follows:

"The buck which served all of goats was pure blood, a part of the ewes were full blood and a part seven-eighths, none less than seven-eighths, etc." So all of them were *grades*, and low ones at that, and $20 would have been a big—even a very big price for the entire lot.

The above-mentioned three transactions were all without any intention to misrepresent facts, the owners acting in good faith, but if they can lead to such poor results, the reader can imagine what mischief can be done when stock is intentionally misrepresented! All these cases show how careful a purchaser must be in order to get the worth of his money.

Thus, if you own a small place, take the best class of goats. Rather take only three or four prime animals than 20 or 30 poor ones, which only are worth what their hair and flesh bring in the market. You must be sure that the get of your stock will reproduce well, so that you can sell the offspring at a fair price and be sure they give satisfaction to your purchasers.

A party owning a large territory, suited to goat husbandry, is in a different position. If he does not want to risk too much in the start, it may pay him better to buy grades, according to their quality, at $3, $5 or $8 or more, and buy a large number, and, by careful breeding, breed them up to the thoroughbred standard. But also he should be careful as to what he gets for his money, and carefully avoid the offsprings of the *long and coarse-haired*, shaggy-looking common goat, whose fleeces are full of useless coarse hair, which depreciates the value of their fleeces. This coarse hair is mainly visible along the back and rear part of the thighs of the animals. These coarse hairs are easily introduced in a flock, but very hard to get rid of. It is by far a quicker way and a more thankful task to grade up a smooth-coated common goat to the thoroughbred standard than a thickly-fleeced grade, of fourth or fifth cross, but with plenty of coarse hair in the fleece.

If you have to select common nannies and want to grade them up, select nothing but the short-haired, slick-looking common ewes. The shorter, glossier and finer their hair, the better the animals for that purpose. But avoid like the plague the shaggy-looking long and coarse haired goats. You can just as well expect to produce pure standard mohair on back of the get of a porcupine or hedgehog as on the descendants of any of these coarse-haired goats.

If a ranchman can afford to keep thoroughbred Angoras on a large scale, he should do so. They are always more profitable than common goats, but only if they are the right kind of goats—that is, the very best. But especially in northern latitudes, where wintering stock is rather expensive, highbred animals should be preferred.

Bucks.

Now last, but not least, I will say a few words about bucks. They are to a flock what a general is to an army. As it is impossible for a good army to fight a fine battle under the command of a poor general, so it is impossible to attain good results, even with the best of ewes, if they are served by poor bucks. In purchasing these latter, do not spare trouble nor expense. There is no doubt that the only reason why Angoras have not been considered hitherto with more favor in the United States is to be found in the carelessness with which breeding stock, but especially bucks, have hitherto usually been selected, as well as in the fact that most breeders do not even know how a really first-class animal should look. I therefore will describe as closely as I can the points which a first-class Angora should have:

The body of an Angora goat should be long and as round as possible, though it is not as round as that of a sheep. The back should be straight, so that hip and shoulder are about equally high from the ground; shoulders and quarters heavy and fleshy, and the chest broad, indicating good constitution. The legs should be short and strong. The head is in shape like that of a common goat, but less coarse and cleaner cut. The horns are heavy, of spiral-like shape, inclining backward and a little to the outside.

Except just the face and the legs, from the hocks and knees down, the entire animal should be densely covered with mohair, and neither the belly nor the throat and chest should be bare, and the denser, finer in fiber and longer in staple the mohair, the more valuable the animal. Buck fleeces of the finest fiber should weigh, when the animal is at its best (that is, when four years old), five pounds, but never less than four and a half pounds. Coarse-haired animals should clip seven or eight pounds and better. The hair should hang on the animal in ringlets, and should not be shorter than nine inches, but with very fine goats it very often reaches 12 inches, and sometimes it is even longer and fairly sweeps the ground. The greater the length and density of the hair the better. Seen from a distance, the body of a well-fleeced Angora goat should appear like an oblong rightangled square.

Ewes are somewhat finer and shorter in fleece, comparatively lower at the shoulders, heavier quartered and narrower chested than males. Their horns are short and very thin, and curved backward. No good ewe should shear less than 3 pounds at a clip when 4 years old, and coarse-haired ewes from 4 pounds upward.

For grading up common goats and low grades, a coarse-haired, heavy-fleeced buck gives the best results; but afterward a finer fleeced animal should be used.

As exterminators of brush, goats have no equal, and as their droppings are fully as good as those of sheep, they are no doubt the most valuable of the two in brushy localities; but when it can be done, they should be kept together in the same pasture. However, do not forget that only the best kind of a wire or lumber fence will keep a goat!

Ridgewood, N. J.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Peach Knot Discussed by Newcastle Grange.

EDITORS PRESS:—As you requested, I will let you know the result of our Grange deliberation on the "Peach Knot." A letter on the subject from Mr. Wickson, lecturer on agriculture at the State University, also the report of Mr. W. B. West to the State Horticultural Society, were read. A general discussion followed. Our opinions were varied; no one knew the cause, nor had ever tried a remedy. All that had ever been done was to take up the knotty tree and substitute a new one. Some thought we cultivated too much around the tree—too deep. Others thought that most always the trees would get their water during the middle and latter part of the day, when the ground was hot, and the tree right at the top of the ground got scalded, and sometimes the roots. It was thought also that trees planted on ground where the live oak and black oak grew, or had grown, took the knots from the old roots of the oak, as it was claimed that the oaks named had knots on their roots similar to the peach.

Another opinion was as follows: The peach tree under favorable conditions makes a large growth of top during the season. I can show prunings 12 or 14 feet—one season's growth. When fall comes, the sap going back into the roots does not find room, but makes it for itself in creating these knots—that is, it boils over. The next season, instead of the sap all going up the tree again, goes to developing the knot; the tree is less thrifty. The downward flow of the sap finds room in the knots and roots, but not enough to properly fill the knot, and so the knot begins to decay, as in all the roots I took up the knots showed more or less decay. Sometimes the tree will beat the knot. We have one tree (there may be more) where, in spite of the knot, the tree shows thrift. In this instance the knot is at the surface of the ground. The knot at the top of the ground occurs quite often, but the worst one we ever saw was where no indication of the knot showed itself except in the appearance of the tree. The root was simply a great egg-shaped ball, with a few roots 8 or 10 inches long running from it, and it showed no signs of decay. The tree was three years from the bud. Last year it did not make two inches of growth.

We are going to look into the matter further, and we will let you know what we find. Some trees I have dug around, chopped off the knot, sprinkled a little salt around, put fresh dirt in the hole, and am waiting to see the result. Those trees are in blossom and show no signs of being much disturbed.

The Grange (Newcastle, No. 241) wished me to extend its thanks to Mr. Wickson for the kind attention given to their request for information on the disease. S. AUSTIN WOOD.

Penryn, Placer Co.

Stockton and Lodi Granges.

EDITORS PRESS:—Stockton Grange has been considering the franchise for women, but means to take plenty of time on a question affecting the unity of the Order and widening her power for good or evil. Some honestly think it would ruin home life; others, that only bold tricksters would go to the polls; others favor a restricted, educational, property franchise for both sexes; and others believe in pushing it in the State and National Grange, even if members left—citing the "Emancipation Act."

I visited Lodi Grange on the 16th, when this question was earnestly argued in its scope and dignity, and continued to the next meeting. One level-headed brother didn't want men talked up as idlers, tippling away the family income and oppressing womanhood. Women could get laws altered without going to the polls. Women lied and cheated and would elbow up to vote for a rascal, just the same as men, while all good women staid at home.

Crops are later around Lodi, but hold out late. Fruit is promising. MRS. W. D. A.

The Gridley Monument.

A great picnic in aid of the Gridley monument fund, under the joint management of the San Joaquin Pioneers, the G. A. R. and the P. of H., is likely to be held at Good Water Grove some time in April or May. The Stockton Street Railroad Company has offered the use of the grove for the purpose, and all the organizations mentioned appear to be stirring in the matter.

The Stockton *Independent* states that the foundation of the monument has been laid in the Rural cemetery, on a lot donated by the directors to the G. A. R., and to which the remains of the patriot are to be removed. A marble statue of Gridley, to surmount the monument, is being chiseled in Italy. One statue had been finished, but was broken in the packing, and the sculptor is now at work on another. It is hoped that it will arrive and be ready for unveiling in Rural cemetery on Decoration Day, May 30th.

Facts for the People to Note.

The names of the commissioners who are to investigate the Pacific railroads have not been made public at the date of our writing, but their publication is looked for daily, and it is probable that ere our readers see this paper the appointments will have been announced by President Cleveland.

As foreshadowing to some extent the work of the commission, it is well to note some points in a report of the House Committee on Appropriations (telegraphed from Washington some weeks ago) respecting their refusal to make an appropriation to pay the C. P. R. Co. for carrying the mails and for other transportation. We quote:

"In this connection the committee would state that the United States owes the Central Pacific Railroad Company various sums of money for transportation under the War and Postoffice Departments, aggregating in round numbers $2,000,000 or more. The agents and attorneys of that company, with great persistency and activity, have sought to convince the committee that appropriations should be made for the payment of this indebtedness in money, notwithstanding the admitted fact that the railroad company is justly indebted to the United States in the sum of more than $60,000,000. The committee were of the opinion that equity and justice required that the company should be entirely satisfied to have the amount of these claims placed to its credit as a partial payment of or set-off to that much of its vast indebtedness to the United States.

"The committee was answered by the agents and attorneys before alluded to that the debt of the company to the Government was not yet due and would not be for eight or ten years yet to come; that a test case has been made and tried in the Court of Claims and on appeal in the Supreme Court of the United States, and that those tribunals had each decided that the company was entitled to the payment of these claims regardless of its indebtedness of $60,000,000, as before mentioned, and that the indebtedness of which payment was asked accrued to the company by reason of its performing the service out of which the claims originate over branch lines not subsidized or aided by the grant either of bonds or lands, but leased, controlled and operated by the company.

"It should be observed, however, in this connection that the accounts are presented in the name of the Central Pacific Railroad Company; that the indebtedness and the audit are to that company; that the test suit was in the name of and by that company; that the judgment was rendered in its favor and that the services were rendered by it; but in rendering such services the company used its leased lines. Therefore, if there was ever a man or corporation under obligations to keep faith with the Government and the people of the United States, the Central Pacific Railroad Company and those who have control of the vast wealth and power conferred upon them by the legislation of 1862 and 1864, were, and are, bound by every consideration of justice, honor and gratitude, to keep absolute, perfect and unlimited good faith with such government and the people.

"Under the legislation alluded to, it cannot be too frequently stated or too earnestly considered that the Central Pacific Railroad Company received from the Government immense privileges, bounties and subsidies. Among other things, first, a natural legal status; second, a grant of the right of way of 404½ feet in width; third, earth, stone, timber and other material of construction from adjacent public lands; fourth, alternate sections of the public lands on each side of the road for a depth of 10 miles, and in order that the company might have the choice of land, it was allowed to the extent of 20 miles on either side from which to select the quantity indicated; fifth, on 17.18 miles of the road, the Government loaned it $16,000 per mile, on 150 miles the Government loaned it $48,000 per mile, on 580 miles the Government loaned $32,000 per mile, all in 6 per cent 30-year bonds; sixth, the bonds of the company issued in 1865, 1866, 1867, 1868, 1869, and made a lien prior to the bonds of the Government lent to the company and aggregating $27,852,000 with 30 years to run at six per cent gold interest; seventh, the capital stock issued by authority of law, but required to be paid up in cash and in full $59,275,500.

"We have a right to assume that the land produced revenues equivalent to the $32,000 per mile, an amount amply sufficient to complete the road; that the bonds the Government lent to the corporation, and averaging over $35,000 per mile, were more than sufficient to complete and equip the road; that the second mortgage bonds allowed to be made a first lien as against the bonds of the Government so lent were sufficient to complete the road, and that the stock required by law to be paid up in full was more than double the amount required to build the road.

"Thus this corporation secured, through the confidence and bounty of the Government, a sum of money sufficient to build and complete five roads of the same length. Where is all this money?

"Will it be seriously denied that this money, the money of the people and their Government, formed the basis of the great fortunes made by the recipients of all this bounty, and also defrayed the cost of building all the branch roads, which were claimed to have been leased only by the Central Pacific Railroad Company? When to these vast sums we add, practically, the net earnings of the road for 20 years in which the Government has an interest by law, we recognize the sources from which came the money to build all the roads ever operated or leased by the Central Pacific Railroad Company. In this estate the Government had and has a sovereign interest, subject only to rights of honest creditors, to whom the Government has given prior rights."

After referring at some length to the alleged test-case, in which judgment for the company was allowed to be entered in the Court of Claims, and showing how slender are the conclusions that can be drawn therefrom, the report proceeds:

"It would seem that the road of the corporation enriched by the legislation of 1862 and 1864, and in which the Government has such a large interest, together with all its leased or operated lines, is now or was recently in the possession or control of a corporation created by a special Act of the Legislature of the Commonwealth of Kentucky and called the 'Southern Pacific Company,' as lessee, on a lease or leases for 99 years.

"As the Government employs a number of representatives of the United States in the directory of the company, we may at their convenience get a history of the wanderings of a fugitive debtor to the United States, which, when last heard from had taken temporary refuge, at least, under a new but pacific name within a State somewhat distant from its theater of operations. The Southern Pacific Company, of Kentucky, must be, as lessee, receiving the earnings of its leased lines. Has not the Government such an interest in this property as would justify a strong interference by the proper Government officials?"

In connection with the proposed appropriation of $150,000 for army transportation, the following proviso was inserted by the committee:

Provided, That no part of this sum shall be used for the payment for transportation over any line or lines owned, leased or operated by the Southern Pacific Company, a corporation created by the laws of the State of Kentucky.

March Grange Organized at West Butte.

The *Sutter Farmer* of last week tells in lively style how a new Grange was instituted on the 19th of March. We give in condensed form the substance of the pleasing story:

Last Saturday was a day that will long be remembered by a large circle of visitors to a certain prosperous little hamlet near the western boundary of our county. The vicinity of West Butte contains a population nowhere excelled in intelligence, sociability, industry and prosperity. The farms are small and well cultivated; the surroundings betoken thrift, taste, neatness and comfort, and the Grange spirit is so clearly manifest on every side that the only wonder is it had not sooner organized itself in living form.

At last County Lecturer Frisbie was notified to come and set the wheels in motion; and he in turn invited W. S. M., Johnston, and W. S. L., Flint, but neither could come, owing to previous engagements; hence the work devolved upon local talent. North Butte Grange was represented by R. K., Mrs. and the Misses Stevenson and Mr. and Mrs. H. S. Graves; Grand Island Grange, by W. M., J. R. Tottman and wife; Yuba City Grange, by Mr. and Mrs. and Earl Frisbie, Mr. and Mrs. B. F. Walton, W. M., C. E. Williams and Mrs. Williams, Mr. and Mrs. C. C. Newkom, Harry Walton, Mr. and Mrs. Sammish, W. J. Hardy, George Ohleyer, Jr., Miss Newkom, Mrs. Kline, Willard Woodworth, and George Ohleyer and wife.

The assembly was called to order by Duputy Frisbie, who filled the offices temporarily with Grange members, after which 26 persons came forward and signed the roll as charter members, a few being absent, owing to high water in Butte slough. The applicants having been duly accepted and instructed, all were invited to and partook of one of the most sumptuous Harvest Feasts it has ever been our good fortune to attend—and the good sisters called it a "lunch."

The feast over, the officers were elected and installed, and the new Grange was named "March Grange," in pursuance of the suggestion of Mrs. W. W. Wilbur. The name is significant—first, as denoting the month of its organization; second, the pleasant springtime; and third, progress, or forward, *March!*

Several visitors were then called on for remarks, which, owing to the approach of evening, were short, and after a general farewell hand-shaking, the assemblage dispersed to their homes, well pleased with the fraternal meeting, and all wishing the new Grange unbounded success.

Following are the officers elected to serve the present year: C. C. Patridge, M.; W. W. Wilbur, O.; Mrs. E. C. Reynolds, L.; W. F. Hoke, S.; J. C. Porter, A. S.; Mrs. W. W. Wilbur, C.; E. A. Noyes, T.; Mrs. S. I. Noyes, Sec.; W. W. Reynolds, G. K.; Mrs. Mary Patridge, P.; Miss Addie Porter, Flora; Miss Nannie Stevenson, Ceres; Mrs. M. L. Porter, L. A. S.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

Now that Congress has adjourned, and members of the Grange are feeling well over the passage of measures in the interest of agriculture, some of which we have been advocating and working for many years, let us not forget our plain duty of saying, "Thank you!" to those who were our friends, and by voice and vote proved themselves true *representatives* of the great class whence came, in most instances, the majority of the votes that placed them "in the front." We pass our resolutions, adopt our reports, forward our petitions and memorials, "demand" the passage of certain bills, because they are right; we censure and blame those who forget us; but do we *always* give credit where credit is due? During the last session of Congress some brave men had frequently to dare party displeasure, or, perhaps, equally as serious a matter for them, incur the enmity of corporations that will be used *against* them in a future nominating convention or a canvass for re-election. So let us at least thank them personally or by letter; show that we can praise as well as blame, and that the one will help as the other will hurt their prospects. This is one more way of proving the power of our organized efforts.

While we are thanking our representatives in legislative halls, let us also not forget our other able allies—the favorable press. Some so-called agricultural papers hardly ever mention the Grange; others, and their numbers are increasing, are ever willing to lend the helping hand in all our honest efforts to hasten the good time coming. Let us thank *them*, also, and show our appreciation of their help not only in words but by a hearty support, and aid in extending their circulation. While for those who slight our great Order, or slyly ridicule our work—well, let us quietly drop them from our list of papers. "Cling to those who cling to you." In this way the power of organized effort can also be shown and *felt*.

"In the past the farmers as a class have generally been content to remain totally disorganized, and instead of uniting to press upon the attention of the National Government any special interests of their own, they have been willing to trust to Congress to enact such laws as would be fair alike to all. The inexorable logic of events, however, has demonstrated to them that they have been too trustful, and that they are now at great disadvantage before the laws, and that a great effort will be required to regain their lost ground. They are learning, too, that to be effective their great numbers must pull together. This can be done only by organization."—*Senator Jones, Arkansas, in U. S. Senate.*

"What agriculture needs is a repeal of those laws which have dethroned her from the imperial position which God gave her and which she ought to occupy in this land to-day."—*A Voice in the House of Representatives, February, 1887.*

"This practice of creating securities in excess of actual value has, by one method or another, imposed on investors a volume of fictitious stocks and bonds more than double the amount of the National debt. According to the estimate of the most widely acknowledged statistical authority upon railways, through the methods of sale or hypothecation, $3,720,000,000 of puny paper values ('watered stock') have been sold to the public."—*J. F. Hudson.* Is it any wonder we are creating millionaires so rapidly? This "watered stock" alone, at $1,000,000 each, would make *three thousand seven hundred and twenty millionaires.* And they do "make" money so easy—out of white paper and printers' ink—then the people are taxed in freight and passenger rates to pay dividends on this "paper money."

"Farmers' organizations are a necessity; in order to meet successfully organized power, the farmers must form thorough organizations among themselves, and there is no national and complete organization except the Grange; it must be either this or nothing, and farmers themselves must decide the question; it has no middle ground, simply two sides from which to choose; one is to unite in organization and co-operative work in self-defense and protection, and the other is to keep aloof from organization, which virtually acknowledges that we are incapable of self-government, and therefore prefer masters to control us, and accept whatever they may see fit to leave us."—*Henry Eshbaugh, Past Lecturer National Grange.*

Suggestion for the Good of the Order.

"During the first years of our organization we built a fine hall in which to hold our meetings, and by that means, as we believe, perpetuated our organization, and we are now reaping the reward of our forethought. We are determined to keep the Grange in good running order, and hand it down to future generations. Have Grange homes. The W. S. L. of California, Daniel Flint, when with us said: 'Patrons, build yourselves halls. Don't be ashamed of your Grange homes, but paint in bold letters your Grange name, number and date of organization.' Everybody and everything, even a bird, can and will work with more love, energy and hope, if it is a home they are building up and beautifying."—*I. L. H., Oregon.*

Progress.

March 11th, State Master J. H. Hale, of Connecticut, organized a new Grange at Mansfield. Among the members were the professors and teachers and young men of the Storrs Agricultural school.

The Oxford County P. of H. Mutual Fire Insurance Company has 666 policies. Amount insured, $667,482. Paid for fires, 1886, $3058.95. Actual cost for insurance for past ten years on $1000 has been $10, or $1 per year.

"The Grange is growing in power every day in this State."—*E. C., New Hampshire.*

Cataula Grange, Georgia, by co-operation with State Grange in purchase of fertilizers for spring crops, saved 12½ per cent ($250) on a bill of $2000.

A carefully planned and conducted campaign is now being carried out in Colorado for a revival and extension of Grange work by Worthy Master Levi Booth and a corps of earnest helpers.

Georgia and Texas are showing the most life and push in Grange work just now of any of the States south of Mason and Dixon's line. But without exception the State Masters "down South"

are writing of encouraging signs of renewed interest, and the future is brightening all along our lines.

"So let it be. In God's own might
We gird us for the coming fight,
And strong in Him whose cause is ours,
In conflict with unholy powers,
We grasp the weapons He has given—
The light and truth and love of heaven."
—*Whittier.*

Officers Installed.

LINCOLN GRANGE installed the following officers March 19: Hollis Newton, M.; J. S. Philbuck, O.; O. Clark, L.; G. Jobe, S.; P. Ahart, A. S.; Rebecca Keaton, C.; Mrs. Hollis Newton, T.; A. J. Soule, Sec.; L. N. Scott, G. K.; Mrs. N. A. Scott, P.; Mrs. E. M. Crook, F.; Mrs. W. P. Ahart, Ceres; Lulu Allen, L. A. S.

PILOT HILL GRANGE.—Jan. 7, 1887: N. Wentworth, M.; C. Rogers, O.; F. Lovejoy, L.; S. Lovejoy, S.; J. Johnson, A. S.; J. W. Davis, C.; J. P. Bayley, T.; A. J. Sumpter, Sec.; J. W. Young, G. K.; A. Dobbat, L. A. S.; Mrs. C. G. Lovejoy, P.; N. Wentworth, F.; A. J. Bayley, Ceres.

PLYMOUTH GRANGE.—March 12: J. F. Gregg, M.; J. Sallee, O.; Mrs. Worley, L.; J. G. Aden, S.; B. Jelmini, A. S.; Mrs. Wheeler, C.; Eleanor Easton, T.; Clara Sallee, Sec.; E. S. Potter, G. K.; Linda Moore, P.; Belle Paul, F.; Ella Wheeler, Ceres; Mrs. S. J. Salee, L. A. S.

Danville Picnic, May 7th.

Patrons will look forward with pleasant anticipations to the Grange picnic for Contra Costa, Alameda and Solano counties, which is to be held at Danville, Saturday, May 7th. A large attendance is desired. The committee are encouraged to expect an address, among others, from one of the best orators of the Pacific Coast, and the aim is to make the day one of great profit and enjoyment, both mentally and socially. Full notice will be given of the arrangements, when perfected.

MAKE FARM-LIFE WINSOME.—Young people naturally crave more or less excitement and pleasure, and generally find a way to gratify their taste in this respect. Now, just in proportion as you make the home-life and harmless amusements attractive, and encourage a taste for pure reading, etc., thereby making life on a farm consist of pleasure and intelligence as well as toil, we shall hear less of the cry that our young men are drifting to the overcrowded cities, and that very few are willing to farm in these days—an evil which needs careful consideration and earnest work to counteract its baneful influence. In these young people, more than any other class, lies the future of our Nation. Which shall it be, a Government to which we can point with pride, and say to it, and those statesmen, behold some of the work of the Grange? or shall we have to blush for its ignorance and shame? The latter will never be the case if the Grange continues to prosper and diffuse its educational principles and literary advantages among the agriculturists of our country.—*Fannie E. Thoman, in Farmers' Friend.*

FARMERS ORGANIZING.—The Walla Walla *Union* reports the organizing of a Farmers' Protective Association there, March 12th, with the following officers: President, W. S. Gill am; Vice-President, F. M. Louden; Secretary, F. T. Gilbert; Treasurer, Orley Hull, who were directed to draft a constitution and by-laws, and call a special meeting of the society to act on the same. An executive committee of 11 was also chosen. The Secretary was instructed to request farmers in other localities to organize local assemblies. Speeches were made by eight or ten of those in attendance, showing the necessity of organizing for protection, and when a rising vote was taken to ascertain who would join such a movement, all present signified their willingness to participate.

SAN JOSE GRANGE last week conferred the fourth degree upon a class of four. After the secret work in the lodge-room, a company numbering about three-score sat down to an informal dinner in the adjoining hall. When the viands were disposed of, Mrs. S. P. Saunders welcomed the new members; E. T. Pettit read Emerson's essay on "Friendship;" Hon. I. A. Willcox made an entertaining speech about "Grangers;" a reading was given by S. P. Saunders; and songs were sung by the Messrs. Webb and Miss Lizzie Webb. A local reporter says: "The Harvest Feast was greatly enjoyed by all present, and those of the company who were not Grangers wished they were."

A CONTRACT has been let to parties to make 6,000,000 brick for the use of the Southern Pacific Railroad Co. The parties who received the contract have bought land just north of Anderson, Shasta county, and have put men to work cleaning it of timber, preparatory to commencing operations immediately. The company intends to run a side track into the yard.

"BETTER AND BETTER."—A regular reader in Monterey county incloses a dime to us, saying: "Please send me another copy or two of the last RURAL PRESS. I like it better and better, and those to whom I send it at the East are equally well pleased with it."

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

NEW ORCHARDS.—Livermore *Herald*, March 24: J. D. Smith finished planting the Hatch and Robertson orchards yesterday. The Robertson planting was 32 acres—17 of almonds and 15 of Bartlett pears. Mr. Hatch planted 30 acres on his purchase in the Oak Spring tract, and 34 on the Daugherty place. The latter planting was done in two days by 20 men—staking, hole-digging and planting. The 64 acres were planted from Friday noon to Wednesday night. The work was well done, and with another inch of rain, the trees will make a good growth this season.

HOW HE PLANTS ALMONDS.—A. T. Hatch, the veteran fruit-grower, on his planting of 60 acres of almonds in this valley, is cutting off the entire top to within a foot or 14 inches of the ground. The pruner is instructed to leave the top bud on the west side of the tree, and slant his cut toward the east.

Calaveras.

MORE GOOD COWS WANTED.—San Andreas *Prospect:* Ranchers in this immediate vicinity have the very poorest kind of milch cows. There are a few very good cows, but they are owned by parties who pay no attention to the raising of stock; they simply keep the cows for milk and butter for family use. W. J. Adams, who recently bought the Table Mountain ranch, near Murphys, we are informed, has some of the finest cows in the county. They are thoroughbred Jerseys. There is no question that the Jersey cattle will do better in the mountains than almost any other breed.

Contra Costa.

WATERMELONS.—Martinez *Gazette:* Last summer Philip Wells, of Pacheco, sold over $300 worth of watermelons from one acre of land. Melons in this county remain on the vine until late in the fall, several crops being borne.

OLIVES.—Although there are no extensive olive orchards, there are trees growing in nearly every section of the county. H. M. Gregory, of Ygnacio valley, has an olive tree that bears heavily every year. John Garcia, of Concord, has three trees 12 years old, from which he gathered 750 pounds of olives this season. The impression that the olive tree will not bear until ten years of age is erroneous. Trees on the farm of James Hook, of Pacheco, bore a few olives the second year after planting, and averaged 30 pounds to the tree the third year. Mr. Hook is making oil out of his olives.

Fresno.

BOUND TO HAVE WATER.—Selma *Irrigator:* Last Monday the directors of the C. and K. canal noticed water running in their canal, and ordered Supt. Shaffer to go and shut it off. With John Stroud he went to the head gate and undertook to close it. When he touched the gate a man arose from the bushes near by. He had a barley sack over his head with eye-holes cut in it, and carried a formidable-looking shotgun, which was pointed directly at Shaffer. "You let that gate alone," was the first salute. Shaffer informed him that he was the superintendent of the canal, and had been ordered by the courts to shut the gates. The man in the sack spoke again, saying: "I don't propose to argue the question with you. You let that gate alone and get out of here." His finger was on the trigger of the gun, and as the argument presented was decidedly forcible, Shaffer decided to get. A meeting of the board was held, and an affidavit sworn to by Shaffer and forwarded to Judge Cross at Visalia, to show that the board had done what they could to shut off the water and protect them from fine. The water is still running in the ditch, and those using it are making up for lost time. Everybody is irrigating.

Inyo.

ORNAMENTS FOR OWENS VALLEY.—*Inyo Independent:* At the residence of A. N. Bell, at Camp Independence, are some very fine Italian cypress trees. The trees are heavily loaded with seed bolls, and Mr. Bell will supply all that may be wanted, free of cost, to any who may call at his place and gather them. He has a number of young trees growing from the seed. The Italian cypress is a handsome evergreen and grows rapidly at his place. No doubt it would do the same all over the valley.

Lassen.

FOUR CALVES IN THIRTEEN MONTHS.—Chico *Enterprise:* John Blunk, of Honey Lake, has a cow that on the 29th of January, 1886, gave birth to twin calves, male and female. Feb. 8, 1887, the same cow gave birth to twin calves—both females. Mr. Blunk says that if the District Fair is held at Susanville this fall he will place this cow and her family on exhibition, and see if any stockraiser of the northern country can beat them.

Marin.

RAVAGES OF HOG CHOLERA.—Telegram from Petaluma, March 26: Over 4500 head of hogs have died of cholera near Point Reyes since the disease was imported from S. F. a few weeks back. Many also have died in other parts of Marin county touched by the same drove of hogs. One ranch on which they stopped an hour lost 60 head. Another ranch lost 90 head, all the rancher had, and many others this side of Point Reyes have been heavy losers. In fact, everywhere the drove went they spread the infection, and parties acquainted with the disease say it will be a long time before it is finally eradicated.

Los Angeles.

MANURING ORANGE TREES.—Santa Ana *Standard:* We went through W. Z. Cook's beautiful little orange orchard this week. As an orchardist, he is one of the most thorough in the valley and does everything well. He showed us two Navel trees set out the same day five years ago. One was thoroughly manured, the other was not. The manured one is five times as large as the other, yet both had equal cultivation.

Monterey.

AUGMENTING ORCHARDS.—Salinas *Index:* At Carneros M. Nicholson has been adding 25 acres to his orchard; M. D. Murphy has added several to his, mainly apricots; J. B. Hickman has set out about 150 trees; J. S. Rowe, J. M. White and others have made slight additions to their orchards. In a few years the valley will have more than enough fruit for its own use.

San Benito.

SWARMING SQUIRRELS.—Hollister *Advance:* The land along the railroad track in this county is honeycombed with squirrel holes, and there the pests breed in large numbers. Anywhere near the railroad the squirrels can be seen coming in from the fields, their stomachs filled with seed wheat which they have scratched up. While the farmers all around are spreading poison in their fields, no doubt, if the matter was properly presented to the railroad authorities, they would instruct their section hands to aid in exterminating the rodents.

San Mateo.

COUNTY'S CAPABILITIES.—*Times & Gaz.:* In the village of San Mateo excellent oranges have been grown for many years past—enough to show what might be done in the sheltered foothills. The banana grows in the open air on the grounds of Mrs. Bowie. A plant of it fruited there a year or two since. Date palms grow here. The olive has proven a rapid and thrifty grower. Figs, in suitable situations, grow luxuriantly and produce abundantly. Bartlett pears are a valley product of unsurpassed excellence. The vintage of Portala valley has already attracted appreciative attention.

Santa Barbara.

EDITORS PRESS:—The Santa Barbara boom grows bigger and bigger every day, every hour. Will it ever burst? I begin to surmise it never will, but that it will grow inwardly as well as outwardly, until it becomes one solid lump of goodness. Well, why not? We have the best climate in the world, some of the best people in the world, as charming and romantic scenery as can be found in the world; and if we charge new-comers prices big as any other prices in the world for some of our houses and lots, and other good things, who shall say us nay? Some of our crops are sadly in need of a little more rain, and if April showers do not come to help us out, there will be quite a shortage. But the fruit prospect is, so far as my experience goes, unprecedented.—S. P. SNOW, *March 25th.*

SCORPION VERSUS CROW.—Lompoc *Record:* While W. J. Robinson was plowing recently he turned up a scorpion which was seized and borne off by one of a greedy flock of crows that was following the plow. Soon there was a great commotion among them, and he saw the one that had carried off the scorpion lying upon the ground. On examining it he found that the insect held in the beak of the bird had stung it under the eye, causing almost instant death.

Santa Clara.

BANANA PLANTATIONS IN EMBRYO.—*Call*, March 24: About a year ago a lady who lived for many years in the Hawaiian islands, but is now settled in the foothills about 2½ miles from Los Gatos, noticing that the climate was similar to that of her island home, sent down for a quantity of banana plants and set them out as an experiment. They have thriven remarkably well, and give every prospect of bearing an abundant crop of the luscious fruit during the coming season. Captain Lucky, of the Pacific Towboat Company, who has a ranch in the same neighborhood, has sent to the islands for a large number of the plants.

Shasta.

HOPS.—*Courier*, March 19: Dr. Mooers has a fine hop field near Burgettville, and derives a handsome income from it. We have often wondered why hops were not extensively cultivated in this county. There are thousands of acres of land on Cottonwood, Stillwater, the numerous creeks in the Millville country and many other places, where hops would grow in great profusion and no danger of the crop ever failing.

Solano.

VACAVILLE NOTES.—EDITORS PRESS: The weather is very pleasant, though threatening rain. The ground that has not been plowed is getting very dry. People generally have the first plowing done. Ground is very rough—more so than common. Nearly all kinds of fruit trees are loaded with blossoms. This does not insure a crop of fruit, but it is a good start, for without blossoms there could certainly be no fruit. There has not been a great deal of new orchard and vineyard put out this year. From 30 to 50 acres of vines and from 75 to 100 acres of trees will cover what has been put out in Vaca and Pleasant valleys. There have been several hundred acres put out in the vicinity of Winters. Messrs. Amoore & Gorman have started a Japanese nursery in the Gates canyon, four miles west of Vacaville. Grapevines are starting very finely; sprouts two or three inches long are on many vines. Several commission men have already been around. It is early for them, as they usually do not come before the middle of April. The box men are also on hand. One was at Vacaville last week, with cherry-boxes with slats on the sides, and a partition in the middle of the box and warranted to hold ten pounds, for which he asked 3½ cents apiece.—G., *Vacaville.*

A NEW ALMOND.—Davisville Cor. Dixon *Tribune:* W. F. Treat has discovered in his orchard a new seedling almond. The tree is eight years old and a constant bearer, never having failed to bear a full crop for five years past. The nut is somewhat longer than the Languedoc, ripens four weeks earlier and drops from the hull when mature. The tree is no way favored, as it stands in the middle of an almond orchard, the trees of which are 20 feet apart.

Sonoma.

AN ENORMOUS EAGLE.—S. Rosa *Republican:* Price Brown, an employe of E. W. Davis in Yulupa Valley, lately killed one of the largest bald eagles ever seen in this part of the country. The bird measured 78½ inches from tip to tip; its talons were large and strong enough to hold a two-year-old child, and the beak was sharp enough to cut any kind of flesh. Our friend Price gets a bounty of $2.50, and the money is well expended by the Board of Supervisors.

Tulare.

EXPERIENCE IN GROWING RYE.—*Register:* The rye was sown after the rains last year, by H. E. Francis, a few miles southwest of Tipton, getting but one slight sprinkle on it, and with a spring-toothed harrow upon a barley stubble field, without plowing. Notwithstanding this bad farming, it grew to be from six to eight feet high, so that, when cutting it for hay, the driver had to stand up on his machine in order to see the flag set to mark his course across the field. Off 18 to 20 acres 50 tons of hay were cut, and stock seemed to do better upon it than upon barley hay. A few acres were allowed to ripen and were thrashed, and the grain, soaked, made excellent feed. From this it would seem that rye will stand drought better than either barley or wheat, and will yield more hay to the acre under like circumstances.

GYPSUM ON ALKALI.—*Delta:* John Mitchell, of Paige & Mitchell, the large grain-growers, lately purchased several tons of gypsum and sowed it on some spots of land highly impregnated with alkali, which had been thoroughly plowed and prepared for wheat and alfalfa. After sowing the seed, the gypsum was put on at the rate of from 100 to 500 pounds per acre. The result will be anxiously looked for by many who have alkaline patches among their many acres of excellent soil. If it neutralizes the evil effects of the alkali, for both grain and alfalfa, a great good will have been accomplished.

GOOD GRAIN.—The *Register* received, March 21st, some fine specimens of oats and barley pulled from the fields of J. R. Hubbs on Tule river, in the orange belt. The grain was well headed and from five to six feet high. It was sent to Los Angeles, to be placed in Tulare county's exhibit.

CORK OAK.—*Delta*, March 24: One of the finest specimens of the cork-bark oak in the State is growing in Visalia. It was planted about 30 years ago, and is now a large and thrifty tree.

Ventura.

PLANNING FOR A PAVILION.—San Buenaventura *Republican*, March 26: It is proposed to organize a corporation with a capital stock of $7500, for the purchase of a lot with a frontage of 59½ feet on Main street and 170 feet deep, whereon to erect a building, a part of which shall be adapted to the use of the Ventura Development Association for a permanent exhibition of Ventura county resources, and the balance for rental purposes. Back of the building is to be a garden about 59½x50 feet, for the display of trees, shrubs, flowers, etc. The roof is to be of glass. The subscriptions are on condition that so much property can be purchased at not to exceed $80 per front foot, and that the whole amount of capital be subscribed before May first.

NEVADA.

IMPORTING DRAFT-HORSES.—Reno *Gazette:* The Oasis Stock & Land Co. has been incorporated in N. Y. City with a capital of $60,000 and the following officers: Pres. and manager, E. C. Hardy; Sec., H. K. Lyon; Treas., A. E. Kingsbury. Mr. Hardy shipped on March 15th from Normal, Illinois, for Toano, 26 head of fine Norman Percheron and Clyde stallions and mares. He has taken great pains to get a good selection of horses, and thinks they will please the most careful buyers.

SAN LUIS OBISPO PROPERTY.—Parties attracted by the activity in San Luis Obispo real estate and the consequent rapid advancement of the county, should note that the business office of the West Coast Land Company has been removed from San Luis Obispo to Templeton. Mr. C. H. Phillips, who is manager of the company and a pioneer in San Luis Obispo real estate business, evidently believes in keeping his forces at the front, and by moving to the new town of Templeton strikes the incoming tide of settlers who arrive by rail.

A Load of Wood.

To My Friend Upon His Wedding Day.

Accept my offering—a farmer's load—
The gnarled roots of mesquite and of sage,
And boles of mountain oak, torn from the soil
With many a blow of mattock and of ax.

Such uncouth cordwood is in vogue with us
Who dwell upon the mountain-side, where erst
The scrubby chapparal was all the growth
That Nature, in a rugged spirit, gave.

And so, in clearing off my foothills farm,
To plant therein the orange and the vine,
That better grace this sunny clime of ours,
My stock of fuel grew. And I have come,
With wagon clattering down the rugged way,
And I have brought my offering, as the rest,
To grace your wedding feast.

Doubt not, my friend,
That you shall find the fuel sound and good,
Quick to the spark and ready in the blaze,
To boil the pot and make the kettle sing.
'Tis likewise fairly suited to the grate
(Now the long evenings are a little cool),
Yielding its store of sunshine to the room.

For every use
That men require, in reason, of a fire,
I do commend this wood. But know you that,
Beyond the uses here enumerate,
There's magic in it? Wonders like to which
The sorcerers of the East did never work,
Shall it perform for you.

The time is come
When to yourself you take the heart's best choice,
An honored wife. And you have chosen well;
For she, not lacking in the gentle grace
That Nature but bestows on womankind,
Has yet the subtler charm that is vouchsafed
To those alone of true and generous heart.

Enconsced in gown and slippers, sit you down
(Your love beside you), and this magic blaze
Shall send a thrill of rapture through your soul
That kings and emperors have vainly sought.

Anon the simple meal
Her hand prepares above this witching flame
Unto your palate shall approve itself,
Than nectar and ambrosia sweeter far.
Into the embers of this mystic fire
Gaze you, while the night is growing old,
And (still your wife beside you) there shall be
Most wondrous visions to you both revealed.

So, pondering on these things, it seemed most fit
That I, your boyhood's chosen friend, and still
The boon companion of maturer years,
Should your Prometheus be; bringing the fire
To consecrate your home. God bless you, Fred!
God bless your hearthstone! May its flame of joy
Burn on unceasing, like the Aztec fires.

— Wm. A. Spalding, in the Overland Monthly.

The Kitchen Slave.

[Written for the RURAL PRESS by MALLIE STAFFORD.]

I have read from time to time the interesting letters from the wearied army of hopeless toilers on this subject, but forbore to wield my pen on the topic, preferring rather to read and learn, and fearful that I might not be able to impart information that might be of essential help; but after reading the touching story of "A Novice," have decided to enter the ranks and impart some hints which may serve to lighten the labor of some overworked housekeeper.

There are thousands of women to whom thoughts similar to the following are familiar. "There must be something wrong in my general make-up. Why was I not constructed a mere machine, with no thought beyond and above my work, or else why was it not my good fortune to be in a position to exercise my tastes, and follow the bent of my inclination?" Of course there are plenty of men in similar positions, whose occupations are foreign to their tastes; but a man is a more independent being, and can more easily "conquer destiny," so to speak. He can change his business or vocation, but a woman—well, there! Once married, her life, her tastes, her inclinations are swallowed up in her household—there is no evasion, there is no possible change. If through love of a man she accepts his humble circumstances, she becomes in verity and of necessity the kitchen slave; but this kitchen realm is not to every woman forbidding and distasteful. Some there are, if not overworked, take pleasure in making it an artistic study, and it is a branch of the household the most important, inasmuch as good health, and consequently good nature and comfort in the family, depend largely on what we eat and how it is cooked and served, if no other department should demand artistic skill and judgment.

But we were not speaking of those who delight in the kitchen realm, but of those to whom the employment is disagreeable, to whom the handling of black pots, the scrubbing of dirty floors, the endless washing of dishes and scraping of grimy potatoes, is a positive drudgery. There is a fine line, too, between false sentiment on the subject and an honest repulsion to the kind of work. If a woman marries a man in humble circumstances, she knows her lot. She goes into it with her eyes open. If she is a sensible, amiable woman, she will bear and wrestle with kitchen slavery to the end of her days, however foreign to her tastes it may be, and will devise ways and means to lighten it of its heavy burdens; and if the husband is kind and sympathetic, he can do wonders toward smoothing her way. Plenty of wood handy, and plenty of pure water in the kitchen, are a little fortune to one who already has more to do than her strength is equal to. There are many other ways that a man of kind heart and sympathetic nature can contribute to make her labor lighter. Little inventions for this and that are useful, and a little attention and assistance, instead of sitting in the corner evenings and smoking a pipe (more of this subject after awhile), or reclining at ease reading, while the worn-out wife toils relentlessly till bedtime, will be very helpful. With the husband's assistance, and by judicious management in never letting the work run behind, kitchen slavery, even to those to whom it is distasteful, may be shorn of much of its unpleasantness, but never of a certain amount of toil—repulsive toil at that. But as to toil, we all must toil in some way, and why not? In its noble aspects, it is one of the best blessings of the Infinite, and homely toil, no matter how humble, if respectable, may be ennobled by the toiler.

That is the way we kitchen slaves try to reason; it's a good way, too, but no amount of reason can quite obliterate or annihilate our innate loves. No amount even of servile toil can forever blot out that desire and fascination that lingers round the brush of the painter and lures her (her, the kitchen slave) to drop the gridiron and the scrubbing brush, close the door, and seek her chosen niche, and there, with brush and palettes, trace out with deft fingers, and soul and spirit shining in her eyes, the beautiful reflections of creative genius. Ages of reason and servile toil could not destroy this love—it is immortal.

How often, O my sisters of the pen and frying-pan, do we, while scrubbing and rubbing with all the force of our physical being, turn with longing to the little desk at the window, where is waiting at our leisure our faithful pen, and long to trace on paper some pleasant thought, some sweet remembrance, or some hope of the future, which, mayhap, might live in glowing words to do good, long after the polished floor has moldered into decay! How often, as the busy hands are kneading the great batch of bread, our thoughts are far away, weaving poetical pictures and golden fancies, "like apples of gold in pictures of silver," that might comfort and console many a burdened heart; but, like the galley slave, there is no rest—the bread must be made, the fiat is inexorable. Oh, this physical nature! how the mind is made subservient to its commands! What slaves we are to appetite and fancy and fashion, and what an irretrievable loss of precious hours in ministering for their demands. I wonder if any of us stop and think seriously of the useless toil we perform for our physical wants—not our needs. If we only thought it, our needs are few. Many a young housewife thinks her kitchen floor must be always kept white and clean enough to eat off of. Just such foolishness wears out many a woman in her prime, sows the seeds of disease and makes age a terror. The floor is not intended for a table, but to walk on; clean it once a week and always sweep clean, and do no unnecessary work that will overtax strength.

If I were to "deliver myself of some of my tiresome personal experiences," I would "rise to remark" that in the kitchen I have come off, if not conqueror, then it may be considered a "drawn battle," having achieved a triumph in two important points—bread-baking and washing. By the two methods my work in these essentials is diminished more than one half, which all will agree with me is a signal victory. The art of making quickly good, light and wholesome bread every time is not known to every housekeeper, and was only arrived at by me after many years of patient endeavor and experiment—the receipt was given in a former number of the RURAL; but if any one desires it, will cheerfully send it.

My washing machine is the Missouri steam washer—have used it with Gillett's washing crystal a long time. It is simply a blessing over the old way of washing by main strength and ignorance.

A man or a woman of refined sensibilities, who is forced through circumstances to stoop to drudgery of whatsoever kind, must necessarily crush and smother their spiritual growth, must crucify their innate longings, and starve that part of them that is immortal. By the inexorable laws of man (I shall not say Nature) this fact seems inevitable, there seems to be no way out of it. If some great reformer would arise and point a way out of this kitchen and household drudgery, every woman would do him homage. Do we not, O sisters of the kitchen! realize or dimly feel what under more kindly circumstances our possibilities might have accomplished? But it is vain to think of it. Let us rather do the battle of life bravely, not looking back, but in patience remembering "Whatsoever thy hand findeth to do, do it with thy might," at the same time take courage and wisdom from the ripe experience and brave letters of the band of toilers so kindly given in the RURAL PRESS.

Arcadian Hights, March 14.

"The Excursion."

[Written for the RURAL PRESS by F. H. A.]

EDITORS PRESS:—Truly, this is a world in which opinions differ. When I read "C. P. N.'s" interesting but caustic essay in the RURAL of March 19th, I could not but recall other and more favorable criticisms on Wordsworth's writings, and feel like sending you a few thoughts of my own.

Christopher North (the *nom de plume* of John Wilson of *Blackwood's*) has said there is no other such song as Wordsworth's, and that his poetry stands distinct in the world.

Of "The Excursion," R. H. Dana has said: "It is the noblest poem in the English language since Milton's 'Paradise Lost.'"

I will confine myself in the following remarks to mention of it alone, though there are others which I would like to speak of.

Were it only for the healthy optimism of "The Excursion," it would be a valuable poem, and the character of the "Wanderer" is an ideal the emulation of which would make a very different world. But independent of both these, the descriptive power of the book, the deep insight and breadth of mind displayed, are such as to afford high intellectual profit and enjoyment.

How any one, though more especially a lover of nature, could call this poem "a dreary waste" passes my comprehension. "C. P. N." makes some extracts from it and asks "who would dream" that they were "originally written in blank verse?" I for one have certainly never read such flowing and musical sentences in anything but blank verse. As Mr. Gladstone said of the new "Locksley Hall," that he was as much impressed with the form as with the substance, so do I feel about "The Excursion."

Almost the first striking thought we meet on opening Book I is that this poet, who *can* sing, pays tribute to the poets who *do not* (as did Oliver Wendell Holmes not long ago). He says:

"Oh, many are the poets that are sown
By Nature. Men endowed with highest gifts,
The vision and the faculty divine,
Yet wanting the accomplishment of verse.
* * * * Strongest minds
Are often those of whom the noisy world
Hears least."

Then begins the description of the "Wanderer's" life—that man so deep, so mild, so charitable, so far-seeing and so full of faith. He was a country lad, and from communion with Nature

"long before his time
Had he perceived the presence and the power
Of greatness, and deep feelings had impressed
So vividly great objects, that they lay
Upon his mind like substances."
* * * * * *
"He had felt the power
Of Nature, and already was prepared,
By his intense conceptions, to receive
Deeply the lesson of deep love which he,
Whom Nature by whatever means, has taught
To feel intensely, cannot but receive."

I cannot read the following without a reflex (faint enough, alas!) of the rapture and fervor and exaltation that must have glowed within the poet's soul when it emanated from his brain:

"Early had he learned
To reverence the volume that displays
The mystery, the life which cannot die.
But in the mountains did he *feel* his faith,
All things responsive to the writing, there
Breathed immortality. * * Low desires,
Low thoughts, had there no place, yet was his heart
Lowly, for he was meek in gratitude.
* * * he learned
To look on Nature with a humble heart,
Self-questioned where it did not understand,
And with a superstitious eye of love."

What pathos and poetical expression is contained in these words:

* * "O sir! the good die first,
And they whose hearts are dry as summer dust
Burn to the socket."

All rules admit of exception, but there is not a few that have not felt the truth of this.

Now comes the tale of Margaret. How many lessons we are taught by her gentleness and constancy.

"She was a woman of a steady mind,
Tender and deep in her excess of love;
Not speaking much, pleased rather with the joy
Of her own thoughts."

"Not speaking much!" What a sermon lies in those three words! Margaret's story brings the tears, but not bitter ones. Somehow, as if already permeated by the optimism of the poem, we feel it may have been all for the best—her grief and even her weary and hopeless waiting. Instead of being rebellious, we have a sense of gentle, if sorrowful, resignation.

A little on and we read that

"consolation springs
From sources deeper far than deepest pain
For the meek sufferer. Why, then, should we read
The forms of things with an unworthy eye?"

The "Wanderer" then refers to a moment when gazing on some tranquillizing aspect of Nature when

"all the grief
That passing shows of Being leave behind,
Appeared an idle dream, that could maintain
Nowhere dominion o'er the enlightened spirit
Whose meditative sympathies repose
Upon the breast of Faith."

A few more lines and we come to the close of Book I. In the next we are introduced to the "Solitary"—a skeptic, who is the only discordant element in the poem, and yet who, paradoxical as it seems, only adds greater harmony to it. And now we are given the aspects of life from an optimistic and pessimistic point of view, which are full of keen interest and instruction.

In Book IV, "Despondency Corrected," occurs one of the most exquisite passages in all literature, though all the intervening pages are characterized with high and reflective images of thought and fancy.

"I have seen
A curious child, who dwelt upon a tract
Of inland ground, applying to his ear
The convolutions of a smooth-lipped shell,
To which, in silence hushed, his very soul
Listened intensely; and his countenance soon
Brightened with joy, for from within were heard
Murmurings, whereby the monitor expressed
Mysterious union with its native sea.
Even such a shell the universe itself
Is to the ear of Faith, and there are times,
I doubt not, when to you it doth impart
Authentic tidings of invisible things.
Of ebb and flow, and ever-during power
And central peace, subsisting at the heart
Of endless agitation."

The strain from this on to the close of this Book IV is almost equally elevated and noble. Although apprehensive of what the editor will think of my many quotations, I cannot refrain from giving some of these lines:

"The man
Who in this spirit communes with the forms
Of nature, who, with understanding heart
Both knows and loves such objects as excite
No morbid passions, no disquietude,
No vengeance and no hatred, needs but feel
The joy of that pure principle of love
So deeply, that, unsatisfied with aught
Less pure and exquisite, he cannot choose
But seek for objects of a kindred love
In fellow-natures and a kindred joy.
Accordingly, he, by degrees, perceives
His feelings of aversion softened down.
A holy tenderness pervades his frame;
His sanity of reason not impaired,
Say, rather, all his thoughts now flowing clear,
From a clear fountain flowing he looks round
And seeks for good, and finds the good he seeks,
Until abhorrence and contempt are things
He only knows by name. And if he hear
From other mouths the language which they speak,
He is compassionate, and has no thought,
No feeling which can overcome his love."

The volume contains five more books. It has not been my fortune to find in any of them "dreary wastes." I am only too thankful the poem was recommended to me for perusal, and it is one I will always prize. However, we do not always look at things from the same standpoint, and the reader will perhaps be safe in not accepting wholly either adverse or favorable criticism, but in judging for him or herself.

Woman's Work—Wash Day.

[Written for the RURAL PRESS by JEWELL.]

In these uneasy days of unsettled labor questions, when the poor seem to be getting poorer, and the rich richer; when toil seems to be the heirloom of so many, and all mankind are reaching out for ways to live without overworking; when families in the city are unable to send their washing to the laundries as too expensive, and unwilling to employ Chinese, as it is against their principles, yet have a dread of doing it at home—because of the trouble; when farmers' wives and daughters, too far from washwomen or laundries, are obliged to toil at the washtub, and have such hard, dirty clothes, too, to wash, (men's and boys' clothes usually), what a boon to womankind would be a good washing machine. While I have never until now owned one that I could work, I have advocated them as good and useful, any of them, from the one standpoint of helping to relieve women of their hardest work, not alone in the saving of labor, but the help that the men usually give in "turning the machine."

It is not beneath their dignity to do that, because too hard for a woman to do, while it would be unmanly to rub the clothes on a board—as if that, too, was not too hard for most women.

Long have I pondered this subject; many the "fluids" and different soaps and ways of easy washing tried, until I thought I knew all about it, or all that was worth knowing, and still there was hard work in washing, make it as easy as you can. But a few weeks ago, a gentleman in Michigan sent me one of his patent washers to try, and lo! I not only save time and labor but soap, too! I am trying it a little longer, to see if it will do all that is claimed for it, that is, washing feather beds and carpets whole. I tried men's and boys' pants, which were made clean and easily done, with no wringing or handling but the putting in water and taking out to hang up. I am not agent for the washer, so will not blow too big a horn for it—only I feel that if it is what I hope and think it, our farmers' wives will want them—especially as the cost is low also.

But I started to tell how it is possible washing day can be made easy *without* a washer. This is my way of planning it: After breakfast is over I put on the boiler, which the boys fill full of cold water, in which I put five cents' worth of borax and a third of a cake of soap (I am using borax soap now); then I put in my sheets, pillow slips and such cleanest white clothes, filling the boiler full, though it is better if not too full. Cover tight, keep a

good fire, and go at other work. By the time dishes are washed, house in order, and vegetables prepared for dinner, the clothes are at boiling heat and ready to take out, rinse and hang up, for they need no rubbing if you have poked them well while in the boiler. The rubbing of the rest is easy (as rubbing goes), and the time saved considerable, to say nothing of one's strength, soap, and wear and tear of garments. With a wringer (and small boy to turn it), set tubs with drain attached, and water convenient, washing day is a holiday compared with old methods of washing. And now with my new washer I save another proportion of labor, on garments one cannot boil.

Los Gatos.

Thoughts on Home.

[Written for the RURAL PRESS by "NESTLING."]

Few things are more pleasing to the eye than a nice and pleasant homestead. How easy it is to be neat and clean, to arrange the rooms with the most graceful propriety. How easy to invest our homes with the spirit of good taste, which can never be seen without being fully appreciated. But true elegance exists chiefly in the spirit which pervades the apartments, and their arrangements by the tasteful hands of the occupants.

Home should be the seat of happiness, especially for men and boys, for if they do not find it there, they will seek it elsewhere.

Every one at home should be kind and obliging, so that in after years, when we are all widely scattered, we can think with kindness of the home of our childhood, where thoughts so pure and aspirations so noble and lofty, were instilled into our minds and characters as to ever leave their impression upon our after lives.

Crow's Landing.

Nimrod Nuisance.

The following letter to the Fresno *Expositor* is piquant enough to go farther:

HUGHES CREEK, March 8, 1887.

MR. EXPOSITOR:—A gang of men came up here a few days ago, along with Sheriff Meade and Frank Lewis, a hunting, and how they did hunt. We never saw hunting up here before. They shot at everything, but did not get much mutton. One of them went out on the trail of a sheep with a Siberian bloodhound, and when he got down to my sheep camp, he saw my pack-saddle sticking up through the snow, and he must have thought it was a deer's head, for he shot about 15 Winchester rifle balls into it, and tore it all to pieces. His dog showed himself to be a pointer, as he pointed for home as soon as the shooting commenced. The young man who tore up my saddle said he was a brother to County Clerk Williams, but I expect he wasn't.

Frank Lewis spent most of his time hunting red deer a few miles from here; and another one by the name of Austin, so Frank Lewis said, shot the schoolmarm's dinner bucket to pieces, and liked to have broke up the school. Jim Meade cooked some bread up here and the boys have been trying to shoot a hole through a piece of it ever since they left, but it flattens bullets. They say that one of them was a guard by the name of Woodward, or something like that. They called him major, and he followed the dog tracks where Williams went on a still hunt for my pack-saddle, for about two hours, and thought he was after a bear. I tell you they were a holy terror; and if they come up here again we want to know so we can move out of the way. It's no fun, I tell you; and dinner buckets and pack-saddles costs money. If you hear any one talking about coming up to hunt, please tell them there ain't no game up here any more. It's all gone over the mountains. I tell you, you've no idea what a set of hunters they were. Tell Frank Lewis we propose to dismiss school if he comes here again. No more at present.

Yours truly, —— ——.

HIDDEN DANGERS.—Young man, are you a total abstainer from intoxicating drinks? If not, will you take time to ask yourself seriously and candidly why you are not? Do you drink because you are fond of the drink and its effects? Then your reason is the same as that of the hopeless drunkard. Do you drink because you dislike to admit to yourself or others that you fear that you are in danger of losing your self-control? Let me ask you if you have not partially lost it already. Are you sufficiently independent to be safe? If in the absence of temptation you experience physical discomfort or mental depression from which you find relief in drink, you may be sure that the destroyer has begun his work upon your physical organization. Stop it while you can. It may already be more difficult to do than you suppose. A trial may bring to you very unexpected and unwelcome evidence of your danger. Remember that it is by neglecting to use the power to refrain that the power is lost; that self-confidence with an underestimate of the power of habit, and of the stealthy, undermining power of alcohol, are the hidden rocks upon which the great mass of drunkards have made shipwreck of life.—"*Observer*" *in Red Bluff Sentinel.*

SIXTY-FIVE varieties of lettuce are known to horticulturists.

YOUNG FOLKS' COLUMN.

Always Tell the Truth.

[SELMA'S first story for the RURAL.]

Mrs. Gray was a lady living in the town of G——. Her husband was a rich merchant. They had an only child named Jamie. He was a bright, pretty boy about five years old. Jamie had a little pet dog named Jip. Jip and Jamie were very fast friends.

One day Mrs. Gray told Jamie, before going out to see a neighbor, not to go into the parlor for fear he or Jip might get into mischief. Mrs. Gray had a beautiful China basket which stood on a little table in the corner of the room. After Mrs. Gray had gone out, Jamie longed to play marbles on the soft carpet in the parlor. Jamie did not want to let Jip into the parlor, for he was afraid he would break something, so he took Jip to the kitchen door and put him out. While Jamie was closing the door Jip slipped back again unnoticed by Jamie. Then Jamie went into the parlor, and of course Jip followed. Jamie crossed the room where a beautiful rug lay in front of the sofa. He sat down on the rug and began to play marbles. He had played a long time, when suddenly he heard a crash, and looking up he saw Jip on the table and the beautiful basket of flowers on the floor broken. Jamie was so frightened he could not move. When Mrs. Gray came home she found her little boy very pale, and asked what was the matter. Jamie burst out crying and told his mother what had happened. Then Mrs. Gray kissed her little boy and said: "I will not punish you, Jamie, for you have told me the truth." Jamie grew to be a noble young man, for he always told the truth.

Pleasanton, Cal.

A Story About a Donkey.

Teddy and Neddy were two pretty little donkeys, which had been given to May and Gerty by their godfather. They always came running up to them when they went into the paddock where they were kept, and Teddy would rub his nose against May and grunt for some bread or apples, which he liked very much; and they would both follow May and Gerty all about the field, and put their heads over the stile with a sorrowful look when they went away.

One day May and Gerty were going to ride, so Bob, the garden boy, put the saddles on the donkeys and brought them around to the porch. May was ready waiting there, so she ran out and threw her arms around Teddy's head and stroked his long ears, and then she said, "Would you like a bit of bread, my dear?"

Teddy picked up his ears at that, and seemed to understand; so May ran to the kitchen and cried, "Cook, cook, please give a poor hungry donkey a crust."

Cook smiled, and took some bits of bread from a plate and gave them to May, who got back to the porch just as Gerty came down.

"Where's Teddy?" cried May, seeing that he was not at the door. "He was here just now, and I have got this bread for him. Where can he be?"

"I don't know," said Gerty; "isn't he on the lawn?"

"There's Bob, I'll ask him," said May, running across the grass toward the garden boy, who had been among the shrubs cutting a twig for her. "Bob, where's Teddy?" cried May; "we can't find him."

"I left him at the porch, miss," said Bob, opening his eyes very wide when he saw no Teddy there. "What's become of him?"

"It's so odd," said May; "he must have hid himself for fun. I must go and tell auntie."

"Auntie!" she cried, as she ran into the drawing-room; but she suddenly stopped and burst out laughing, for there, standing on the rug, was Teddy, with his saddle on, looking as pleased as possible, very likely thinking that he had got into a beautiful new stable.

Gerty came in to see what May was so merry about, and she, too, laughed heartily, as you may suppose.

Mr. Teddy, you see, finding the doors open, had thought he should like to walk in; and when he was there he did not seem to want to walk out, for Bob, who was called in to lead him away, could not get him to move. Naughty Teddy planted his feet firmly on the ground and would not be led out.

"He must have the stick," said Bob, and he lifted May's riding whip.

"Oh, no, no, please," cried May. "Don't, Bob, please; he'll be very good. Come with me, Teddy dear, there's a darling!" and she held up a bit of bread just in front of Teddy's nose.

Ted moved a step forward and May moved a step backward, still holding the bread just too far off for him to reach it, and then Teddy moved another step, for he could not resist the bread; and so at last May coaxed him out of the room and through the hall to the porch, saying, "You shall have it, Teddy dear, when you are quite good." When he had his feet really on the gravel walk, May patted him and said: "Now you may have it, Teddy; you didn't know any better, did you, dear?"

But after this Teddy was carefully watched when he was brought to the porch, lest he might take a fancy again to visit the drawing-room.

The Foolish Friends.

In the depths of a forest there lived two foxes, who never had a cross word with each other. One of them said one day, in the politest fox language:

"Let's quarrel."

"Very well," said the other; "as you please, dear friend. But how shall we set about it?"

"Oh! it cannot be difficult," said fox number one; "two-legged people fall out, why should not we?"

So they tried all sort of ways, but it could not be done, because each one would give way. At last number one fetched two stones.

"There," said he, "you say they're yours, and I'll say they're mine, and we will quarrel and fight and scratch. Now I'll begin. Those stones are mine!"

"Very well," answered the other, "you are welcome to them."

"But we shall never quarrel at this rate!" cried the other, jumping up and licking his face.

"You old simpleton, don't you know that it takes two to make a quarrel any day?"

So they gave it up as a bad job, and never tried to play at this silly game again.

GOOD HEALTH.

How to Promote Health.

After all that has been stated of the effects of the atmosphere in high altitudes or at the level of the sea, the influence of forests and ocean, of sea coasts and interior places, humidity and dryness, cold and heat, the winds, electricity and ozone, and no matter what of other conditions, the paramount considerations for the promotion of health are an abundance of pure air and sunshine and outdoor exercise. Without these, no climate is promotive of health or propitious for the cure of disease; and with them, it is safe to say, the human powers of accommodation are such that it is difficult to distinguish the peculiarities of any climate by their joint results on the health and longevity of its subjects.—*Bell's "Climatology."*

The above is well and truly said, and the most important of the three requisites enumerated is "outdoor exercise." Going to the springs, going to the seaside, or going to the mountains is all good for invalids; but going into the garden in any reasonable kind of a climate and working in the ground with the hoe or spade moderately, but with sufficient outlay of strength to produce a reasonable degree of perspiration, for one, two or three hours daily, will do more to promote health than either medicine, springs, seaside, or mountain. We have tried it and know of what we write. We have witnessed the beneficial effects of moderate exercise of that kind—work—in others, and we know that it is of more value and infinite less cost than the best mineral springs that ever existed. The great trouble with by far the large majority of invalids is lack of exercise of the right kind—of *work* that will make the sweat start and flow freely for one or two hours daily.

The writer once left San Francisco and spent nine months in traveling, and came back but little better than when he went away. He then put on a suit of old clothes, took a hand trowel, got down upon his knees, and dug in his garden, in this city, three or four hours a day, and in six weeks completely regained his health.

Another instance: A young man left London, England, a few years ago, and spent one year in traveling, reaching this city in the spring of the year, but little better than when he started. Having been told of our own experience, he went up to Healdsburg, in this State, went on to a ranch and commenced work, when he was not able to use the hoe or spade more than two hours out of the 24; but he persevered, and in less than six weeks he was able to do a fair day's work. He returned to this city a well man, and went directly to London. He dug his health out of California soil. Thousands of invalids might do the same thing if they would; but to most invalids it is hard medicine to take, and they neglect it, oftentimes to become confirmed invalids, or to meet an untimely death. Exercise—not with dumb-bells, or in any way in the gymnasium, but in the open air, in the form of *work*, turning up the soil, is the best promoter of health that can be devised.

PREVENTIVE MEDICINE.—Dr. C. R. Illingworth thus writes in the *Med. Press:* One of our great aims as physicians is to prevent disease; another is to cut short its course when developed. Our power in these directions finds full scope among that class of disorders now generally recognized as depending upon the reception, growth, and development in the tissues of micro-organic life in one shape or another. By the continual suppression of the growth and development of these forms of cell life, we may, indeed, hope at length to erase the names of the diseases they cause from the category of those "ills that flesh is heir to." The diseases I refer to are scarlet fever, diphtheria, measles, whooping cough, rheumatic fever, chicken-pox, small-pox, syphilis, hydrophobia, yellow fever, *et hoc genus omne.*

DOMESTIC ECONOMY.

Tested Recipes.

[Written for the RURAL PRESS by M. W. C.]

Mrs. H.'s Chocolate Cake.—One cup sugar, half cup butter, half cup water, one and a half cups sifted flour, one small teaspoon yeast powder, two eggs beaten separately, one square (or two sticks) of chocolate, grated. Vanilla flavor, half teaspoon. Bake it in a flat, or in several small, square tins, and ice.

Almond Icing.—Blanch one-fourth pound or less of sweet almonds (simply remove brown skins, after pouring on boiling water). Pound half of them to a paste, wetting with a few drops of bitter almond. Stir this into an icing of one beaten egg-white and one cup powdered sugar. Spread on the fresh cake. Having reserved a few almonds blanched but whole, cut them into strips, stick in the top of the frosting, and dry slightly in the oven. No harm done if this frosting browns a little in the oven.

Orange Butter Pudding.—Remove all the *white* skin and seeds from the peeled oranges (four or five), slice them and stir into the batter, made of two large cups flour, two small teaspoons of yeast powder, two beaten eggs, one pint milk or water, pinch of salt, same of mace, all beaten well. Bake in a buttered dish; or may be boiled two hours in a tin mold.

Orange Meringue Pudding.—Slice a dozen sweet oranges, pour on a custard made of yolks of three or four eggs, 1½ pints of milk, sugar to taste, and slightly thickened with a very little cornstarch rubbed smooth in a spoonful of cold water. Heap the whites, beaten stiff and sweetened, on top, and, if this is in the pudding bake-dish, set in the oven a moment to tinge the meringue.

Mrs. C.'s Lemon Pie.—Water enough to fill a deep pie plate. Boil it, thicken with one large tablespoon of cornstarch rubbed into a little cold water; add two beaten yolks, one cup of sugar, and one large lemon. Bake the paste separately on the pie-tin, pour in the warm custard, beat stiff the two whites and sweeten, drop these on and brown very slightly.

San Francisco.

COMMON POTATO SALAD.—Small potatoes, which are wasteful to peel and cook with larger ones, should be sorted out for salads. Boil them in their skins, and (while warm) peel and slice them thin. Mince chives, parsley and onion very fine and strew it over the potatoes in the salad-bowl. Sprinkle with salt and pepper, pour over two or three spoonfuls of oil, and moisten the whole with vinegar and water mixed, that it may not be too sour. Chives or onions may, of course, be omitted. Several things are mixed with potato salad, both for flavor and appearance, such as pickled beetroot sliced, a fresh cucumber sliced as usual, a Dutch herring cut up small, or a few sardines minced. Only one of these things, be it understood, and it should be mixed with the potatoes before the oil and vinegar.

ORANGE ROLEY POLEY.—Make a paste as if for apple dumplings, and roll it out in one sheet about like a medium-sized platter, and not much over an inch in thickness; over this lay slices of orange from which the peel and seeds have been removed, roll carefully and steam in a cloth for two hours. Serve hot, with a sauce made of two tablespoonfuls of flour, three of sugar and a heaping teaspoonful of butter; rub these together till smooth, then pour boiling water over the mixture, stirring it all the time, so that as the butter melts the flour and sugar will dissolve, and the sauce will be perfectly smooth; flavor with half a teaspoonful of vinegar and some grated orange-peel. A larger quantity of sauce can be made, of course, but this proportion should be observed.

PLAIN CHOCOLATE.—Scrape one ounce (one of the small squares) of any plain chocolate fine; add to this two tablespoonfuls of sugar, and put it into a small saucepan with one tablespoonful of hot water; stir over a hot fire for a minute or two, until it is perfectly smooth and glossy, then stir it all into a quart of boiling milk, or half and half water; mix thoroughly and serve immediately. If the chocolate is desired richer, take twice as much chocolate, sugar and water. Made in this way, chocolate is perfectly smooth and free from oily particles. If it is allowed to boil after the chocolate is added to the milk, it becomes oily and loses its fine flavor.

SOFT CORN BREAD.—A heaping pint of good, fresh cornmeal, piece of lard size of small egg, half teaspoonful of soda, buttermilk to make thick batter, one teaspoonful of sugar, salt to taste; beat two eggs till very light; stir into the batter. Then from a boiling teakettle pour in water till batter is very thin. Bake in earthenware and serve in same dish with spoon.

CHICKEN PIE CRUST.—One egg, six tablespoonfuls of melted butter, one cup of sweet milk, two cups of flour, three teaspoonfuls of baking powder. This makes just enough for a pie made of one chicken. After the chicken is cooked, put it, with gravy slightly thickened, into an earthen baking dish; stir the ingredients mentioned above together, and spread over the chicken.

TABLE OF CONTENTS.

EDITORIALS.—Herefords for California; Moving for Irrigation, 285. The Week; Beet Sugar; School Savings Banks, 292. Capt James B. Eads; The Millionaire Nation; New Dredging Machinery, 293.
ILLUSTRATIONS.—Thoroughbred Hereford Bull, Dictator, 285. The Late James B. Eads; The New Dredger, Ajax, 293.
CORRESPONDENCE. — From the Ranges of Southern Humboldt; A Voice from Contra Costa; San Diego Notes; Morning Glory Once More, 286.
ENTOMOLOGICAL.—Spring and Summer Remedies Against the Codlin Moth, 286. A Los Gatos Wash, 287.
THE STOCK YARD.—The Nevada Cattlemen, 287.
SHEEP AND WOOL.—Angora Goats, 287.
PATRONS OF HUSBANDRY.—Peach Not Discussed by Newcastle Grange; Stockton and Lodi Granges; Officers Installed; Grange Work and Progress; Facts for the People to Note; March Grange Organized at West Butte; Farmers Organizing; The Gridley Monument; San Jose Grange; Danville Picnic, 288.
AGRICULTURAL NOTES—From the various counties of California, 289.
THE HOME CIRCLE.—A Load of Wood; The Kitchen Slave; "The Excursion;" Woman's Work—Wash Day, 290. Thoughts on Home; Nimrod Nuisance; Hidden Danger, 291.
YOUNG FOLKS' COLUMN.—Always Tell the Truth; A Story About a Donkey; The Foolish Friends, 291.
GOOD HEALTH.—How to Promote Health; Preventive Medicine, 291.
DOMESTIC ECONOMY.—Tested Recipes, 291.
THE VINEYARD.—Misconception of the University Viticultural Work, 294.
THE FIELD.—Wheat Cultivation in India, 298.

Business Announcements.

Agricultural Machinery—Byron Jackson.
Agricultural Implements—Hawley Bros. Hardware Co.
Agricultural Implements—Baker & Hamilton.
Combined Harvesters—Daniel Best, San Leandro.
Carbolic Smoke Ball Company.
Real Estate—McLeod & Wright, Livermore.
Employment Agency—J. F. Crosett & Co.
Sublimed Sulphur—James de Fremery & Co.
Chestnuts—L. G. Sresovich & Co.
Real Estate—Albert E. Crane.
Choice Homes in Contra Costa—H. F.
Soap—Capital Soap Co., Sacramento.
Poultry—E. H. Freeman, Santa Clara, Cal.
U. S. Wind Engine Co.—Batavia, Ill.
Wagons—Newark Machine Co., Columbus, O.
Pumps—Cal. Fire Apparatus M'f'g Co.
Real Estate—Griffin Bros., Cottonwood, Cal.
Crystal Springs—St. Helena, Cal.
Poultry—A. M. Lang, Cincinnati, Ohio.

The Week.

The air is still full of the sounds of activity and progress. Not only are the different counties keeping up a steady hum of their public meetings, which result in organization of Boards of Trade for the purpose of making local resources better known, but there is now arising a sound of enterprise which is made up of many pleasant notes. These are of town, village, and neighborhood improvements, of new wagon roads piercing the inaccessible but valuable country in all directions, and of new street railways by horse and inorganic motors of different kinds, which are much needed in our growing towns where each citizen's premises are measured by acres and distances therefore magnificent. New bridges are doing away with the uncertain and sometimes dangerous fords and ferries. Systems of sewerage by iron-stone pipes are being put in in many towns, and this improvement in sanitary conditions cannot well be overestimated. All these and other similar public enterprises are supplemented by the steady course of individual building which keeps our mechanics busy and the lumber market active. Beyond and beneath all these are the railways which are opening up hitherto inaccessible regions in all parts of the State, and are preparing the way for hosts of new settlements where little sound has been heard save that of beast and bird. All these delightful signs of activity and progress betoken the growth of the State. They are surety to the thousands who are now coming that their predecessors believe in the land of their adoption.

A little rain would be very acceptable. The prophets say April will bring plenty. It sometimes acts very generously. The glorious weather of the last few weeks has drawn heavily upon the stores of moisture in the soil, and the growth of feed and grain is rather thin in some parts. A good rain would be pleasant to all who have crops to grow or land to cultivate.

School Savings Banks.

Among the most noticeable blemishes of our national character at present is the proclivity toward intemperance and waste. How closely one is connected with crime, and the other with poverty, is needless to indicate. Temperance and thrift are a pair of correlatives. We link them together, for it is obvious that whatever promotes one is sure to help the other.

A movement has been started in England, where these twin evils are even more alarming than in our land, closely associated with the public-school system, for the purpose of teaching the children the importance of thrift. It has taken the shape of School Savings Banks. In a recent number of the Adelaide *Observer*, published in Australia, we find the circular of the English Department of Education in advocacy of Savings Banks, from which we take the following as equally applicable to the children and school system of this country:

To learn how to economize slender resources, how to resist temptation to needless expense, and how to make reasonable provision for future contingencies, is an important part of education. Such knowledge is calculated to protect its possessor from much trouble and humiliation, and to help him greatly in leading an honorable and independent life. In mature years, it is often found difficult to acquire this knowledge, and still more difficult to apply it to practice. But in a school much may be done to render its acquisition easy to children, and to show to them the advantages of economy and foresight. * * * Economy, however, is a habit, and is to be learned, like other habits, rather by practicing it than by listening to demonstrations of its importance. During the school life of a child there arise many temptations to the heedless and wasteful expenditure of small sums, and many occasions on which, if the opportunity were offered, such sums might be usefully and wisely saved. The child who is helped to deny himself some trifling present gratification, who is encouraged to save by degrees a few shillings, and who finds this sum available for the purchase of necessaries, for helping his parents at a time of family misfortune, or ultimately for his own equipment on leaving school for work, has received a practical lesson in forethought and self-restraint, which will probably abide with him for life.

The readers of the RURAL who care to explore the workings of this economic system will find in the April number of the *Nineteenth Century*, 1886, an article on the subject replete with gratifying results. The School Savings-Bank method is a French invention. "For 40 years previous to 1874," says the writer of the aforesaid article, "School Banks in France were so far a failure that in 1874 they might have been counted on one's fingers; since 1874 they have multiplied so greatly that they are now to be counted by thousands. In 1885 there were 23,980 School Banks, with 491,160 depositors, whose deposits amounted to 11,934,268 francs."

According to the Adelaide *Observer*, the principle has been favorably received in the schools of New South Wales, and is about to be introduced into the school system of South Australia. It is satisfactory to note that the principle is receiving the attention it deserves in the Eastern schools. It is worthy the consideration of all our School Boards.

So far as we are aware, only two objections have been filed against the system. One is that teaching thrift in the schools will tend to make misers of the children, but in a country where waste and prodigality is the besetting sin, the miserliness developed in the schools will be too small to set up as the basis of an argument. The other is the difficulty in working the system, but the fact that the system is complete, simple, and working satisfactorily wherever tried, ought to be a sufficient reply. It may add a little to the work of teachers, but the head master of the largest and most successful penny savings banks in Liverpool states that with "500 weekly transactions it did not occupy the teachers of each department more than half an hour per week."

Beet Sugar.

It is announced as possible that the sugarie of the Standard Sugar Company at Alvarado may not resume operations this year. It will be remembered that the works suffered by a boiler explosion some weeks ago. The chief owners in the enterprise now state that they have not fully decided concerning the future. It is generally known that the value of sugar is very low. We have already stated that the running of the factory at a profit at all has been because of some very economical processes invented by Mr. Dyer which secured a very high percentage of sugar from the juice. It may be now that even by using these processes the margin of profit is too narrow to warrant the owners in making further investment. If this should prove so, we shall regret it. The fact of cheap sugar is of course an acceptable one generally, but the possibility of home-grown sugar, which should render good returns for thousands of acres of beets and furnish employment to large numbers of our own citizens, was also pleasant to contemplate. It was also possible, as has been stated in the RURAL, that California beet sugar might also cut quite a figure in the sugar supply of the whole country. Conditions at present do not seem very favorable for the demonstration of this fact, though it is quite within the possibilities that it may be called for soon. With the excellent results set forth by the experience at the Alvarado factory, it would apparently require but little to encourage the extension and multiplication of such factories in this State, and for this reason we have always hoped that the pioneer concern might be kept in operation to show the way for our own protection should any effort be make to raise sugar prices. Of course, the public can hardly expect a few capitalists to keep a factory in operation at their own expense for such a wide motive as this. The favors which were asked of Congress in the interest of beet-sugar makers were not granted, and thus the interest which has enjoyed the most liberal fostering by foreign governments, until it reached a good basis, has been allowed in this country to shift for itself, and if it should die, the event will be the occasion for rejoicing by all in the imported sugar interest.

The possible closing of the Alvarado sugarie will not be regretted in California alone, but everywhere on this continent that independence of tropical sugar-cane has been longed for. Readers will remember the quotations which we have made from the government reports on "northern sugar" which expressed the fullest appreciation of the importance to the whole country which might be involved in the Alvarado enterprise. It is and has been for some time the only beet-sugar factory in operation in the United States, notwithstanding the fact that in the aggregate sugar production of the world the beet exceeds all other sources of sugar. In Germany, as may be generally known, the Government long ago adopted the policy of paying a bounty to exporters of beet sugar, which has resulted in a vast output in that country. The London *Grocer* says that the beet-sugar crop this year will be the heaviest ever raised and gives the following estimates for each country for the present season, as compared with the product for 1885 86, as follows:

	1886-87, tons.	1885-86, tons.
Germany.....	1,050,000	825,000
France.....	500,000	300,000
Austria.....	525,000	380,000
Russia.....	475,000	440,000
Others.....	150,000	90,000
Totals.....	2,700,000	2,135,000

This shows what can be done with the beet by enterprise and Government aid. Of course at present we are indirectly enjoying the results of this movement, because the vast production of beet sugar in Europe pushes back the tide of tropical cane sugar upon our markets, but how long we can enjoy this combination of circumstances cannot be prophesied.

Naturally, the possible closing of the Alvarado sugarie attracts the attention of those interested in industrial questions, and especially those of an agricultural bearing, in the whole country. Prof. W. A. Henry, of the State University of Wisconsin, who visited California last summer, recently wrote to the *Bulletin*, of this city, on the subject, and we quote this paragraph:

I fear the explosion and damage to the machinery may cause the collapse of the only beet-sugar factory in America and so add another to the already long list of failures in the effort to profitably extract sugar from the beet. All the more, too, do I regret to see a failure, if it is a failure, of a factory in California, for in that State of all others in the Union, can beet-sugar making be made a success if once it can but gain a fair degree of confidence from capitalists and have fair showing and honest treatment in the manipulation of the beet and its product by skilled and scientific men in the factory. * * * There is not, I venture to assert, a single vital point in the beet-sugar question, from a California standpoint, that Mr. Dyer, the superintendent of the Alvarado factory, and his son, the chemist, have not satisfactorily solved. Working alone, with antiquated machinery saved from the wrecks of other adventures both in California and the East, the wonder is not that they have made but little money, but rather that they did not long ago give up in despair. If their factory was equipped with such machinery as can be seen in the best factories of the Old World, even with the Sandwich islands pouring cheap sugar through the Golden Gate, they could still make a reasonable interest on the investment. If Germany and France can drive the sugar of the tropics out of many of its best markets, California can furnish all the United States can ever use.

It is hard to let a small accident like a boiler explosion give the death-blow to an industry which can thus be described, and we sincerely hope that such may not be the outcome of the present uncertainty in the affairs of the factory.

Next!

The Hydrocarbon-Burner agent and Hayfork fiend having had their day, the traveling swindler next in order is the "Wire-Fence" man. Like his fraudulent forerunners, he is anxious to do you great favors—"being it's *you*"—if you will but sign your name to some sort of an order, contract or memorandum for him. If you do sign it, it will turn up within a few weeks at the bottom of some kind of an obligation to pay money. We again repeat the old, old counsel: *Never put your signature to any piece of paper for a stranger.*

FRUITS AND FLOWERS IN OAKLAND.—A fair for the display of flowers and seasonable fruits only is to be held in Oakland, commencing on Monday, the 18th of this month, and continuing through the week. It will be under the management of Wm. R. Bentley, who has secured Cavalry hall for the purpose. Leading florists, gardeners, and nurserymen, of Alameda county, have given assurances that they will take part; and it is hoped that all residents of Oakland having choice flowers in pots or boxes will exhibit them, and thus let the general public know what is being done in the way of floriculture. Eight cash prizes will be given for the best displays in the various classes. A ground plan can be seen, and space for exhibits secured at the office of the *Times*, in Oakland.

HORSE SHOW AT SAN JOSE.—A horse show was held at the San Jose Fair grounds, March 19th, under the auspices of the Santa Clara Valley Agricultural Society. There were exhibited nearly 140 animals, including fine trotters, draft and carriage horses. The occasion brought together 600 or 700 visitors, who seem to have been highly gratified with what they witnessed, and the *Mercury* winds up a somewhat detailed report by saying that "the affair was in every particular a success."

NUT-GROWING.—We are obliged to defer until next week our full report of the discussion on nut-growing at the Horticultural Society meeting last Friday. The report will contain many interesting points of experience, especially in the growth of almonds.

DRAFT POULTRY.—Horses, mules and oxen will probably continue the most useful and popular draft animals for general purposes, but a Michigan man has a turkey that has been trained to draw a sled.

THE silkworm eggs, which the State Board expected from Italy, have arrived in good order,

Capt. James B. Eads.

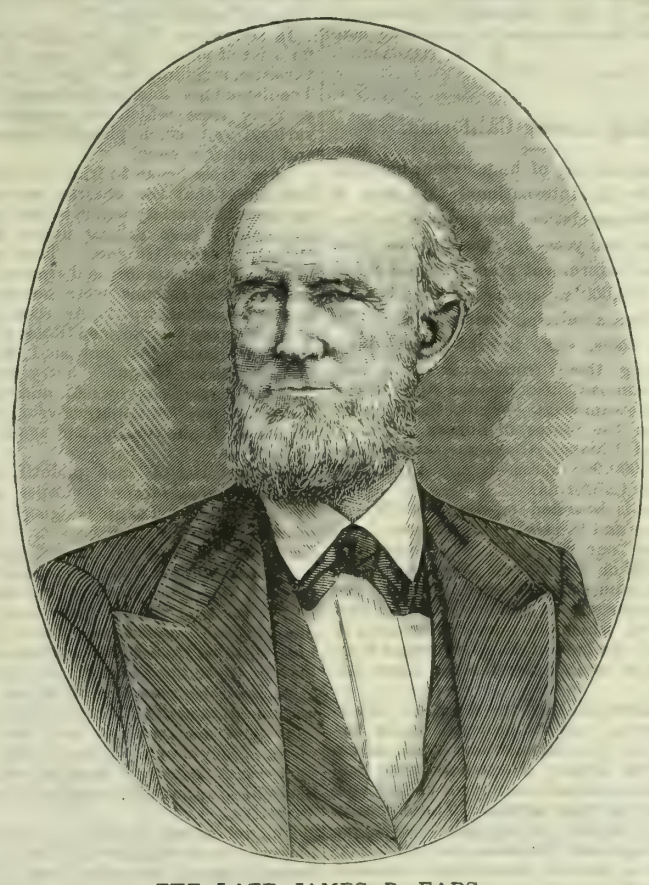
[Died at Nassau, West Indies, March 6th, Captain James B. Eads.]

Human nature is the same in kind, but how different in degrees. Some men are born with great potential powers, others with but little. The more favorably endowed may be divided into two classes—the men of thought and the men of action. The men of thought are those who discover great ideas, general truths, universal laws, and are the men of genius in art, science, or political economy, but as a rule do not possess gumption enough to buy a beefsteak or a suit of clothes. The next class are the men who organize ideas, truths, and laws; they concretize the abstract, particularize the general; they know how to put ideas to work, organize science into railroads, steamships, mills, bridges, and general utility. They are the busy men of affairs who spread out their organizing genius upon the soil, weave and spin for the human race, span our rivers, organize fire and water, iron and wood into a new sort of animated creature.

Captain Eads was a fine example of the latter class. His father was one of the early pioneers of Scott county, Iowa, and there are old men that remember the poor, barefooted boy that used to play in the streets of Davenport, without advantages of any kind, walled in by environments that would have crushed the average boy into hopeless obscurity. But this boy had the right sort of metal in him, and, though compelled to work hard and struggle against poverty and humble position, he was a great student and devourer of books. Few men ever had to fight against such discouraging reverses, and fight so long, and yet from sheer pluck and an indomitable, fearless will, he fought himself to the head of the great army of engineers and made himself a name his country may proudly honor.

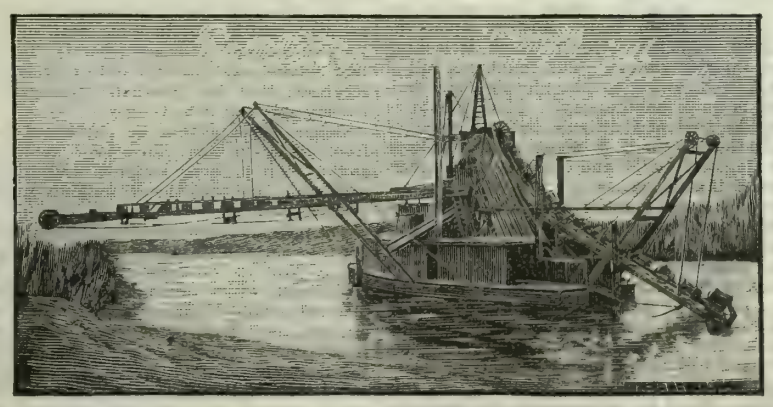
When only 20 years old he was a clerk on a Mississippi steamer, and by indefatigable business energy, had amassed a fortune at 37 he could have handsomely retired upon. But the war broke out, and his knowledge of the great water-ways of the country was so great that the Government called upon him to devise means for their defense. The important service rendered by the fleet of splendid gunboats he built is a part of the history of that memorable struggle. At the close of the war, at the age of 45, he could have retired with a record sufficient to gratify the ambition of most men; but the bounding vitality and energy of his nature could not rest, hardly knew how even to take respite in recreation. We next find him for four years engaged in constructing the great iron bridge across the Mississippi opposite St. Louis—a bridge that has been pronounced by the greatest engineers the finest specimen of metal arch that has yet been erected. The piers of this mighty work rest on caissons sunk 110 feet below the surface of the river, upon which rest the steel arches that span this immense body of water. The most daring engineers and river captains of the day regarded the enterprise as impracticable and a waste of time and money. He next attacked the problem of opening a channel at the mouth of the Mississippi 20 feet deep, that was almost universally regarded by the best engineers as preposterous; but the success of his jetties and the principle upon which he wrought—that of using the river to scour out its own channel—has not only been recognized as practical but has been put into practice elsewhere. He then planned the great ship railway across the Isthmus of Tehuantepec—a scheme that has been so amply illustrated in the RURAL, through our own editorials and the copious correspondence of his ardent friend and admirer, L. F. Moulton, of Colusa county, that our readers are quite familiar with it. After securing certain grants and privileges from the Mexican Government, he worked incessantly for several years to persuade the Government of the United States to guarantee the interest for 15 years on two-thirds of the capital of the company; but being unable to convince Congress of the practicablity of the scheme after a vast expenditure of patience and learned dissertation, he at last consented to accept a simple charter of incorporation, which was granted by the Senate only ten days before his death. Those who had the pleasure of seeing the great engineer on his visit to this State in 1879, stout and hale, apparently in the vigor of manhood, will hardly realize that he was 67 years of age. Whether this splendid scheme dies with the daring genius that conceived it, the future alone can determine; but it is almost certain that all effort to consummate the work will have to be postponed.

Capt. Eads, whose portrait we give on this page, was at one time Consulting Engineer of the State of California, having been appointed to fill the place made vacant by the death of Col. B. S. Alexander.



The Millionaire Nation.

The Chicago *Tribune* recently printed an interview with Senator Allison, in which he expressed the opinion that an extra session of Congress will have to be called, not later than October, to grapple with the surplus question. As Mr. Allison is Chairman of the Senate Appropriation Committee, and has a fine opportunity for acquiring knowledge of the financial condition of the Government, his opinion carries weight in financial circles as well as in Congress. He says the receipts of the Government for the next fiscal year are estimated at $410,000,000, while the expenditures will not exceed $364,000,000 in all, leaving a surplus of $46,000,000. This assumes, however, that the Treasury will purchase during the year $47,000,000 of unmatured bonds for the sinking fund. If this be not done, then the surplus will be $93,000,000. To this must be added whatever surplus the Treasury will have on the 30th of June next, which amount will, however, be small if all the three per cent bonds are recalled. After the first of July the accumulation will be steady.



As to the advisability or inadvisability of calling an extra session for the reduction of Government revenue, we at present have no concern; we merely call attention to this exhibit as a fact unprecedented in the history of nations. While all the Governments of Europe find it a difficult problem to raise money enough for current expenses, Uncle Sam is so rich that his surplus means is an elephant to him. What better evidence of the bounding health and prosperity of the country? The Republic is built on a rock. The gates of hell cannot prevail against it. *Esto perpetua.*

DUTIABLE VALUE OF WOOL.—A decision that concerns, directly or indirectly, all persons interested in the wool business, is reported this week from Washington. It appears that the Collector of Customs at Philadelphia submitted for the decision of the Treasury Department a question as to which shall be considered the country of exportation in the case of certain Persian wool, which arrived at Philadelphia from London consigned to local merchants. The Appraiser estimated the dutiable value of the wool at its market value in London on the date of exportation to the United States. The importers protested against this action. They represented that the merchandise was purchased at Bagdad for shipment at Bassorah to a port in the United States as directly as the means of transportation would allow, London being the port of transhipment, as there is no direct communication between Bassorah and Philadelphia. They held, therefore, that the market value of the wool at Bassorah on the date of exportation is the value to be estimated for the purpose of fixing the classification of the wool. Acting Secretary Fairchild writes the Collector at Philadelphia that under the provisions of the wool schedule the duty on wools is dependent upon its "value both at the last port and the place whence imported to the U. S." The functions of appraisers are therefore, he says, restricted to finding the value at the last port of shipment.

THE lumbermen of Guerneville are preparing for a busy season.

THE LATE JAMES B. EADS.

THE NEW DREDGER "AJAX."

New Dredging Machinery.

We illustrate on this page the new dredger "Ajax," recently built for Mr. Geo. F. Smith, of Stockton, Cal.

It is entirely a Stockton production, and one of which that city will have no cause to be ashamed. The dredger has now been working for two weeks at Wakefield's, and, we are informed, is giving entire satisfaction; having been repeatedly timed to be discharging clay at the rate of 220 cubic yards per hour.

The Ajax is almost a duplicate of the last dredger designed by Mr. Ferris for levee-building on Roberts island, with such modifications and improvements as have suggested themselves in the two years it has been working.

The hull, oval in plan, is 36 feet 10 inches by 60 feet over all; it has 4 solid fore and aft bulkheads, and a well-hole 5x12 feet at one end for the bucket ladder.

The main engine is 10x24, operating by bevel gearing, and a 3½-inch vertical shaft, with a 4-sided upper tumbler with 21-inch sides. This engine works also a gypsy shaft for swinging, and the conveyor that carries the mud ashore. A steam hoist with 6x11 engines raises and lowers the bucket ladder. The buckets, at 4-foot centers, have a struck capacity of 5 cubic feet and are speeded to deliver from 18 to 20 a minute, according to the character of the material being handled. They are of boiler iron, with a 5-inch steel nosing. The links are of wrought iron, with cast bushings. The lower tumbler is hexagonal, on a 4-inch shaft.

The conveyor, projecting 72 feet from the center of the boat, consists of a 5-ply rubber belt 36 inches wide; running over iron drums at each end, and intermediate iron friction rollers at 3-foot centers. Ratchet and pinion on each side of conveyor ladder give means for taking up the slack of the belt, and adjusting the drums to maintain them parallel.

This conveyor is the important feature of the dredge. It is entirely satisfactory in its working and delivers its material, as nearly as may be, in a dry state upon the levee. It was feared the rubber belt would be shortlived, but a 4-ply belt ran continuously for over two years on the Roberts island dredge before it needed replacing.

The boiler is of the marine type, 52 inches by 10 feet 6 inches, with 3-inch tubes and 14-inch flues; and burns about 1400 lbs. of steam coal in a day of 12 hours. There are three pumps aboard—a hand forcepump for washing boiler, a plunger pump for boiler feed, and an Evans steam pump to throw a jet of water into the delivery hopper when digging in any very tenacious material. All three are connected with the boiler.

Water tanks below deck serve to trim the boat and furnish a supply for the boiler. The dredger cuts by swinging on a center spud 16 inches in diameter, and moves forward from 8 to 10 feet at each fleet.

The Roberts island dredger, of which the Ajax is an improved copy, handles steadily 700 yards per day of 12 hours, in the stiffest and most tenacious clay in which it has been worked; and ranges from that average to 1500 yards per day in soft peaty mud.

The Ajax was built by contract by Farrington, Hyatt & Co., of the Stockton Iron Works; their bid having been very considerably below that of a San Francisco firm with whom they were in competition; a fact that certainly pays handsome tribute to the facilities of Stockton manufactories. The hull and framing were built by D. Jarvis, who has succeeded the late S. H. Davis, as proprietor of the Stockton Shipyard.

This type of dredger can be built for about $12,500, and we are informed can be relied on for a monthly average of 26,000 yards in any material met with in the overflowed lands near Stockton, delivered 50 feet ashore at a hight of 10 or 12 feet above the ground line.

THE SWARMING RODENTS.—According to the *Southlander's* correspondence, the Rabbit Inspectors for New South Wales, last October, reported 1914 men employed in rabbit destruction, a number 300 less than the inspectors deemed necessary. The officer in charge of the Rabbit Department expressed a strong opinion that the compulsory provisions of the Act must be stringently enforced. The scalps and carcasses reported to have been destroyed during the month numbered 605,900.

THE VINEYARD.

Misconception of the University Viticultural Work.

University Experiment Station Bulletin, No. 67.

The report of Wine Committee of the late Viticultural Convention, as recently published in the city papers, calls for some comments on my part. The summary manner in which that report disposes of the samples sent from the University Laboratory shows that the committee, or those of its members who agreed to the concluding paragraph, simply misunderstand the purpose for which the samples were submitted to them, as well as the objects and methods of our work.

That a number of the samples were made from vines overloaded and therefore unable to fully mature their crop, which would of necessity produce "green" wines, was elaborately set forth in my published report, as well as in a bulletin previously published. Both publications were sent at the time to each of the members of the committee, as well as to every member of the Grape-Growers' Association. It should therefore have been well understood that these wines were sent to the Convention, not for comparison with the selected best samples, whether of producers or of the Viticultural Commission, but in order to give persons interested an opportunity to judge for themselves of the result of long-pruning and therefore of the overloading of certain varieties. The present season one-half of the same vines will be pruned long, one-half short, and will then show the contrast between the results of a restricted and of an excessive production.

Had I anticipated that the committee would do its work so much more hastily than has been the case in previous years under the able management of Mr. Pohndorff, I should certainly have restricted the samples sent to a few choice ones that happen to have come to hand. For, in the work we have undertaken to do, the aim is not to select choice lots of grapes for the production of extra samples, but to determine the prominent peculiarities of each kind of grape in the several grape-growing regions, the grapes being sent for that purpose by the producers, without any selection on our part. We make the wines as the grapes sent will make them, presuming, as a rule, that the grower sends his best representative sample.

I regret to note that the committee, from some cause, appears to have gone out of its way to condemn summarily the making of small samples. It is admitted on all hands that large samples represent more correctly the large scale outcome than small ones can do. But it is quite certain that the prominent characteristics of any locality, as to its production of sugar or alcohol, acid, tannin, body and color are identically shown by small- as well as large-scale samples, and these, the natural possibilities of each soil and locality, are what our experiments primarily aim to determine. That wines made in 5-gallon packages develop differently from those made in 1000-gallon tanks, is abundantly well known, and the committee appears unnecessarily emphatic on that point. The difference, however, does not even go so far as to prevent the accurate reproduction of the characteristic bouquet, but is felt mainly on the tongue. It will hardly be maintained that the above data thus *accurately* verified, are not of sufficient importance to justify all the work bestowed by us upon their ascertainment. That a competent winemaker will know how to make allowance for the unavoidable differences, and can come to a close estimate of the outcome on the large scale from samples made on a small scale, is abundantly shown by the results obtained from samples made under the most unfavorable conditions, in 1884, with the able co-operation and close criticism of Mr. Pohndorff.

It is easy to say that larger samples ought to be handled at the University Laboratory; but it is not easy to see how, in that case, the natural and legitimate demand for the kind of information now furnished by our work, could be supplied, since neither space nor funds at command would be remotely adequate for the handling of samples exceeding the capacity of 50 gallon tanks. I gravely question, that to fill up our working space with 15 or 20 large fermenting tanks and casks, would give any satisfaction to the large number of growers who desire some definite information regarding the general character of the wines they can expect to produce in their respective localities. To satisfy this demand, I consider by far more important than to "reproduce accurately" the results of large-scale work, which can be very fairly predicted from the outcome of small-scale fermentations.

I must insist that it will require a more deliberate and well-sustained utterance on the part of the grape-growers of the State, to convince me that the system of investigation now adopted by the viticultural laboratory of the University, should be materially changed for the greater good of the greatest number, or that the field of operations should, as a whole, be transferred to the hurly-burly of a large winery in vintage time. There is a certain class of experiments that can be made under these circumstances, but the difficulty of maintaining definite conditions, such as are required for cogent experiments, is very great, on account of conflict with the pecuniary interests involved, and where these are concerned the experiment goes to the wall. Moreover, it is the relatively inexpensive method of small-scale experimentation that most pertinently suggests the proper line of experimentation and progress on the large scale.

I think it is also to be regretted that while stating the full number of samples sent by the University Laboratory at 56, the committee omits to state that less than half of these (27) were actually examined by them. This fact, as well as the very different judgment pronounced by one member of that committee (whose opinion as an expert is especially entitled to respect), after a personal, leisurely examination of a large number of samples in the Laboratory cellar itself, about two weeks before the Convention, suggests that a closer insight into the actual work of the University Laboratory should be had before coming to sweeping conclusions. E. W. HILGARD.

Berkeley, March 26, 1887.

Settling Lower California.

A colonizing scheme of huge extent has been set on foot by the International Company of Mexico. This association, incorporated in Connecticut about two years ago, has obtained from the Mexican Government grants of land covering nearly 100,000 square miles, with concessions to settlers, admitting their needed outfits of clothing, tools, etc., free of import duty, and exempting them from taxes for a long time. The company also has the right to run railroads and steamboats. While these grants lie largely in the States of Sonora, Sinaloa, Guerrero and Chiapas, about one-third of the land—say 18,000,000 acres—is in the northern part of Lower California.

This tract is bounded on the east by the Colorado river and the Gulf of California, and extends from our State line to the twenty-eighth parallel or thereabout. The coast-line is broken by numerous harbors and inlets, the two most important of which are the Todos Santos bay, on which the town of Ensenada is situated, and the bay of San Quentin, a magnificent harbor some miles further down the coast.

It is in this region that the company means to begin carrying out its projects, under the direction of Geo. H. Sisson, whose headquarters are now at San Diego. The whole tract has, it is said, been carefully surveyed, and is now only waiting for the settlers. The company already has a steamer plying once a week between San Diego and Ensenada, on Todos Santos bay; and a railroad connecting Ensenada with Yuma will probably be constructed within a twelvemonth.

C. B. Turrell, a gentleman well known in connection with the S. P. Co. and the N. O. Exposition, is one of the commissioners of the International Company of Mexico. He has lately come back from a trip to the region spoken of above, and has been telling a *Call* reporter about it. He says that the soil is rich and fertile and capable of producing all the fruits which flourish in the southern portions of this State. The valleys run for the most part east and west, and hence are accessible to the ocean fogs which are carried inland, throw down their moisture upon the hills and produce a verdure which is lacking in our interior valleys. The country is full of springs, and, owing to the nightly fogs, irrigation is quite unnecessary. The climate is much like that of California, and the recorded observations of the U. S. Signal Station show it to be singularly mild and equable. The average rainfall is 21 inches.

In reply to the question why a section possessed of such advantages has remained so long unpeopled, Mr. Turrell said: "For the simple reason that it has been cut off from the rest of Mexico by the Gulf of California and the Colorado river. The 500 inhabitants of the section have been absolutely without communication with the rest of the world. Their products they have had to consume themselves, there being no market for them. A country in this condition offered no inducements for immigration; and so it remains unpeopled, save by a few Spanish and American families who live a life of Arcadian simplicity and happiness. The country will grow anything. The date palm flourishes with peculiar luxuriance, and bananas can be raised in limitless quantities. Another thing I may say is that the enormous ranches which have proved so great a drawback in California are here impossible. Small valleys are the rule, and sections of land cut off by mountains from other sections preclude the system of extensive holdings. I look upon this enterprise as one of the most important ever engaged in, and am certain it will be a great success."

ANOTHER HUMANE SOCIETY.—Santa Barbara has organized a branch of the S. P. C. A., whose articles of incorporation were probably filed on the 22d ult. We note thankfully the spread of the movement for promoting kindness to animals; and its tendency should be to make us more considerate of the feelings of fellow-men, as well as of the lower creation.

WEARING THE GREEN.—The Yreka *Union* assisted in the celebration of St. Patrick's day by printing on bright green paper its entire edition for March 17th.

Cherries in Court.

J. M. Bassford, the Solano county fruit-grower, lately sued John Rock, the famous nurseryman of San Jose, for damages, which the former claimed he had sustained through a certain lot of cherry trees purchased of the latter turning out to be of a variety other than that represented and guaranteed. The facts, as brought out at the trial and summed up by the court, are substantially as follows:

Mr. Bassford, who lives near Vacaville, has for many years made a specialty of raising an early variety of cherries, which he markets to advantage and in advance of those grown in other localities. This particular variety he and others in his neighborhood called by name the "Early Purple Guigne."

In December, 1879, he applied to Mr. Rock for a lot of young cherry trees of two or more varieties, including the "Early Purple Guigne." The defendant sold and shipped to him 300 yearling trees which he claimed were of that variety, and which plaintiff received, paid for and planted as such.

These trees began to fruit in 1884, and Bassford found that the cherries were quite different from the variety which he and his neighbors had so long been raising under the name of "Early Purple Guigne." They were inferior in size and appearance, and ripened much later, and for these reasons were nearly valueless to him as a market fruit. As soon as he made this discovery he informed Rock of it, claiming that the latter had not sold him the true "Early Purple Guigne" cherry tree. The defendant insisted that he had, and requested him to let the trees fruit another year, which plaintiff did with like results, and again renewed his claim.

In the winter of 1885 plaintiff grafted said trees with scions from his other trees, called by him "Early Purple Guigne," but left one branch on each tree intact. These uncut branches produced fruit in the spring of 1886.

The case turned upon the single question of fact: "Which of the two varieties is, or is either, the true 'Early Purple Guigne'?" The plaintiff, and several witnesses produced by him, testified that the variety previously raised by him are so known, and have been recognized as such in the counties of Solano and Napa, and on Sacramento river, and have been cultivated and marketed as such for 20 years or more. They described the cherry as ripening very early, as being of firm texture and full or medium size, but little smaller than the Black Tartarian.

The defendant, in giving the history of the nursery trees which he sold to plaintiff, testified that he cut the scions from a large tree in the orchard of one Geiger, near San Jose, and that said Geiger represented to him that it was the "Early Purple Guigne;" that he budded the last block of seedling cherry trees remaining in his nursery in the fall of 1878 from those scions, and that he shipped the 300 trees from that lot in December, 1879.

J. Q. A. Ballou testified that about 1858 he imported from the East, jointly with D. T. Adams, various kinds of fruit trees, among others a lot of "Early Purple Guigne" cherry trees; that Adams retained a portion of each importation.

Mr. Newhall, an experienced nurseryman, testified that he obtained his stock of "Early Purple Guigne" cherries from D. T. Adams; that Adams was a careful and experienced nurseryman; that he (Newhall) propagated that variety and sold it to Geiger.

Geiger testified that he purchased the tree from which Rock cut his scions from Newhall as the "Early Purple Guigne," and raised and marketed the fruit therefrom for a number of years as such.

The defendant also testified that in January, 1880, he shipped to Robert Williams, near Penryn, a part of the same lot of young cherry trees from which were taken the 300 sold plaintiff; while Williams testified that in his orchard, near Penryn, he had planted cherry trees propagated from the orchard of C. W. Reed, in Yolo county, which the latter designated "Early Purple Guigne," and that the following year he had procured 20 trees from a San Jose nurseryman, probably Rock, of the same name to fill up his orchard; that both lots of the trees have fruited and have borne the same variety, which he recognizes as the "Early Purple Guigne."

C. W. Reed testified that he has in his orchard at Yolo the "Early Purple Guigne," which he imported from Ellwanger & Barry, of Rochester, New York; that he had seen another cherry, which sometimes went by the same name, but which was not true to name, being much larger and more valuable for market.

After the action was commenced, Rock sent to Bassford's orchard and obtained a quantity of the fruit raised upon the reserved limbs of the trees in question. This fruit, leaves and branches, were compared with the fruit from the Geiger tree referred to by expert nurserymen, and some of the fruit preserved in alcohol also produced in court.

These experts uniformly testified that the samples were of the same variety and were the true "Early Purple Guigne." Several also testified that they were identical with a tree planted by defendant from said stock and identical with fruit called "Early Purple Guigne" raised from importations by other nurserymen from Eastern nurseries of recognized reputation and good standing.

Judge Spencer's opinion in the case (filed March 26th, in the Superior Court at San Jose) closes as follows:

"Upon the whole, I am of the opinion that the variety sold by defendant is the true 'Early Purple Guigne,' as known and named by nurserymen of standing and reputation throughout the United States, and that the plaintiff was misled not by the defendant, but by the fact that in his locality the name had by accident or through ignorance become applied to a different and more valuable variety."

New Agricultural Districts.

The Agricultural Districts Act, as amended by the last Legislature, makes the new districts to consist of counties as follows:

No. 2—San Joaquin, Merced, Stanislaus and Tuolumne.
No. 4—Sonoma and Marin.
No. 6—Los Angeles, San Bernardino and Ventura.
No. 7—Monterey and San Benito.
No. 8—El Dorado.
No. 14—Santa Cruz.
No. 15—Tulare and Kern.
No. 16—San Luis Obispo.
No. 17—Nevada and Placer.
No. 18—Alpine, Inyo and Mono.
No. 19—Santa Barbara.
No. 21—Merced, Mariposa and Fresno.
No. 25—Napa and Solano.
No. 26—Amador and Calaveras.

At another time we will give a full list of the districts, both new and old.

JACK RABBIT GYMNASTICS.—It is not so very hard to believe that "the damage the meek, humble, sanctified, sleek and slippery jackass rabbit inflicts upon Tulare is beyond calculation," and that "it is only a question of time when these jacks will take the county if something is not done to kill them off." But we have to confess ourselves just a wee bit skeptical as to the literal accuracy of the following, for which the *Register* is responsible: "You have all seen pictured in your old geographies how monkeys will tie their tails together, swing across a stream from a tree-top and thus form a monkey bridge for the whole tribe to pass over on. Well, jack cannot do that, but he can make a rabbit step-ladder out of himself and eat the bark off trees three times as high as he can reach. Two stout jacks stand side by side upon each side of a tree, two more take their places crosswise upon their backs, others follow in the same manner, building themselves up after the manner of a cob-house until the last can reach the branches of the tree where the young bark doth abound. We can produce witnesses who will swear to the truth of the statement."

Our New Street No., 220 vs. 252.

Upon first occupying our present location on Market street, we found our premises numbered 252, and the next door east of us (toward the water front) is numbered 218. This discrepancy of numbers has confused people coming up to our office from the ferry-landing. One-fourth of a block above us on Market street, appear the numbers 400 and upward, there being no numbers used from Nos. 300 to 400. Parties coming down the street and seeing the numbers 400 and upward, knowing our number to be 252, have naturally concluded that they had a block or two to walk before reaching our place, and have frequently passed by our office to suddenly find themselves abreast of numbers 200 and odd, and have to retrace their steps. Much confusion has occurred in this manner. For this reason we have adopted No. 220 [Market street], hoping in a measure to avoid the difficulty, and trusting that some day the city authorities will take the matter in hand, and see that Market street, in our locality, is properly numbered.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

WATERPROOF FIBRE OR PLANT BED MUSLIN.—Circular from the Waterproofing Fibre Co., 36 South St., New York.—This material is designed to take the place of glass in hot-beds, cold-frames and other germinating appliances. It costs about one-tenth as much as glass, is lighter and easier to handle, will not break as glass will, permits a proper ventilation to the plants, and by its peculiar odor renders the premises very distasteful to insects. It is stronger, heavier and tougher than ordinary muslin, or muslin prepared by the home treatment of linseed oil. Three grades are made, varying in thickness, and from three cents to nine cents per yard. It has received the highest testimonial from Peter Henderson and other horticultural authorities. As a protection for the tobacco plant at the South, it is said to be the best preparation in use. Gardeners are requested to examine this material. We believe they will be pleased with it. The firm also makes waterproof cloth of various weights, wagon covers, hay caps, etc.

Cheap Money for Farmers.

Farmers in this State will be glad to learn that they can borrow on mortgage any amount, from $5000 to $500,000, from S. D. Hovey, 330 Pine St., San Francisco, at 6 to 7 per cent and taxes. **

NO MORE SNUFFING, HAWKING, OFFENSIVE BREATH--NO MORE CATARRH!

CALIFORNIANS

WANT

CALIFORNIA TESTIMONIALS

AND NONE OTHER!

When they pay money for a prescription they demand some assurance of a good result. No prescriber warrants. Our National Disease has been neglected and allowed to run its course, because, heretofore, there has been no guaranteed cure. Years of patient toil and research have brought forth the **Only Absolute Cure for Catarrh, Neuralgia, Nervous Headaches, Catarrhal Deafness, Sore Throat, Inflamed Tonsils, Bronchitis, Granulated Lids, Weakness of the Optic Nerve, Diphtheria** and **Quinsy.** We have proved that the "CARBOLIC SMOKE BALL" and the "DEBELLATOR" will cure, by the numerous Home Testimonials published, and which we will be pleased to send to any address.

THE PEOPLE

ARE DONE WITH EXPERIMENTING!

WORTHY THE SCULPTOR'S CHISEL!

THE WORDS OF PRAISE!

THE LETTERS OF COMMENDATION

Received from those who have Tested the Merits of the

CARBOLIC SMOKE BALL!

WE WARRANT OUR CLAIMS!

(Which are constantly being verified by Home Evidence.)

Catarrh—Cured in from three to six months; warranted.

Asthma—Cured in nearly every case; always quickly relieved.

Bronchitis—Cured in every case; warranted.

Hay Fever—A cure guaranteed when taken in time.

Catarrhal Deafness—Cured in from three to six months.

Eyes—Granulated lids, weakness of the optic nerves, etc., cured within two months.

Neuralgia and Headache—Stopped after the third application.

Diseases of Children—Whooping cough cured; croup relieved in five minutes and cured within two days.

Throat Troubles—Quinsy quickly relieved and thoroughly cured, as are inflamed tonsils and ulcerated sore throat.

Snoring—Three doses each night before retiring cures this trouble.

Colds—In the head, cured by a few applications; fresh colds on the chest, in 12 hours.

THE COMPLETE TREATMENT includes the "Debellator" package, unequaled as a blood purifier, which must be used in Catarrh when there is a dropping of mucus into the throat, biliousness, or where the bowels are irregular or there are stomach or kidney disorders. It should be used in all cases of Catarrh, Asthma, Bronchitis, Hay Fever and Ulcerated Sore Throat. Price of the complete treatment, $5; "Smoke Ball," $3; "Debellator" package, $2. One complete treatment is generally sufficient.

MAIL ORDERS receive careful and prompt attention. State disease or symptoms in writing, addressing MAIN OFFICE. Complete treatment mailed on receipt of price, $5, and four cents in stamps. "Smoke Ball," $3 (four cents in stamps). "Debellator" packages, $2.

"CARBOLIC SMOKE BALL" CO., 652 Market St. {Cor. Kearny, Rooms 7, 8, 9, 10} San Francisco.

COMBINED HARVESTERS.

PULL and PUSH, BELT and GEARED.

Houser, Minges, Shippee, and Powell

THE LEADING HARVESTERS OF THE PACIFIC COAST.

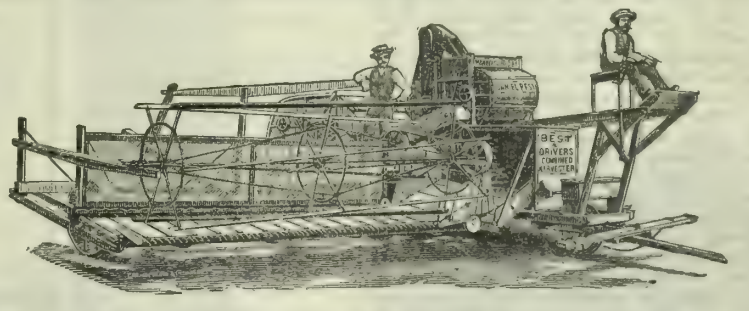
THE HOUSER BELT IS OUR STANDARD.

THE BEST KNOWN AND MOST POPULAR.

800 in Field Use and No Failures.

NONE EVER RETURNED TO THE WORKS.

HAS STEEL SHAFTING & GEARING & WIDER CYLINDER than 1886



They are built for 1887 with 30-inch Cylinder and 42-inch Separator. We are also building them with 46-inch Separator.

They Cut, Thrash, Clean, and Sack

For less than $1.00 an acre, and place the grain in the sack at less cost than the old method of putting it in the stack. **They Save Three Bushels an Acre** over and above Heading and Thrashing, or enough grain to pay the cost of harvesting.

THEY REQUIRE FROM THREE TO FOUR MEN AND TWELVE TO TWENTY-FOUR ANIMALS, according to width of cut and condition of grain. ☞See Testimonials and large cut of the Houser, outside pages, RURAL PRESS, issues of January 15th and 29th. Call at Works. Send for Circulars. Address

STOCKTON COMBINED HARVESTER & AGRICULTURAL WORKS.

Best & Driver's

IMPROVED COMBINED HARVESTER

For 1887.

—MANUFACTURED BY—

DANIEL BEST, San Leandro, Cal.

Standard size, 14-foot cut. Cylinder, 30-inch. Separator, 41-inch. Belt and Geared. Will make any size ordered.

These machines are made of the best material. Frame of Separator is made of hard wood and all timber used in their construction is thoroughly kiln dried.

HAS STEEL SHAFTING AND GEARING.

The Gearing is composed mostly of Spur Wheels, and so compactly arranged that should the frame of the machine weave because of the unevenness of the ground, there would be no danger of the gearing getting out of line, causing it to cut or bind in the boxes, which occurs with other Harvesters in which the gearing is more scattered.

We have succeeded in getting that combination of Lightness, Adaptability and Strength which is the result of thought and skill, taking from some parts and adding to others, making our Harvester from four to six horses lighter draft, and yet retaining as great strength as the heavest machine manufactured. The Header is very rigid and so balanced and hinged that it is no trouble to save down and tangled grain. A boy ten years of age can manage it.

I wish to call your attention particularly to the separating qualities of my Harvester. The agitators are so arranged that the grain is completely shaken from the straw, and my new AUTOMATIC GOVERNOR on the fan completely governs the blast on the shoe, so that at any speed which the machine travels, the blast will be the same, making a saving of a great amount of grain that would otherwise be blown over the riddles; but, instead, will go into the sack, which in a season will more than pay the harvesting expenses, over and above any **Combined Harvester** that has not the **Automatic Governor.**

Each **Harvester** has one of my celebrated **Grain Cleaners** attached, which needs no recommendation from me, as the grain growers of California can testify as to its merits and superiority over other Cleaners on the Coast.

Every machine is thoroughly tested before it is allowed to leave the factory, so there will be no trouble or vexatious delays in the field.

They cut, thrash clean, and sack grain for less than $1 an acre, against $3.50 an acre the old way of heading and thrashing. They require three to four men and fourteen horses for a 14-foot cut, and an additional horse for every additional foot cut.

Please call at my Works, near the Depot, San Leandro, and examine our Harvester. I have sample machine belted and attached to the power of the factory, and will take pleasure in showing how it works, so that you can become familiar with the working of the machine before taking it into the field.

I also desire to call your attention to my latest improved Cleaners that I make for any and all Combined Harvesters. The great success I have had with my Cleaners, made to run with Thrashing Machines, as well as the satisfaction given by my Fanning Mill and Warehouse Mill, induced me to design and build a Cleaner, especially for the Combined Harvesters. I make the following sizes, viz.:

45-inch for 18-foot cut and over.
40-inch for 14 to 18-foot cut.

This Cleaner is the most successful Combined Harvester Cleaner ever offered to the public, and I can guarantee it to be the most perfect Cleaner now in use. I have made a great many valuable improvements that have never yet been introduced, the merits of which will be quickly understood and highly appreciated by those who have use for the Cleaner. It is made strong and durable, and of such size and capacity that it will easily handle and thoroughly clean the grain as fast as any Combined Harvester will thrash it, and it has proven to be the only Cleaner, mounted on Harvesters, that will thoroughly clean foul grain and make it merchantable.

Write for Circulars. For further information, prices, etc., address

DANIEL BEST, San Leandro, Alameda Co., Cal.

Pit Pumps for Deep Wells.

Deep-well pumping is one of the things that has been very greatly perfected in this State. The water-raising apparatus has been improved in order to admit of profitably lifting water for irrigating purposes, and for more valuable crops it is sometimes raised 100 feet. Centrifugal pumps are largely used, because where the water is drawn from sand and gravel, more or less of these substances come into the barrels of ordinary pumps and cut them out. There are plenty of good piston pumps, of course, but there are objections to them for irrigation purposes. The centrifugal pumps themselves were at first only applied for low lifts, and it was a common opinion in this and other countries they would only be employed up to lifts of 40 feet or so. The reason of this was that the mechanical impact of the runners, or the rotative energy of the water, was regarded as a principal factor on the pump's effect, and this effect diminished as the relative speed of the runners and the water.

This difference increases as the hight, that is, the speed of the runners, has to be increased accordingly while the flow of water remains the same. At 10 feet the effect of rotative energy is more than a third, at 50 feet it entirely disappears, or ceases to be a factor that need be regarded.

The engraving on this page shows a centrifugal pit pump for raising water from wells. The pumps are arranged on a new method, the suction-pipes entering at the top of the pump, so as to be easy of access. The water being drawn into the top of the pump causes an upward thrust equal to the work, balancing the weight of the driving shaft, so the whole is in equilibrium. The pumps are made single, or compound with two runners, as the hight of the lift may demand, single runners being recommended for lifts to 50 feet, and compound pumps for higher lifts. The compound pumps with two runners run 40 to 60 per cent slower than single pumps, and avoid the excessive speed required for high lifts. The shafting, couplings and bearings are of a special kind, made for the purpose, and of such weight as to balance the water column. These pumps are made from 2½ inches to 12 inches, the casing being strong enough to withstand a pressure of 50 pounds to an inch of area.

A plant similar to that shown in the engraving on this page, having a capacity of 2,000,000 gallons each 24 hours, with a lift of 57 feet, was furnished the California Nursery Company, at Niles, not long since, by the San Francisco Tool Company, of this city, makers of these pumps. A second one has just been shipped to the same parties. Among others of the same kind, the following orders have been filled: One patent pit pump to Henry Bookskin, San Jose, capacity 1,500,000 gallons in 24 hours, lifting the water 95 feet; one to Wm. Farrington, San Jose, with a capacity of 1,500,000 gallons, lifting 70 feet; one to Francis Smith, Santa Clara, with a capacity of 1,500,000 gallons in 24 hours, lifting 50 feet; one to W. A. Aldrich, Aldrich Farm, Athlone, with a capacity of 2,000,000 gallons, lifting 37 feet. They are at present making two compound patent pit pumps for the Alameda Artesian Water Works—capacity, 1,500,000 gallons each every 24 hours, lifting 75 feet.

From these few instances it will be seen that these deep-well pumping plants furnished by the Tool Company are of good capacity and can lift the water higher than it was formerly supposed that centrifugal pumps could.

Stockton Notes.

[Written for the RURAL PRESS by MRS. W. D. A.]

Heavy dews keep the grain moist, though no rain has fallen since March 3d, and the warm weather has brought up late sown, clean and fine. All grain is growing remarkably fast.

The month has been still, sometimes hot, and now that the new moon of the 24th brought no rain, but a damp wind, people anxiously look for the spring showers and predict no wheat, only on summer-fallow. Sacks are correspondingly low and so are the hearts of some who made little last year. Everything a farmer has to sell is low. Beef, butter and eggs pay little to the hand that sends them to market through this spring. To offset this, clothing and groceries are low.

Frost made gardens late, but since the heat of March, peas come forth in ten days and turnips in six. Quick soil-work! Green peas are in the market. Birds made havoc with early cabbages.

A great many small vineyards and orchards have been put out, and some large ones, that are doing finely. One man bought some vineyard land, set it to vines, and then sold so as to make $1200 on his bargain. The best of vineyard land can be bought for $75 or $95 an acre. On the Calaveras river a man cleared $200 on a half acre of peach trees three years old—more than from a 60 acre field of barley. Low ruling of wheat has given fruit-growing an impetus.

This dry year is a grand one for rodents. Squirrels defy smokers, bisulphide, and even skirmish in spite of poison wheat. Bisulphide is most effectual when the ground is wet; smokers don't kill many.

The courthouse plans will soon be back from Detroit, then work will begin. The granite will come from Penryn and the bricks from Acampo, and a 12-foot fence will keep outsiders from giving advice and comments while the 2½-years' work progresses. The $30,000-pavilion will be commenced at once under the active board, with Mr. Shippee at the head.

Stockton, March 26, 1887.

S. F. Girls' Union.

Its History and the Work Before It.

To afford aid and direction to young women who are homeless or strangers on this coast, the "Girls' Union" was started by a few individuals in the spring of 1884.

The first step, after the incorporation of the society, was to secure a house and establish a home; for the projectors were keenly sensible that a true home-life is the saving of woman. The great need of such an institution was at once made clearly manifest, for no sooner were the doors opened than worthy girls and strangers filled the house, claiming the interest and personal co-operation of those in charge; and every succeeding month has gone to strengthen the conviction of its necessity and usefulness.

The second line of work proposed was extending aid, through a "Business Bureau," to the self-dependent. Scores of bright girls, well-educated and equipped for places in the educational or business ranks, come to us; but for such, with a few exceptions, we have been unable to find even standing room in the positions sought.

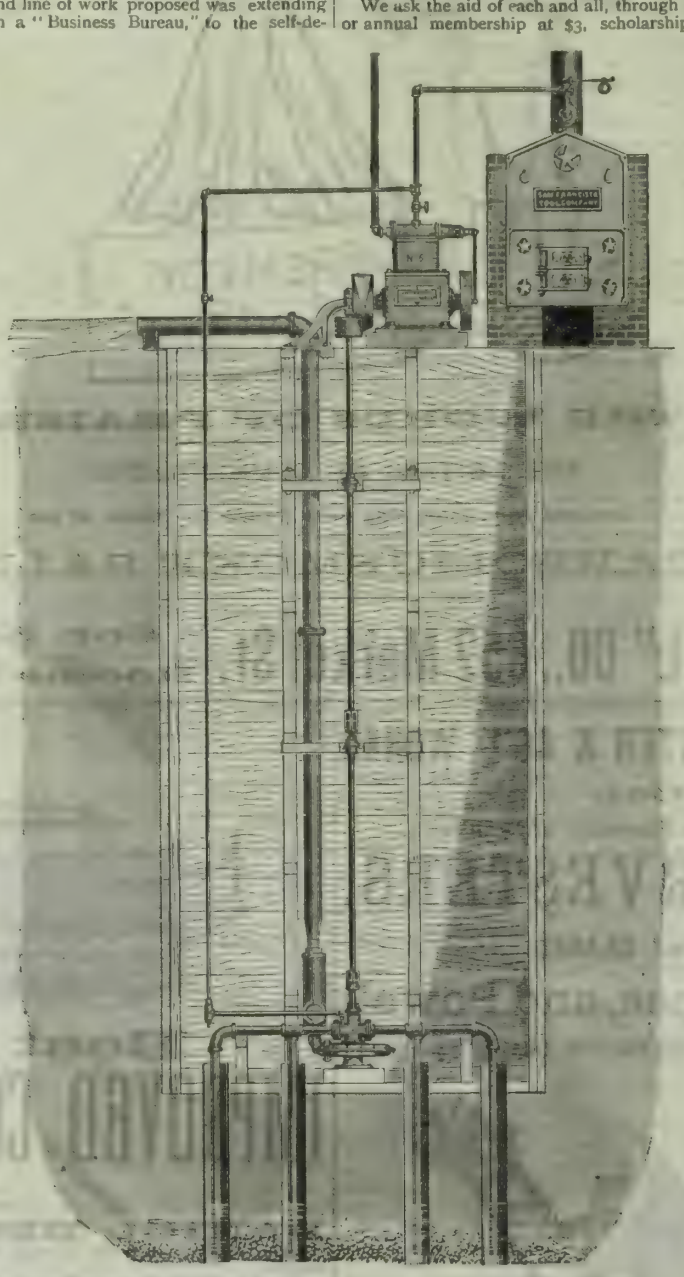
But these are outnumbered ten-fold by those who seek for manual work, but alas! fall short of the required standard of proficiency. Nearly 600 out of 1000 applicants, the last 18 months, have gone through the sieve. This condition of ignorance and inefficiency, however it may be accounted for, and whether it be willful or involuntary, is the most fruitful source of want and possible degradation with which we have to contend.

The grave question confronts the people of our State to-day: What are we to do with the boys and girls of California who have no definite aim in life, no habits of industry nor training for practical pursuits? However proud we may be of our free schools' excellence, far better leave to corporate and individual enterprise the cost of all above the grammar grade, than have the State neglect the manual training so necessary to three-fourths of her youth, unable to find foothold in the overcrowded ranks of mental and clerical laborers.

The sanction and aid of the State in the establishing of industrial training schools would go far toward removing false sentiment as to the respectability of all honest callings, encourage to the attainment of skill in every branch of manual work, and bring success to our domestic, rural and mechanical industries. We believe that primary industrial education should form part of the regular course in all schools supported or assisted by the public moneys. Then if the State (either independently or through societies working in this line) would take up and carry on this training until each pupil was master of his or her vocation, we should have struck at the roots of poverty, misery, vice and crime.

With the burden of this industrial question upon us, we come before the public. Let the testimony of the hundreds of girls already assisted by the Union declare whether or not it has earned the right to live and go on growing. Let business houses and families in city and country testify as to the average intelligence, aptness, conscientiousness and loyalty to duty which characterize its accepted beneficiaries.

The Union is allied to no sect in religion, to no clique in politics. It antagonizes no other organization, and no other is attempting to do just the same work, making a specialty of domestic education, while seeking to develop the highest type of social and moral character. Thus occupying a unique spot in the progressive work of this metropolis, it needs the sympathy and substantial co-operation of all good citizens, until it becomes quite self-supporting and a permanent factor in the best and purest life of the community. Fifty thousand dollars is wanted for building and equipments, to place the Union on a sure foundation. The generous offer of Mr. E. W. Steele (conditioned on our raising the above amount) puts within our reach the choice lot which we now occupy.



We ask the aid of each and all, through influence, or annual membership at $3, scholarship of $25, life membership of $50 or upward, according to their several ability.

Is any demand more urgent, or any object more worthy? Can the public be better served than in giving young women and girls opportunities for developing moral and material strength, and for intelligent self-support, and in supplying our homes and factories with a class which shall bring to our industrial pursuits skill, loyalty and conscientious energy?

What will *you* do for one to promote its success and insure its prosperity?

Any inquiries or communications respecting the Girls' Union may be addressed to

MRS. C. E. KINNEY, Resident Director,
714 Bush St., S. F.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents to DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING MARCH 22, 1887.

359,764.—PUMP—L. L. Bettys, Mountain View, Cal.

359,674.—ORE CONCENTRATOR—F. A. Herring, Reno, Nev.

359,929.—SNAP-HOOK—Kinsley & Heusser, Taylor, Nev.

359,930.—WINDMILL—J. N. Knox, San Jose, Cal.

359,974.—LAMP REFLECTOR—J. Levy, S. F.

359,932.—CAN-LABELING MACHINE—A. J. Lockhart, Marshfield, Ogn.

359,981.—UMBRELLA DRIP CUP—A. G. Nygard, S. F.

359,886.—FRUIT JAR—Jos. Perkins, S. F.

359,640.—RAILWAY CAR—C. W. M. Smith, S. F.

359,650.—WASH-BOILER—H. H. Tuttle, S. F.

14,177.—TRADEMARK—Eureka Packing Co., Eureka, W. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Our Citrus Fair Extra.

In regard to our Citrus Fair edition, the San Jose *Mercury* of the 19th inst. has the following:

The PACIFIC RURAL PRESS has issued a special 36-page edition, mainly devoted to San Jose, and containing besides a large amount of reading matter, some very well executed pictures of the Citrus Fair, and of a number of the schools, business blocks and private residences of the city. A special feature of the edition is a collection of cuts of some of our leading citizens, such as Mayor Breyfogle, B. D. Murphy, Tyler Beach, C. T. Ryland, James A. Clayton, and Cyrus Jones. These pictures are remarkably true to life. The reading matter of the edition referring to Santa Clara county is from the pen of H. M. Hamilton, of the Empire-street school.

How to Get Strong.

Dumb-bells and horizontal bars, Indian clubs and the trapeze are valuable under certain conditions, but they are detrimental rather than beneficial if the blood is poor and thin and poisoned with bile. Use of the muscles necessitates waste as well as induces growth. If the blood does not carry sufficient nutritive material to repair the waste, loss of strength necessarily follows, and growth is out of the question. Purify and enrich your blood with Dr. Pierce's "Golden Medical Discovery," and then exercise will develop and not consume your physique.

A Peck of Peas (P's).

Here are a Peck of Peas, sweet Peas, if you will. Perseverance, Patience, Promptness, Proficiency, Push and Politeness. Add to these Dr. Pierce's "Pleasant Purgative Pellets" and you will get well through the world without much trouble. The Pellets prevent constipation and surplus of bile, which lead to many different complaints. Inclosed in glass, always fresh, entirely vegetable, prompt, and perfectly harmless. Any druggist.

Dr. Sage's Catarrh Remedy surpasses all.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, promote a useful enterprise, and, at the same time, earn a good, honest living. Apply to Dewey & Co., 220 Market St., S. F.

P. S. Readers of this notice can help our common cause by informing persons, likely to become good agents, of this chance.

TO THOSE WHO CONTEMPLATE TAKING UP THE BOOK BUSINESS, we wish to say that we are prepared to do better by them than any other house can afford. We carry the finest line of popular subscription books on this Coast, and by a system of training, can make a success of the most inexperienced. Book Agents, we ask you to look into this. Address for terms, books, and territory, BANCROFT & CO., 607 Market St., San Francisco.

Liberal Religious Literature.

Views, Opinions and Sentiments of Eminent Writers on Religion and its Relation to Man and Society. Address MISS HARRIET KELSEY, Sec'y, Unitarian Church, San Francisco. Correspondence invited.

THE *Golden Era* has been moved from San Francisco to San Diego, where it will be published under the title of the "Coronado Illustrated Magazine."

A Free Gift.

Any lady living in any town where the Le Boi des Savon, the King of Soaps, is not sold, can obtain a bar for trial by sending her name to the Capital Soap Co., Sacramento.

HARDWARE and AGRICULTURAL IMPLEMENTS.

THE TIGER SULKY RAKE.

THE TIGER RAKE has been awarded FIRST PREMIUMS at the most important field trials of Hay Rakes in America and Europe.

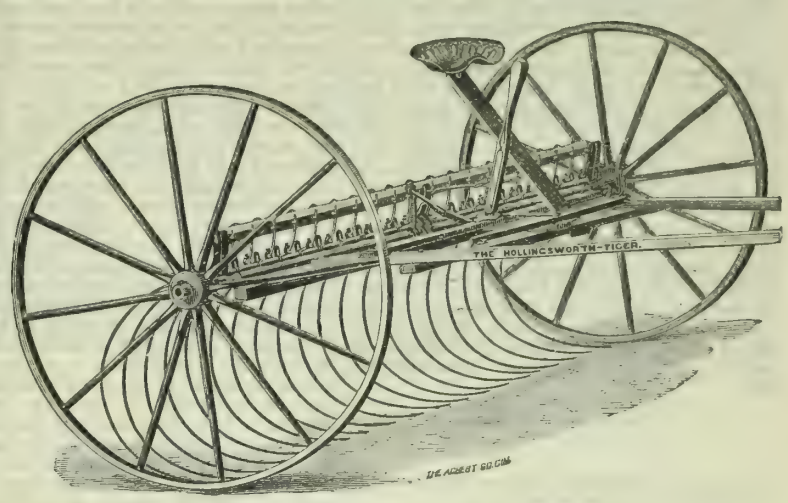
In the ten years it has been before the public it has distanced all its competitors, and its sales are now double that of any other rake manufactured in the world.

It is the ONLY HAY RAKE in actual use that has proven itself strong enough to stand all the tests of a Self-Dump Horse Hay Rake. It is the BEST RAKE EVER PUT UPON THE MARKET, both for the superiority of its work, its unequaled construction and durability, and the variety of work to which it can be applied.

THE TIGER belongs to that class which are termed "self-operating" or "horse-dump" rakes. In rakes of this class, the labor of discharging the gathered load is transferred to the horse, instead of devolving upon the driver, and the latter is, therefore, relieved of the work which in hand-lever rakes is always more or less arduous.

The discharge is accomplished by simply pressing the foot upon a chain conveniently arranged for that purpose, and the teeth are thereby locked to the rotating axle, and after being tilted and the contents discharged by the movement of the horse, are automatically released and resume their work.

The vital point in every rake is the Steel Teeth. The manufacturers make their own, and are the only Horse Rake manufacturers in the United States who do this. Having found, from long and bitter experience, that it was impossible to rely upon a uniform quality and temper of Rake Teeth obtained from steel manufacturers, they have erected their own Steel works for making and tempering Rake Teeth, and with the best appliances for that purpose, and skilled workmen making nothing but Rake Teeth, we can assure all who purchase our Rakes that they can rely upon these steel teeth being of uniform quality and temper, and that they will stand the severest usage.



The teeth run lightly on the ground, and are easily adjusted, at the will of the operator, to any desired position, and will rake heavy green hay as well as light.

We trust that no one will be deceived by the many imitations of the Tiger Rake, on the representations of the agents for them that they are "just like the Tiger," or the "Tiger improved."

Buy the GENUINE TIGER, with our name on it, and you will make no mistake.

PRICES REDUCED FOR 1887.

THE HOLLINGSWORTH-TIGER RAKE.

THE HOLLINGSWORTH-TIGER RAKE

Is so called because it is a COMBINATION OF THE BEST AND DISTINCTIVE FEATURES which have made the "HOLLINGSWORTH" and the "TIGER" rakes the two most popular and successful hay rakes ever introduced.

It takes from the Hollingsworth its rocker frame and peculiar shaped tooth, with its spiral spring attachment and ready adjustability to every variety of work, and unites with it the iron revolving axle and dumping device of the world-renowned "Tiger." Any one familiar with the merits and characteristics of these two rakes will readily see the advantage of this strong combination, and will be ready to admit our claim that it is the

"NE PLUS ULTRA" OF HAY RAKES.

We have for many years manufactured on a very extensive scale both the Hollingsworth and Tiger rakes. Over 100,000 of them scattered all over the world, in Europe, in Asia, and in Africa, as well as in every State and Territory in the Union, attest their remarkable success. We are justly proud of their record and the reputation we have made for them, and now, in offering the "HOLLINGSWORTH-TIGER" as a new candidate for popular favor, we do so with confidence that this COMBINATION OF TWO OLD FAVORITES will meet with a warm reception and popular favor.

Remember then we claim that the HOLLINGSWORTH-TIGER is the very best hay rake you can buy, and also has, at a trifling additional cost, AN ATTACHMENT THAT WILL ANSWER A BETTER PURPOSE THAN THE HAY TEDDER, which is an implement that is rapidly coming into general use.

SEND FOR REDUCED PRICE LISTS OF ABOVE RAKES.

Address BEACH & CO., RICHMOND, IND.

THE STANDARD MOWERS.

The Only Successful and Practical

WIDE-CUT MOWERS.

The entire weight of the Cutter Bar being suspended on the Spring prevents the Bar from dragging on the ground, thus doing away with all side-draft and enabling us to use a 7-foot bar, thereby accomplishing a feat which cannot be done by other machines.

It has more cutting power, because nearly the whole weight of the cutter-bar and the inside and outside shoes is carried on the drive-wheels, thereby increasing the "*Traction*" more than enough to make up for the additional length of the knife.

The 7-foot Mower is as Light Draft and as easy to handle as any 4-foot Cut Mower made.

Remember with two horses and one man the 7-foot Mower will cut 20 acres of grass per day.

SIZE OF MACHINES:

4 Feet 3 Inches, 6 Feet, 7 Feet.

Send for Circulars.

FARMERS' UNION,

San Jose, Cal., Agent for California.

RURAL HEALTH RETREAT,

ST. HELENA, CAL.

This delightful Resort has been fitted up as a Sanitarium, and offers unrivaled advantages to **Tourists and all Classes of Invalids**, both for winter and summer. It is situated on the southwestern slope of Howell Mountain, a locality of enviable reputation for health-recuperating qualities, about 1200 feet above tide level, 500 feet above and overlooking the beautiful **Napa Valley**, and 2½ miles from St. Helena.

Its Natural Advantages

Are equal to those of any other health resort. It is noted for its Pure Water, Dry Atmosphere, Clear and Balmy Sunshine, Even Temperature, Mild Breezes, and the absence of high winds.

Our Remedial Measures

Include **All Forms of Baths**, Vacuum Treatment, both local and general; Galvanic and Faradic Electricity, Mechanical Appliances, and Exercises for the Development of the Lungs, Vital Organs, and Muscular System, and **Cure of Deformities.**

The Rational Treatment

By known remedial agents is employed. With these natural and acquired advantages, pleasant and desirable surroundings, thorough and judicious treatment and wholesome diet, most invalids who avail themselves of these agreeable facilities, rapidly recover.

The Retreat is under a thoroughly competent director, and patients have the care of two regularly graduated physicians of experience, who are assisted by well-trained and courteous gentleman and lady assistants.

All Invalids and Tourists may feel assured that they will be courteously received and kindly cared for.

For Circulars and further particulars, address

THE FIELD.

Wheat Cultivation in India.

We condense the following account of wheat cultivation in India and its cost from the pen of Martin Meyers, a recent correspondent of the *Call* of this city:

British India—Hindostan, the locality from which the English derive their supply of India wheat, is a vast area of level country—as level and monotonous in every direction, for thousands of miles, as the San Joaquin valley in this State. Throughout this region there are populous cities at intervals of from 50 to 80 miles apart, and compact villages from three to four miles apart. There are no isolated farms, as with us, no fences except along railway tracks. In each village there are a few landholders, not landowners, who either cultivate the land on shares or on their own account. They raise wheat, rice, corn, sago, etc.; but all the wheat is grown inland—none nearer the sea than 200 miles. Wheat is grown as a second crop, following corn, sago, etc., and is always irrigated. The correspondent above named divides his subject of wheat culture into that of planting, irrigating, harvesting and transportation. He requests his readers to remember that the bhigah is the standard of area, the maund the standard of weight, and the rupee that of current coin, also that 12 pie make one anna, and 16 annas one repee. And further, that

40 bhigahs make 25 acres.
1 maund equals 80 pounds.
1 anna equals 3 cents.
1 pie equals ¼ of a cent.

First to be considered, then, is the planting. For this we will allow as follows:

	Per acre.
Seed wheat, say 1 rupee or 16 annas, equals	48 cents
Plowing, sowing and harrowing—	
3 yokes of oxen at 5 annas, 15 annas, equals	45 cents
4 coolies at 2 annas, 8 annas, equals	24 cents
Hoeing into beds—	
2 coolies at 2 annas, 4 annas, equals	12 cents
Total cost per acre	$1 29

The seed is sown broadcast, the ground plowed with a wooden plow or crooked piece of acacia trunk, and is harrowed as often by a thornbush as by anything else, drawn by a pair of not over-fed bullocks, and guided by an almost naked coolie, while his clean-shaven cranium, turbanless, is proof against the scorching rays of an Indian sun.

Second—Irrigation—For the purpose of irrigation, the land is subdivided into patches of about 25 acres, in the midst of which stands a well 10 or 12 feet in diameter, the water being from 40 to 60 feet below the surface. Around this favored spot are reared a few huge banyans and other useful trees to shelter the workmen from the heat of the sun. The water is raised by a pair of bullocks hitched to a beam working a horizontal wheel of about 10 feet in diameter, with wooden cogs on its upper outer edge, which are geared into similar cogs or pegs on a vertical wheel on the outer edge. On this vertical wheel swinging loosely from the top and leading down to a few feet under the water—the wheel being directly over the well—is an endless rope, or rather a rope-ladder with wooden rounds about 15 inches apart. Each round or rung carries an earthenware vessel holding about half a gallon of water, which it tilts over into a trough on top as each vessel is in turn raised to the surface by the rotation of the wheel. This, the "Persian wheel," as it is called, is the general and the only mode of irrigation throughout the country, except the canals constructed by the East India Company.

The landholders in the Punjab pay about one dollar per acre for the use of water from the Government canals—they having to construct their own sub-ditches from the distributing canals.

To irrigate, then, 25 acres by the Persian wheel system, three yokes of oxen and three coolies are employed without intermission for four months, day and night.

3 yokes of oxen, working 8 hours each, at 5 annas, 15 annas, equals	45 cents
3 coolies at 2 annas each, 6 annas, equals	18 cents
Total	63 cents

That is 63 cents per day for 120 days—$75 60 for 25 acres; and dividing this sum by 25 we get $3.02 per acre.

Now we come to harvesting. All hands, both male and female, of ages from 9 years to 90, turn out the harvest, and are to be seen with their curved reaping hooks of a very primitive style, half squatting on their hunkers, in long lines cutting away at an apparently interminable stretch of wheatfield, and frequently the quantity cut during one day is carted to the well or farmyard the next. Also by an old Sikh law—not an English one—each hired coolie is entitled to all he can pack on his back of wheat sheaves as his portion of a share in the soil, no matter who owns the crop, and avails himself of the privilege at the end of each day's work. The winnowing is done in the open air by a sieve in the old style, so we can get the approximate cost per acre, as follows:

	Cents.
Two hired coolies will cut 1 acre at 2 annas a day, 4 annas, equals	12
Cart 1½ to sell, 3 annas, equals	9
Threshing, 12 bullocks, treading out the grain, biblical style, around a ring, at 1½ annas, 18 annas, equals	54
One coolie to drive, at 2 annas, equals	6
Winnowing, 1 man and 1 woman, at 2 annas, 4 annas, equals	12
Fifteen wheat sacks, at 1 anna, 15 annas, equals	45
Total per acre	$1 38

Lastly, let transportation be considered. For the purpose I will take wheat from the country between Allahabad, on the Ganges, and Loodiana, on the Sutlej, 700 to 1000 miles. The chief ports of export are Calcutta, Bombay, Madras and Kurrachee, all of which are termini of great trunk lines of railroad, while to the first, Calcutta, float on the bosom of the mighty Ganges immense piles of freight; to the latter, Kurrachee, the river Indus, flowing through an unsurpassed wheat belt, conveys a fair proportion of the export wheat of India. But in competition with this cheap and excellent means of water transportation is the vast and efficient system of East India railways, which, like the Canadian Pacific, being built from the revenues of the State, belongs to the people themselves, and is operated under a schedule of fares and freights just sufficient to keep the permanent way in order, rolling stock in trim, and defray the current working expenses. Thus the grain dealers of each local market in the interior are enabled to transmit to the seaboard their produce far cheaper than could be expected in countries where labor is higher and where the above-mentioned advantageous conditions do not exist. The classification of freight is much the same as with us, but the scale for distances is graduated so as to give a cheaper rate per mile for long than for short distances, as, for instance, when wheat is carried a distance of 500 miles for one-ninth of a pie per mile per maund, it would be carried a distance of 900 miles at one-twelfth of a pie per maund per mile, and so on—*i. e.*, for one pie one maund (80 pounds) is carried 12 miles, or for one pie 100 pounds is carried 9 3 5 miles, and for 100 pies 100 pounds is carried 960 miles; that is, for 25 cents we get 100 pounds carried 960 miles, or $5 carries one ton over 960 miles. But as our object is to find out the cost of one cental laid down at port, we will have to take this 960 miles as the average distance, and also allow 22 bushels of 60 pounds each to be an average yield per acre, this being about the mark as far as my observation has enabled me to judge; then, by adding the three foregoing items together, we have:

Planting (per acre)	$1 29
Irrigating (per acre)	3 02
Harvesting (per acre)	1 38
Total (per acre of 22 bushels, or 1320 lbs.)	$5 69

And $5.69, multiplied by 100 and divided by 1320, gives for planting, irrigating and harvesting a cost of 43 cents per 100 pounds; for transportation 960 miles, 25 cents per 100 pounds. Total cost laid down at port, 68 cents per 100 pounds.

Again it may be urged that 960 miles is too great an average distance; to this I reply that wheat can be raised cheaper in the Punjab than near the coast, and of a far better quality. The ratio given and wages quoted are those in existence in 1860, and I have known the best of farm hands employed by the month for $1 and board. But the general tendency of laborers' wages in that country is to rise, so wheat can never be produced in British India at a less figure than that above arrived at, namely, 68 cents per cental.

Our wheat has to go in sailing vessels around Cape Horn—and theirs in the same kind around the Cape of Good Hope. They may ship via Suez, but allowing for tolls it is doubtful if it could be done any cheaper. If it can, when the Panama canal is opened, we would have a like advantage.

Progressive people will naturally ask if the length of time since 1860 has not operated to create a new order of things and effect a great change in prices. Not materially, I think, for the reason that the natives, both Mohammedan and Hindoo, are fanatically attached to caste and are scrupulously opposed to innovation of any kind, its teachings being to do all things precisely as did their fathers, grandfathers and greatgrandfathers. Although I have not been to the Punjab since 1860, in 1870 I visited Calcutta to dispose of my interest in a tea plantation in Upper Bengal. We had there 300 coolies employed at the same old wages, viz.: three rupees per month, and they worked long hours and boarded themselves out of that. Still, as I said before, the tendency of wages would be to rise, while that of transportation would be to get cheaper, say 10 per cent each way, which would leave the rate of 68 cents per cental practically unchanged.

One Cent Invested

In a postal card on which to send your address to Hallett & co., Portland, Maine, will, by return mail, bring you free, particulars about work that both sexes, of all ages, can do, and live at home, wherever they are located, earning thereby from $5 to $25 per day and upward. Some have earned over $50 in a single day. Capital not required; you are started free.

TIME IS MONEY.—This old adage is peculiarly applicable to farm work, for not only is the time spent in work lost by waste of it, but the possible results of the time so spent are lost with it. A poor tool leads to waste of time, for when a farmer spends a month plowing and harrowing 20 acres with the ordinary implements, which he can do with the "Acme" Pulverizing Harrow, Clod Crusher and Leveler in a week, he clearly loses three weeks of time with all the profit he could make for these three weeks of work. As this implement covers six feet of surface and plows and turns and harrows and pulverizes the soil at the same time, the saving of time and labor is clearly unquestionable. This is a most important consideration in the hurry of spring work. See advertisement on page 302.

The New Text-Books.

The bill respecting the distribution of the State series of school text-books, passed by the Legislature and approved by the Governor, provides that all orders for text-books shall be made on the Supt. of Public Instruction, and shall be accompanied by cash, in payment for the same, at the price fixed by the State Board of Education as the cost price at Sacramento; *provided*, that if the books are to be shipped by mail, the cost of postage shall also accompany the order.

The following persons shall be entitled to order books:

1. County Supts. of Schools, for the use of teachers, parents and pupils in their counties only.

2. Principals of State Normal schools, for their own and for the use of the pupils in their respective schools only.

3. The Secretary or Clerk of any school district in the State, whether incorporated or operating under the general law of the State, for the use of the pupils in such district only; but no books ordered by the County Supts., or Clerks of District Boards of Trustees, or Principals of State Normal schools, shall be sold at a price exceeding the cost price at Sacramento, with the actual cost of freight and cartage added.

4. Any retail dealer who shall first transmit to the State Supt. of Public Instruction an affidavit duly subscribed by him in substance as follows, to wit: "In consideration of receiving for sale, upon the inclosed or upon any future order, the series of school text-books, or any part thereof, published by the State of California, I hereby agree that I will not sell the same to any person or persons for the purpose of being sold again, or to any person or persons beyond the limits of the State of California, and that I will not sell said series of text books, or any part or portion thereof, at a price exceeding the price to the pupil fixed by the State Board of Education."

Said affidavit shall be indorsed by the County Supt., in the following words, viz.: "I hereby certify that A. B. is a regular retail dealer in school-books in this county. C. D., County Supt."

It shall be the duty of the State Supt. of Public Instruction to furnish at once to each County Supt., for the use of any dealer in his county who may apply for permission to sell the books of the State series, printed copies of the above affidavit, together with the list of prices of such books fixed as the cost price at Sacramento, and the price to the pupil; and any dealer who shall fail to comply with the conditions of such affidavit shall forfeit his right to any further purchase of said books from the State.

It shall be the duty of the Boards of Supervisors of the counties, or cities and counties, in this State, to provide a revolving fund, for the purpose of enabling the County School Supts. to purchase the State text-books; all moneys to be taken therefrom to be replaced by the moneys received from the sale of said books to the scholars of the public schools of his county, either by himself, or by the teachers of the public schools, or the Clerks of Boards of District Trustees.

All school books compiled by the State shall be furnished to the public school-children of the State at the cost of printing, publishing and distributing the same, said cost to be ascertained and fixed by the State Board of Education on or before the 15th day of June of each school year; and it is further enacted that the cost of distribution shall be taken to be cost of postage required for mailing each book.

The price list has been fixed by the State Board of Education as follows:

First Reader, at Sacramento, 15 cents; by mail or purchased from bookseller, 20 cents.

Second Reader, at Sacramento, 30 cents; by mail or purchased from bookseller, 38 cents.

Third Reader, at Sacramento, 40 cents; by mail or purchased from bookseller, 52 cents.

Speller, at Sacramento, 20 cents; by mail or purchased from bookseller, 26 cents.

The above prices were fixed by the former State Board of Education. Supt. Hoitt thinks that the board at its next meeting will make the price of the Second Reader to the pupil 40 cents, instead of 38 cents, and of the Third Reader 50 cents, instead of 52 cents, thus making the cost of a set the same as now, but the price of each book a multiple of five.

The dealers will make the difference between the cost of freight and postage; and the consumer who buys his books of the dealer will save a two-cent stamp required to send his order to Sacramento and the cost of a postal note or money order. If the people of any district prefer to send, through their clerk, direct to the State Supt. for their books, they have that privilege. It would seem that not only will the people be protected, but accommodated by the plan of distribution adopted.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

For Gout, Rheumatism, Neuralgia, Sciatica, bathe the parts affected freely with Perry Davis' PAIN KILLER taking also a teaspoonful in sugar and water 3 times a day, and you'll get relief at once and a Cure after faithful use of this remedy. Pain Killer Cures Coughs, Colds, Sore Throat, Diphtheria, Frost Bite.

HALL'S SARSAPARILLA

Cures all Diseases originating from a disordered state of the BLOOD or LIVER. Rheumatism, Neuralgia, Boils, Blotches, Pimples, Scrofula, Tumors, Salt Rheum and Mercurial Pains readily yield to its purifying properties. It leaves the Blood pure, the Liver and Kidneys healthy and the Complexion bright and clear.

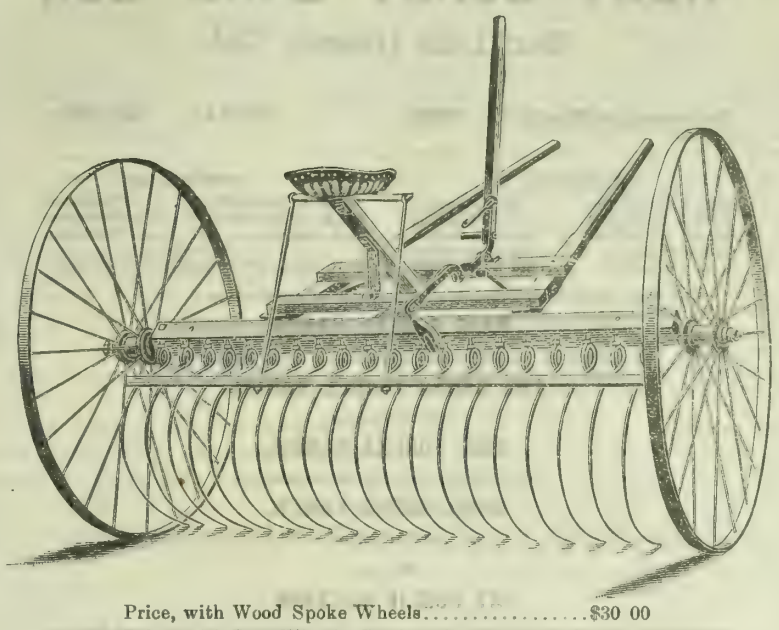
—SOLE AGENTS FOR—



THE "RELIABLE" SULKY RAKE.

The cut shows our new "RELIABLE" Rake, which has been built with a view especially to furnish a Rake which shall be superior in construction, handsome in finish, easy to operate, and very substantial. In building this Rake, nothing but first-class material and workmanship have been employed. In its vital features, as well as in its minor points, nothing has been done to avoid expense. Every piece which enters into its construction fills its especial place, because it was THE BEST OF ITS KIND which could be used. An examination of the "RELIABLE" will convince the most skeptical that it combines all the advantages we claim for it.

It is a Complete Lock-Lever Rake.

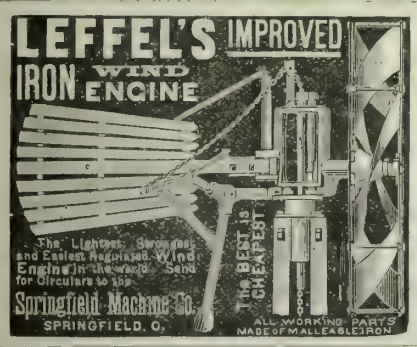
POINTS TO BE NOTED:

DOUBLE COIL SPRING STEEL TEETH.—The Teeth are made of refined cast steel, tempered in oil, and weigh 45 pounds per set of 20. Every one is tested at the factory, and is warranted. By our method of attaching these teeth they retain the highest degree of elasticity, thus enabling the rake to pass over uneven surfaces and obstructions without detriment to its work or damage to the implement.

Price, with Wood Spoke Wheels.....$30 00
Price, with Iron Wheels, Steel Spokes..... 35 00

EACH TOOTH is fastened to the Rake Head by an independent bolt, and may be removed in less than half a minute without disturbing any other.

WROUGHT IRON TURNED SPINDLES.—The Axles are of wrought iron, and TURNED TO A BEARING where they enter the wheel hub. This feature is possessed by no other Rake, and is an especially valuable one, as it decreases the wear on both spindle and hub, and makes the Rake very light of draft.



EASE OF DUMPING AND LEVER.—The Rake Head proper, as shown in cut, sets higher than the spindle, so that the least tilting of the Lever dumps the Rake by the weight of the operator. The construction of the Lever is such that a very slight pressure of the foot on the treadle, at its lower end, will hold the teeth firmly to their work. This makes it practically a lock-lever, and gives the advantage over a lock-lever that it is not nearly so hard to dump.

SIMPLICITY AND CHEAPNESS.—The "RELIABLE" is entirely free from cog-wheels and gearing and other complicated devices for dumping or operating. It is the easiest dumped Rake made, and is so simple that any child who can drive a horse can operate it perfectly and satisfactorily.

Lands For Sale and To Let.

FARMS FOR SALE!

—BY—

GRIFFIN BROTHERS,

Cottonwood, Shasta County, California.

TITLES ALL GOOD OR NO SALE.

We have 40 inches of rain annually, hence need no irrigation and have no law-suits about water rights. Plenty of wood and water. Good schools, good society, cheap land, the best of soils, and local markets for all products. No snow, no blizzards, no black gnats, no damage from north winds, no chills and fever.

No. 49.

$3000 —A well improved 160 acres, 10 miles west of this town, on Cottonwood Creek. On public road. New dwelling, only 10 rods to school house; no hills. Forty acres cleared; some good bottom land. U. S. title. Terms cash. Crop goes in.

A FINE RURAL HOME. No. 67.

$25,000.—1085 acres 2 miles from Cottonwood, and fronts on a never-failing stream. About 500 acres of the finest quality of dark, deep, alluvial land that will produce corn, alfalfa, wheat, vegetables or crops of any kind; has yielded 7000 bushels of wheat in one season, besides other crops. The balance of the farm is rolling woods-pasture. On the bottom land are two orchards and vineyard, 3 dwelling houses, large barns and granaries that would cost $5000. Several good wells of water. Splendid location for healthfulness and picturesque scenery. All the farming machinery and household furniture; 19 good horses, including a young stallion; 19 head of cattle, mostly cows; and 40 hogs; also sufficient hay and grain to seed the farm goes in with the farm Part may remain against the farm if purchaser so desires.

No. 68. A SUBURBAN HOME.

$7200.—240 acres on Cottonwood Creek, 2 miles from town; all well fenced and cross-fenced; all good land under cultivation; one half is first-class bottom land; good buildings; terms, half cash.

No. 71.

$3000 —800 acres rolling land, finest kind of pasture. Wells can be had for stock water.

No. 70.

$10 per acre—160 acres, perfectly level, grav. second bottom land; 40 acres clear; balance has some brush and oak, but easily cleared. One of the very best locations in Cottonwood valley for Fruits of any kind without irrigation. Terms cash.

No. 78.

Four sections of the best stock pasture land. Rolling hills all covered with grass, on which cattle graze and do well the year round. Plenty of water for stock. This place will be sold very cheap if application is made soon. Title perfect.

No. 74.

$10 per acre.—120 acres good vine land, nearly all cleared, none too rough for work, good house and everlasting spring. U. S. patent. Terms cash.

No. 75.

$10 per acre.—700 east of and on the Sacramento river. All under a good, new wire fence. A never-failing creek crosses the land and furnishes abundance of stock water the year round. About 300 acres level, of which 80 are the finest kind of river bottom land. This bottom land has been under cultivation for several years and produces excellent vegetables.

The WEST COAST LAND COMPANY now offering in subdivisions the

PASO ROBLES RANCH,

Of 20,400 acres, less 6000 acres sold to settlers in the past four months;

THE SANTA YSABEL RANCH,

Of 20,200 acres;

THE EUREKA RANCH,

Of 11,000 acres, and 12,000 acres of the

HUER HUERO RANCH,

All ying in a body, on the S. P. R. R., at its terminus in SAN LUIS OBISPO COUNTY.

Will sell

AT PUBLIC AUCTION

About March 22d (for date see later advertisement) **the balance of the Paso Robles Ranch,** consisting of town lots in Templeton, 800 acres in 5 to 12-acre lots adjoining Templeton, and 14,000 acres in ranch subdivisions;

ALSO,

2100 acres of the **Huer Huero Ranch** in 20 subdivisions.

These are all agricultural and fruit lands, in quality equal to any in the State, with an average annual rainfall exceeding that of Santa Clara county, and require

NO IRRIGATION.

Title, U. S. Patent and to be free and clear of all incumbrances.

TERMS OF SALE.

Lots in Templeton, cash, U. S. Gold Coin. All other tracts one-third cash; balance in 4 equal payments, at 2, 3, 4 and 5 years; interest 6 per cent per annum. The mortgage tax paid by the mortgagee makes the interest about 4 per cent net to the purchaser.

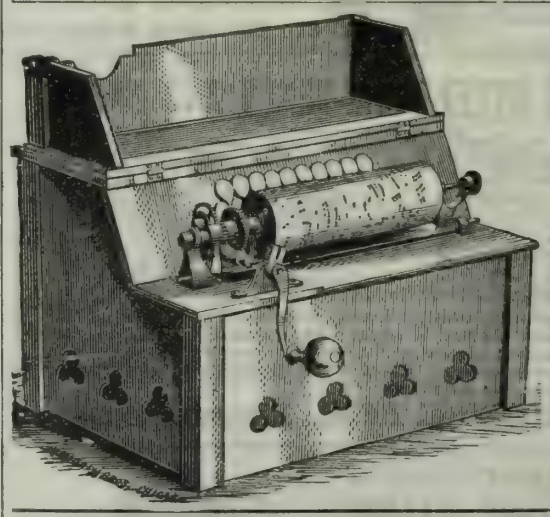
An additional charge will be made of $5, for deed in sale of town lots, and $25 in other cases for expenses of sale, including making and recording all papers.

Schedule price of ranch subdivisions average $20 an acre; of 5 to 12-acre lots, $50 an acre.

SALE WITHOUT RESERVE,

Providing that no bid will be entertained at less than 60 per cent of schedule prices.

Ten per cent of cash payment (but in no case less than $100) required at fall of hammer; 30 days to complete sale. Parties failing for 30 days, forfeit sum paid.



Parties going from Los Angeles take P. C. S. S. Co.'s Steamers from San Pedro to San Luis Obispo. From San Francisco, take 8:30 A. M. daily train, S. P. R. R., to Templeton.

Parties wishing to inspect said lands with a view to purchasing at the Auction, or any of the Company's Land at private sale, will be shown the property free of charge by applying at the Company's office in Templeton.

Maps of all the ranch subdivisions, of Templeton, of the 5 to 12-acre suburban lots, and a general map showing the location of the Company's lands with a new descriptive catalogue are in press and will be sent free on application after the 25th inst. (February, 1887.)

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Railroad Rates.

Freights and Fares Under the New Law.

Pacific Coast producers and shippers have been on the anxious seat ever since the enactment of the Interstate Commerce law as to what the immediate effect would be on rates to and from this coast. The *Morning Call* of March 30th gives the following full information on the subject:

The new western classification by which freight rates are to be permanently regulated after April 4th next came to hand yesterday, and railroad agents are at last in a position to give reliable information in regard to tariffs as they will be under the Interstate Commerce bill. The tariff schedule received last week was simply the first rough division of the various kinds of freights into some ten classes, running from one to five and from A to E, stating also the rates which were to be charged for each class. The new sheet, however, deals directly with the freights themselves without regard to their prices, and, with the old sheet as a basis, completely reclassifies them under the heads from one to five and from A to E. When a merchant, for instance, desires to know at what figure he can import hams and bacons from Missouri-river points, he simply turns to the schedule, and under the appropriate head finds them rated in the second class for lots less than a carload, and in carload lots and over in the fifth class, the rate in the first instance being $2.50 and in the second $1.50. This classification, however, only applies to those classes of freight for which no special rates have been made. In the transportation of beans, canned fruits, etc., for which freight the Pacific Mail competes strongly, special rates have been agreed upon as follows:

Articles In carloads of 20,000 lbs., per 100 lbs.	To Missouri River and Common Points.	To St. Louis and Common Points.	To Chicago and Common Points.
Beans, canned fruits, pickled fish, canned salmon, honey (strained)	1 40	1 50	1 55
Borax, cocoa oil, whale and fish oil, vegetables	1 10	1 20	1 25
Barley	65	72	75

Hops, any quantity, from the Pacific terminals named above, to Missouri-river common points, $1.75 per 100 lbs.; to St. Louis and common points, $1.85 per 100 lbs.; and to Chicago and common points, $1.95 per 100 lbs.

Oranges, in car-lots, from Los Angeles, Cal., to Missouri-river points, $1 per 100 lbs.; to Sioux City, Iowa, and St. Louis, Mo., and common points therewith, $1.10 per 100 lbs.; and to St. Paul, Minneapolis and Chicago, $1.15 per 100 lbs.

This last rate differs but slightly from that made under the old regime. The old rate to Chicago was $1.05, so that there is only here an increase of 10 cents. To Denver the rate is lower by some 40 cents, the rate having previously been $1.40, where it is now $1.

San Francisco merchants have awaited with much interest and anxiety the issuance of the new local rate-schedule upon which the officials of the Southern Pacific have been working most assiduously since the return of J. C. Stubbs and Richard Gray from Chicago. It will be a decided relief for them to learn, therefore, that the interstate law does not alter, save in a few unimportant particulars, the present relationship between the Missouri river and California in respect to Salt Lake City and Ogden.

In reference to the maintenance of the existing trade of California and Colorado, the following special rates for California products have been made from Pacific Coast terminals to Denver, Colorado Springs and Pueblo:

C. L.	Per 100 lbs.
Beans	$1 30
Canned goods	1 30
Fish, pickled	1 30
Lumber	64
Oranges	1 00
Sugar	1 30
Vegetables	1 00
Wine	1 90

For freight train service rates on live-stock between Pacific Coast common points and the places in the table, rates have been agreed upon as follows:

	Rates in dollars and cents per 1000 pounds. Minimum weight per car, 2000 pounds			
	Length of Cars.	Horses and Cattle.	Cattle.	Hogs and Sheep.
Missouri river common points; also St. Paul and Minneapolis, Minn. and Galveston and Houston, Texas.	30 ft.	2.00	1.50	1.40
	33 ft.	2.20	1.65	1.54
	34 ft.	2.27	1.70	1.59
	35 ft.	2.33	1.75	1.63
Mississippi river common points, Dubuque, Ia., to New Orleans, La., inclusive.	30 ft.	2.22½	1.70	1.60
	33 ft.	2 44¾	1.87	1.76
	34 ft.	2.52½	1.92 7-10	1.81 7-10
	35 ft.	2.59½	1.98 3-10	1.86 3-10
Chicago, Milwaukee and points common therewith.	30 ft.	2.30	1.77½	1.65
	33 ft.	2.53	1.95¼	1.81½
	34 ft.	2.61	2.01½	1.87 3-10
	35 ft.	2.68	2.07	1.92 2-10

Another table of considerable interest to both importers and exporters is the table of rates between Missouri-river points and Chicago and St. Louis, which is as follows:

	First Class.	Second Class.	Third Class.	Fourth Class.	Fifth Class.
Chicago	$90	$75	$50	$35	$30
St. Louis	70	55	40	30	25
	A Class.	B Class.	C Class.	D Class.	E Class.
Chicago	$32 50	$29 50	$23	$20	$16
St. Louis	25	22	18	15	12

As far, therefore, as can be judged from present indications, the whole effect of the interstate commerce bill on California freight has been to increase materially rates to Missouri river points and points east thereof, while the rates to local points, though increased, have yet been maintained in much the same relation to those ruling to the same points from the East as in the past.

T. H. Goodman, in conversation yesterday with a *Call* reporter, reiterated his former statement that passenger rates would remain much the same as they are at present. There may be, he said, a few changes to points west of the Missouri, for if any of our connections increase their rates a few dollars, we must make a similar change in our rate schedule. We will issue a new rate-sheet, however, on the 4th prox., but beyond such changes as may occur between now and then it will be substantially similar to that in use at present. In regard to excursions, Mr. Goodman stated that they would be continued at the same rate as at present, namely, $80 for the round trip from Chicago to the coast, and $60 from Missouri-river points, tickets to be good for six months.

The Wine Committee's Report.

A report of the committee of the Wine makers' and Grape-growers' Convention, appointed to sample the wines exhibited, has been prepared as follows:

The total number of samples received was 465. Of these 386 were sampled by your committee. Each member of the committee kept a record of each wine sampled, and on comparing notes we find the following result, which we have tabulated in a concise form. As it was announced in the call for the convention that the wines were not for competition, but for study and comparison, we have refrained from mentioning the names of exhibiting vineyardists and only show the results as to counties. We have made three classes of wines, namely: extra, fine, good. Those that were marked No. 1 by all of the committee are classed as "extra;" those that were marked No. 1 by a majority of the committee are classed as fine types; those marked No. 2 are classed as good types; all below No. 2 are not included in our report.

In all, 29 samples of Zinfandel were exhibited, and two from Alameda were extra, five fine, and seven good; Napa had five fine and two good; Santa Clara, one fine, and two good; Contra Costa and Santa Cruz, each one good. Of the 20 Zinfandel blends, Alameda had one extra, three fine and eight good; Santa Clara, one fine and one good; San Joaquin, one fine.

Of nine samples of Crabb's Black Burgundy, Napa had one fine and one good; Alameda, one fine and two good; Santa Clara, four good.

Of four samples of Beclan, Napa had one fine; Alameda, one fine; San Mateo, one good.

Of five samples of Petit Syrah, Napa had one fine; Alameda, one extra and three fine; San Joaquin, one fine and one good.

Of seven samples of Mondeuse, Alameda had one extra and three fine; Napa, one fine; San Joaquin, one fine and one good.

Of eight coloring varieties, Napa had one extra, one fine and one good; Alameda, one extra and one good; San Joaquin, one good.

Of two samples of Tannat, Alameda had one extra and one fine.

Of six samples of Malbec, Alameda had one extra, two fine and one good; Santa Clara had one fine and one good.

Of 21 samples of Medoc types, Napa had three fine and two good; Alameda, four extra, three fine, and three good; Santa Clara, one extra and one fine; San Joaquin, one extra and one fine.

Of 10 Sauternes, Napa had two extra and two fine; Alameda, five fine; Santa Cruz, one fine.

Of 20 specimens of Riesling, Napa had five fine and three good; Alameda, two fine and three good; Santa Clara, one extra; Sonoma, one good.

Of nine samples of Sauvignon Vert, Napa had two fine and three good; Alameda, two fine and one good; Santa Clara, one extra and one good.

Of seven samples of Burger, Napa had two good; Alameda, one fine and two good; Santa Clara and Santa Cruz, each one good.

Of 18 samples of Chasselas, Napa had one extra, six fine, three good; Lake, Solano and Los Angeles, each one good; Santa Clara, one extra, one fine; Sonoma, one fine.

Of nine samples of Chauche Gris, Santa Clara had one good; Santa Cruz, one fine, one good.

Napa exhibited two specimens of Palomino, one extra and one good.

Napa, Sacramento and Alameda each had one fine specimen of Verdelho.

Of three specimens of Verdal, Alameda and Merced each had one fine, and Santa Cruz one good.

Alameda had two samples of Folle Blanche, one extra and one good.

Of Sonoma's two samples of Fiher Zagos, one was fine, one good. The same is true of Santa Clara's specimens of White Mission.

Of 10 samples of port, Napa had one fine, one good; Alameda, one good; Los Angeles, one fine; Fresno, one fine; San Joaquin, one extra, two fine.

Of seven samples of sherry, Napa had one fine and one good; Santa Clara and Los Angeles each one good; Alameda, two extra and one fine.

Of five specimens of brandy, Napa had two good; San Joaquin, one extra, two good.

Of the experimental samples your committee reports that the State Viticultural Commission exhibited 36; of these there were four extra, nine fine and nine good types. The University of California furnished 56 samples, but your committee could not make any report upon them, as the wines were not good and were evidently made from unripe grapes, which came from vines too heavily loaded. We also consider that wines made in such small quantities do not show accurately what kind of wine the different varieties are capable of making.

The last paragraph in this report gives occasion for comments by Prof. Hilgard, which are given as University Bulletin No. 57, on page 294 of this issue.

Contra Costa Awake.

The Board of Trade, whose organization, for the purpose of drawing immigrants to Contra Costa county, was noted by our correspondent, "Quien Sabe," three weeks ago, has not been idle. The *Call* states that at a recent meeting of the board a number of the heaviest landowners in the county contributed liberally to the fund which has been established, and also announced that they were prepared to sell portions of their land in small sections in order to attract a population which is sorely needed for the proper development and progress of the county. Contra Costa claims, as an added advantage to its contiguity to S. F., as fine fruit soil as there is in California. Oranges and lemons thrive in Martinez and many other places, and other varieties of semi-tropical fruits abound in the valleys where frost is seldom seen.

The board consists of 200 members, who hope to induce enough small settlers to cast their fortunes there to encourage the building of railroads throughout the county, an enterprise which has been retarded in years past by the ownership of large tracts of land under the Spanish-grant system.

The list of officers is as follows: Pres., E. B. Smith, Martinez; Vice-Pres., Simon Blum, Martinez; Treas., Bank of Martinez; Sec., Will Acton, Martinez. Directors—M. A. Walton, Brentwood; Henry Hook, Pacheco; D. R. Thomas, Martinez; Nathaniel Jones, Walnut Creek; R. C. Terry, Clayton; C. C. Swain, Martinez; C. S. Lohse, Concord; D. Bush, 316 Sutter St., S. F.; F. H. Bee, 917 Clay St., S. F.; L. L. Robinson, 320 Sansome St., S. F.; Geo. Wiley, Danville; B. Fernandez, Pinole.

In a letter to the board, Dr. Strentzel enthusiastically writes: "There are places which, by the concentricity of exceptionally favorable physical and social conditions, are privileged as centers of trade and human development. Such was the region around Damascus along the banks of the rivers Pharpar and Abana, thousands of years ago, and such it remains to this day. It is admitted that Central California, around the Bay of S. F., is the most desirable portion of our State, and the gem of this priceless territory is covered by Contra Costa county."

The Fruit-Growers' Convention.

To the Fruit Growers of California and to all concerned: The State Convention of Fruit-Growers, under the auspices of the State Board of Horticulture, has been called by the State Board to assemble in the city of Riverside April 11, 1887, to continue one week. In connection with the convention a grand exhibit of citrus and other fruits and flowers will be made by the southern counties, especially by San Bernardino county. This exhibit is open to all, and all having inventions of value to horticulturists are requested to exhibit them. Space will be allotted to them if applied for the week before the convention opens. The Inter-Ocean Cold Storage Company will allow their buildings and process to be inspected daily; they will also have on exhibition fruits treated by their process since Feb. 9th. This the deciduous fruit-growers should not fail to see. Decay in fruit is arrested and it reaches its destination without loss to the shipper.

The great flower festival also opens the same week in Los Angeles. This is worth your visit.

The citizens of Riverside will attend to the reception of guests, and every visitor will be provided with proper accommodations. Those desiring accommodations and space in the pavilion will please address L. M. Holt, Riverside. Respectfully,

B. M. Lelong, Member State Board,
and Ch'n Com. of Arrangements.

Los Angeles, March 24, 1887.

It is announced, in this connection, that arrangements are being made to run an excursion from Los Angeles to Riverside over the new road from Pasadena to San Bernardino. This excursion is to be the first through passenger train over that line.

Not Ruled by Whisky.

Editors Press:—It is gratifying to see your columns open to discussion of the temperance question. I wish that the majority of papers were equally so, but they are not, and I have taken some pains to learn why. They are in bondage to the liquor traffic. Many of them get quite a portion of their advertising from saloons, hotels and liquor-selling merchants. Open warfare on the liquor traffic would forfeit this, so they are careful not to offend. I do not give this as mere inference or guesswork. It is what editors have told me in answer to complaints in the matter. Some editors, of course, are in sympathy with the whisky interest but most are opposed to it in principle, and, as far as they dare be, in practice, and it is but justice to them that their readers should know the difficulty they labor under, that it is really the liquor interest and not these editors that is ruling temperance reading out of their papers.

But this is not all. These papers are mostly political-party papers, depending on party patronage and doing their party's work. Their party is dependent on whisky patronage and catering to whisky interest. These papers are expected to follow the party lead and hew to the party chalk-line and no further.

Political partisanism is largely responsible for the scarcity of temperance reading in our county papers. The average county paper does very little temperance work, and seldom reports fully what others are doing. If their readers want information in that matter, they must look elsewhere for it; consequently many who take no other paper are quite poorly informed in regard to the magnitude and force of the great temperance movement in other localities.

Now, the Rural Press is supposed to be independent on the whisky question, and I hope it will remain so and meet the wants of its readers in this matter.

Free Water-Drinker.

[While fully alive to the truth of our correspondent's remarks, we think he overlooks the fact that a great many papers throughout the State are giving large and honorable space in their columns, week by week, to matter furnished and edited by members of the W. C. T. U.—Eds. Press]

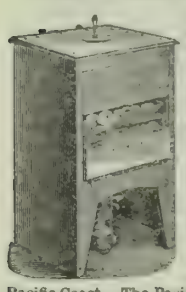
The Irrigator.

The Dissolution of Injunction Law.

An Act relating to the dissolution and modification of injunctions, and amending Sections five hundred and thirty and five hundred and thirty-two of the Code of Civil Procedure. Approved March 24, 1887.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

Sections five hundred and thirty and five hundred and thirty-two of the Act of the Legislature of California, approved March eleventh, eighteen hundred and seventy-two, entitled "An Act to establish a Code of Civil Procedure," is hereby amended to read as follows:



530. If the Court or Judge deem it proper that the defendant, or any of several defendants, should be heard before granting the injunction, an order may be made requiring cause to be shown, at a specified time and place, why the injunction should not be granted; and the defendant may, in the meantime, be restrained. In all actions pending or which may be hereafter brought, when an injunction or restraining order has been or may be granted, or applied for, to prevent the diversion pending the litigation of water used or to be used for irrigation or domestic purposes only, if it be made to appear to the Court that the plaintiff is entitled to the injunction, but that the issuance thereof pending the litigation will entail great damage upon the defendant, and that plaintiff can be fully compensated for such damages as he may suffer, the Court may refuse the injunction, upon the defendant giving a bond, such as is provided for in Section five hundred and thirty-two; and upon the trial the same proceedings shall be had, and with the same effect, as in said Section provided.

532. If an injunction be granted without notice, the defendant, at any time before the trial, may apply, upon reasonable notice, to the Judge who granted the injunction, or to the Court in which the action is brought, to dissolve or modify the same. The application may be made upon the complaint and the affidavit on which the injunction was granted, or upon affidavit on the part of the defendant, with or without the answer. If the application be made upon affidavits on the part of the defendant, but not otherwise, the plaintiff may oppose the same by affidavits or other evidence, in addition to those on which the injunction was granted. In all actions pending, or which may be hereafter brought, when an injunction or restraining order has been or may be granted or applied for, to prevent the diversion, pending the litigation, of water used or to be used for irrigation or domestic purposes only, if it be made to appear to the Court that great damage will be suffered by the defendant in case the injunction is continued, and that the plaintiff can be fully compensated for any damages he may suffer by reason of the continuance of the acts of the defendant during the pendency of the litigation, the Court, in its discretion, may dissolve or modify the injunction, upon the defendant giving a bond, with sureties to be approved by the Judge, and in such amount as may be fixed by the Court or Judge, conditioned that the defendant will pay all damages which the plaintiff may suffer by reason of the continuance during the litigation of the acts complained of. Upon the trial the amount of such damages shall be ascertained, and in case judgment is rendered for the plaintiff, the amount fixed as such damages shall be included in the judgment, together with reasonable attorneys' fees. Upon a suit brought on the bond, the amount of damages, as fixed in said judgment, shall be conclusive upon the sureties.

This Act shall take effect on and after its passage.

INCUBATORS.

THE PACIFIC INCUBATOR!

Awarded the Gold Medal at the State Fair, Sacramento, and at the Mechanics' Institute Fair of 1884 1885 and 1886, over all competitors as the best machine made. It will hatch any kind of Eggs better than a Hen.

DAIRY MACHINERY.

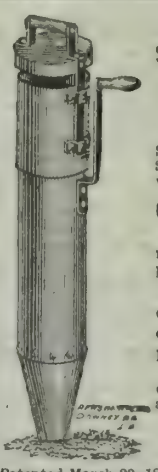
Woolsey's Improved Steam Generator

Has all the requirements of a first-class Efficient and Economical Boiler.

Woolsey's Improved Steam Cheese Vat.

Constructed with a View to Equalizing the Temperature in every part thereof.

Received first premium at the State Fair in 1873, and in 1881. Its chief merit consists in being separate from the heater, thereby avoiding all artificial heat in the cheese-room.



This Generator and the Improved Steam Cheese Vat, which it is designed to operate, has **superseded all others** in the vicinity of Gilroy, and has received the highest praise from cheesemakers wherever it has been tried.

Send for new Illustrated Catalogue. Visitors always welcome! Please examine our herd and prices before purchasing. B. B. LORD & SON, Sinclairville, Chautauqua Co., N. Y.

BEAUFORT.

NEW IMPORTATION
—OF—
NORMAN STALLIONS.

Theodore Skillman has just arrived from France with the choicest importation of Norman Stallions that has ever reached the Pacific Coast. Mr. Skillman has selected these horses from the best in France, with a view to the improvement of draft horses on this Coast. They are young and sure to suit the tastes of intending purchasers as regards color, etc., a number being coal-black. He has also on hand some Imported French Coach Stallions. These horses are now very popular in the East and have long been the favorite carriage horses of France. Their merits speak for themselves. Come and inspect this rare collection of horses and be convinced that they are the best ever seen on this Coast.

☞Catalogue for 1887 sent free on application.

THEODORE SKILLMAN,
Petaluma, Cal.

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, March 30, 1887.

Trading the past week was more active in all lines than at any time this year. This refers particularly to cereals, which, under bad weather reports, have been materially advanced with a strong closing at higher prices. Chicago and New York wheat markets have also been gaining strength. English advices report a better market by private cables, but semi-public cables are as follows:

LONDON, March 30, 1887.—Cargoes off coast quiet, but steady. Cargoes on passage and for shipment, steady. Mark Lane, quiet. California wheat, off coast, 38s to 38s 3d. California wheat, just shipped, 39s 6d. California wheat, nearly due, 38s. French country market, generally dearer. Liverpool wheat, spot, rather easier. Liverpool wheat, California, 7s 6d to 7s 9d.

Foreign Review.

LONDON, March 28.—The *Mark Lane Express* in its review of the week says that the grain trade does not improve. There has been a further decline in the values of the English wheat, although supplies are meager. The sales of English wheat during the week were 42,970 quarters at 33s per quarter, against 76,001 quarters at 40s 9d during the corresponding period of last year. Country flour has maintained its value. Foreign wheat is stagnant; the prospects of ample supplies from America, combined with the opening of the season of imports from Russia, Austria, and India, will cause values to sink much lower than even now. The week's decline in Liverpool amounts to 2s 2d. Flour is irregular and cheaper; some American brands are selling at 1s less. Oats and barley are heavy. Eleven cargoes of wheat arrived and one was sold; 8 were withdrawn and 2 remained. At to-day's market wheat was depressed. There was no buying even at the reduced quotations. Corn was 3d lower. Beans and peas were 9d cheaper. Linseed was 9d lower and at 37s 3d Ex-ship has touched the lowest price on record.

Crops at the East.

CHICAGO, March 27.—The *Farmers' Review* has the following crop report this week: Dry weather continues to prevail in Kansas and in portions of Missouri, which has caused some injury to the winter wheat, though very few serious reports of damage are made, except in the former State. In Sedgwick and some of the other southern counties of Kansas there has been very little rain since last August, while in Neosho, Manhall, and Salina counties the prospects are favorable. The tenor of reports from Missouri is still favorable for the crop. Illinois reports continue to be favorable, and the outlook is still regarded as very good for a full average crop.

Eastern Wool Markets.

BOSTON, March 26.—The aggregate business of the past week in wool, 2,350,700 lbs, shows considerable increase over last week; but the sales are composed largely of Australian wool, considerable of which was sold previous to arrival, but not reported. The market for domestic wool is about as reported for some time, although there has been some inquiry from manufacturers. The tone of the market is, on the whole, strong. Holders find it impossible to move new washed fleeces except at a liberal concession. Medium and coarse lots are held with rather more firmness than other kinds, owing to their comparative scarcity. Considerable uncertainty is found among the trade in regard to interstate commerce matters. The rate of freight will be advanced several cents per pound, from California, reaching up to 5 cents. As a consequence of the uncertainty which prevails, several buyers who usually started for California by this time in former years are now here awaiting whatever turn affairs will take. Territory wool continues quiet, and prices rule in favor of buyers. The sales have been 2,725,000 pounds, including 40,000 pounds medium Montana at 25c; 10,000 pounds fine medium Montana at 25c; 107,500 pounds fine and medium at 17 to 20c; 30,000 pounds fine Montana at 22c; 55,000 pounds fine at 16@20c; and 15,000 pounds fine at 19c. Oregon wools have been quiet, with sales of 50,000 pounds Eastern at 16@22c, and 75,000 pounds Eastern on private terms. California wool is dull. Spring wool might sell at low prices, but there is very little left here. Sales of only 30,000 pounds are reported. Prices are nominally the same. The receipts of the week have been 4921 bales domestic and 5177 bales foreign, against 2939 bales domestic and 2958 bales foreign for the corresponding week last year.

NEW YORK, March 26.—The market has not emerged from the unsettled and tame condition noted of late. There has been a general tendency to report "private terms" on more important transactions and there is really no good guide to a selling basis. The inference, however, is natural that a shading from former valuation has been made, and buyers have had rather an advantage; yet the concessions have not been very material. Sales of the week include 25 bales of scoured California at 52½c; 10,000 Montana at 21c; 100,000 Eastern Oregon, and 1000 fine Territory on private terms.

The Philadelphia market ruled quiet, though it does not appear that lower rates have been accepted than last week. Among sales are 10,000 pounds Territory at 23¼c; 50,000 pounds Oregon at 30¼c; 6000 pounds Montana at 25¼c; 25,000 pounds Territory improved at 21c; 6000 pounds California defective Fall at 16c.

London Wool Market.

LONDON, March 28.—There was a good attendance at the wool sales to-day. The brisk demand of the previous days was continued, and full prices were obtained for all kinds except greasy wools, which were slightly easier; 9493 bales were offered.

Eastern Wheat Markets.

NEW YORK, March 26.—*Bradstreet's* weekly review says: The attention of the wheat trade throughout the United Kingdom and the United States will soon center on the wheat situation in California. What the wheat harvest in California will be in 1887 cannot now be definitely determined. The wheat export movement from California has diminished to small proportions, being for the week ending March 19 only 161,667 bushels, and for the four weeks but 720,000 bushels. There has been an active demand at New York for cash wheat, this week, largely for continental Europe.

New York Hop Market.

NEW YORK, March 26.—The market still drags. Brewers take only a few bales, and show a preference for a decent article that may be secured for the fewest cents per pound. German hops fill the bill as a rule, more common grades at that, though choice Pacifics find buyers at fair prices. The coast crop of 1886, best, 20@22c; same, common to good, 16@18c; 1885, good to prime, 8@10c.

California Oranges in New York.

NEW YORK, March 26.—A cargo of California seedless oranges, from Los Angeles orchards, arrived to-day. There are between 60,000 and 70,000 oranges on board which came through by express in ten days. This is the advance of several cars now on the way, bringing 2,000,000 oranges. These are pronounced by experts the finest fruit in the world, and command nearly double the price of Floridas.

California Fruit in Chicago.

CHICAGO, March 26.—Oranges from all points are coming in more slowly than at the beginning of the week. There is a good supply on hand, including a liberal variety. The market is moderately active and steady, with no material change in prices. Choice oranges have a fair sale, while common are in good demand. Following are the prices quoted by the official circular: California bright Riverside, $3@3.50; do Santa Ana, $2.75@3; do Los Angeles, $2.75@3; do Navel oranges, according to quality, $5@6; do Duarte, $3@3.25; do San Gabriel, $2.75@3; do Blood oranges, fancy, $5@7; Tangerine, $3.25.

California dried fruits are steady, with stocks gradually becoming smaller. Prices range as follows: Prunes, French, ₩ lb, 8@9½c; plums, pitted, 10@11c; peaches, halves, 11@12½c; do, halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London Layers, 20-lb boxes, ₩ box, $1.40@1.50; loose Muscatel, ₩ box, $1.20@1.30; California Layers, ₩ box, $1.25@1.35.

Dried Fruit and Canned Goods East.

NEW YORK, March 26.—Canned goods are attracting little attention, but prices are quoted steady. Standard tomatoes in quantities, $1.05; peas, weak and offered freely; corn, scarce, particularly cheap grades; peaches, dull; California canned peaches, $2.25@2.50; pears, $2.50@2.75; plums, $1.75@2.

Dried Fruits—Raisins are in moderate jobbing demand, but the steadiest feeling prevails as to prices. Two-crown loose Muscatel, $1.20@1.25; do London layers, new, $1.55@1.60. For Turkish prunes there is a jobbing demand at 4⅝@4¾c; Bohemian are offered at 3¾@4c; French are easier at 6¾@7c. Currants are quiet at 4¾c. Citron (Leghorn) held steadily at 17¼@17½c.

California Products at New York.

NEW YORK, March 26.—Seeds—There is a quiet demand, with moderate transactions. California yellow mustard, 3¾@4½c.

Local Markets.

BAGS—The market for standard grain bags is dull and heavy, under free offerings and unfavorable crop advices. Quotations are nominally 5¾ to 6c.

BARLEY—The market, which has been gaining strength throughout the week, was excited and higher to-day, owing to unfavorable crop advices, a large short interest on Call, and a heavy consumptive demand. On Call, sales to-day were as follows:

Morning Session: Buyer season—600 tons, $1.09; 2000, $1.09¼; 300, $1.09⅜; 200, $1.09⅝; 1200, $1.09½; 500, $1.09⅝. Seller 1887—300 tons, $1.00; 100, $1.00½. Seller season—200 tons, $1.07; 100, $1.06¾. Buyer 1887—100 tons, $1.15; 300, $1.14¾; 100, $1.14½. No. 1 Brewing, buyer season—100 tons, $1.20; 100, $1.19¾. Afternoon Session: Buyer season—500 tons, $1.08¾; 400, $1.08⅝; 500, $1.08½; 200, $1.08¾. Seller 1887—100 tons, 99¼; 100, 99⅜; 100, 99½c; 100, 99⅝c; 100, 99⅞c ₩ ctl.

BUTTER—The market closed very weak, but if a scarcity of pasture is confirmed, it is only a question of time when higher prices will rule. Dealers are packing so as to meet distant orders.

CHEESE—The market is easy and weak, with sales as low as 10 cents per pound for choice. The demand is quite free, but the supply is large.

EGGS—The market for strictly choice gains in strength, under lighter receipts and a good demand.

FLOUR—Another and still higher advance is looked for at an early day.

WHEAT—The market ruled strong at steady advances up to to-day, when a decided advance was made, due chiefly to unfavorable crop reports and some shorts filling. The bulk of the short interest have wheat in store to meet their sales. To-day's sales on Call were as follows:

Morning Session: Spot, season's storage paid—500 tons, $1.70⅞. Buyer season—1900 tons, $1.76⅜; 600, $1.76½; 100, $1.76¾; 100, $1.77; 400, $1.77⅜; 1100, $1.77½; 1400, $1.77⅝. July—100 tons, $1.73¾. June—100 tons, $1.75. Buyer 1887—100 tons, $1.88; 100, $1.88⅜; 100, $1.89; 100, $1.89¼; 500, $1.89¾; 600, $1.90; 100, $1.90⅜; 1500, $1.90½. Seller 1887—200 tons, $1.67½; 400, $1.67¾; 100, $1.67⅞; 1300, $1.67; 300, $1.66⅞; 100, $1.66¾; 900, $1.66⅝; 500, $1.66½ ₩ ctl. Afternoon Session: Buyer season—200 tons, $1.77¼; 300, $1.77. Buyer 1887—300 tons, $1.90; 100, $1.89¾; 500, $1.89¼; 200, $1.89⅛. Seller 1887—400 tons, $1.66½; 100, $1.66⅜; 2700, $1.66¼ ₩ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

Wheat has ruled strong at high prices throughout the week. The demand continues to be chiefly from short sellers on Call, as shippers claim they cannot pay present prices. Millers have bought more freely at from $1.63¾@$1.67½. The stock of wheat in the State is less than claimed and well concentrated. The hot north winds of last week did considerable damage to crops in the San Joaquin valley and also in parts of the Sacramento valley. It is claimed by those who ought to know that while many fields have been irreparably damaged for this year, there are many more that will be made to yield good crops, provided seasonable rains fall. There are many dealers who are short on the market that hold to a contrary opinion, but the most reliable advices confirm our reports of severe damage by north winds. On the irrigated and lowlands the crops cannot look better.

The London correspondent of *Bradstreet's* says: "The wheat trade is still dull, and though nearly every one seems to expect an advance in prices, but few are prepared to back the opinion by speculating for a rise. The state of affairs is certainly anomalous. Half the cereal year has elapsed, and our imports of wheat and flour have been only a little over 8,500,000 quarters, while we require about 19,500,000 altogether in addition to our home supply of 7,000,000 quarters to meet the consumptive demand of the cereal year, without reducing stocks below the comparatively low level at which they stood at the beginning of the period. That is to say, we have nearly 11,000,000 quarters to import during the next six months. At this time last year we had imported nearly 8,000,000 quarters, and required only 7,500,000 more for the remaining half year, while the aggregate surplus in exporting countries was much greater than it is to-day. Two years ago our imports for the first half of the cereal year had been about the same as those received during the last six months, and, considering the greater stocks at home, we required at least 2,500,000 quarters less than we need now up to the last of August, while available foreign supplies then, as last year, were much larger than they are at the present time. Another circumstance to be considered is the greater demand on the continent of Europe than during the two previous years."

Barley held to strong prices throughout the week under better concentration and a good consumptive demand. Unfavorable crop weather the past two weeks has done no little in bringing about the improved market. Shipments of the better grades to the East have been on an extended scale, so as to take advantage of the present low rate of freights.

Oats are stronger and a shade higher for the better grades, under firmer holding, light stocks, light supplies to draw from, and a good demand. Several shipments have been made to Oregon ports, where, it is claimed, prices are higher than here.

Rye and buckwheat are unchanged.

Feedstuffs.

Bran and middlings are strong under continued scarcity, but as several mills have been buying wheat more freely, it is quite probable that the supply will increase.

Oilcake meal is steady, with a good demand ruling.

Continued dry weather and free demand cause hay to rule strong. The demand is chiefly consumptive. It is now conceded that the crop this year will be considerably short of last years, while the consumption will be much larger.

Fruits.

Free receipts of oranges obtained throughout the week, but as the weather was warm the demand was heavy, causing the market to clean up well for the better grades. The North draws quite freely. Limes and lemons are in good supply with an improved call reported.

Apples are heavy and moved with difficulty, as the demand is light.

Advices regarding the fruit crop prospects are of the most encouraging character.

Dried fruits continue to rule strong, with another advance reported. The stock here is light, owing to heavy shipments to the East.

Raisins are fairly steady at the low prices current. The stock here is not large for the season. Eastern advices report an improving demand.

Live-Stock.

On Saturday last, quite an advance was made in beef cattle, under a better combination by sellers. The latter claim that there is a scarcity of choice bullocks, owing to the poor pasture. They state that the hot winds of the past week matured the grass on the best grazing lands, consequently there will soon be a shortage of feed. The number of cattle to be drawn from Nevada is placed at not over 6000 head, while there are none, as yet, available from Arizona. Under free offerings of mutton sheep, the market is easy, with some shading in values reported. The free selling is due to owners desiring to market their best condition sheep before driving their flocks to the mountain ranges. Calves continue weak, owing to dairymen still forcing the market. Hogs are easier. Horses are reported unchanged, as are milch cows.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 9½@10c; first grade, grass fed, 9@9½c per lb.; second grade, 8@8½c; third grade, 6½@7½c.

MUTTON—Ewes, 6¾@7c; wethers, 7½@8c.

LAMB—Spring, 12½@15c.

VEAL—Large, 6@8½c; small, 5@8c.

PORK—Live hogs, 4¾@5¼c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5¼c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Under lighter receipts and an improved demand potatoes are strong at a slight advance, with the tendency to a still higher range. New potatoes come in sparingly, causing buyers to pay well up.

Onions are stronger and higher, under light receipts and a good demand for choice.

Asparagus and other seasonable vegetables are coming in quite freely, causing the market to rule easy. Winter vegetables are in light supply, but then the demand does not appear quite so urgent.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	207,997	182,451
In port, disengaged	102,089	58,000
In port, engaged	16,823	26,969
Totals	326,909	257,420

The above gives a carrying capacity as follows: 1887, 523,051 short tons; 1886, 411,872 short tons; increase over last year, 111,179.

Honey holds strong, as does beeswax, with free shipments to the East. Hops are firmer, with an advance asked. About 2000 bales were shipped to the East the past week. New York advices are not favorable regarding the crop prospects.

About all the carryover wool has been shipped, leaving the market bare for the incoming clip which will begin to come forward quite freely in next month. Buyers are offish, owing to the higher freight tariff.

Hams and lard are stiffer.

Poultry is strong at higher quotations, under lighter receipts.

Beans have been shipped to the East in larger quantities, causing a stronger market with us under lighter stocks.

San Francisco, March 30, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

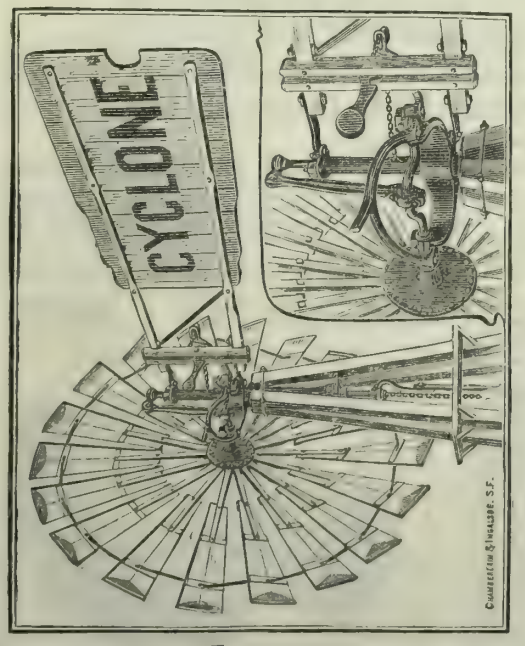
A New Deal.

We buy for cash and sell for cash. The old credit system has been abandoned. We will not be undersold. We guarantee all goods as represented. We will give good value for your money. Our motto is quick sales and small profits and speedy returns.

☞Farmers and consumers will find it to their interest to call and see us and be convinced.



T. A. LAUDER, Manager.

WE DON'T LIKE TO BRAG, BUT WE MUST PUBLISH THIS LETTER:

Tulare, Cal., March 21, 1887.

Pacific Manufacturing Co., San Francisco, Cal.—Some time in November I met your agent, Bartholomew, and he wanted to put me up a windmill. I told him he could put one up on trial if it would run without wind, or if he would furnish the wind to run it; and he said it would come as near running without wind as could be. So he put up a CYCLONE mill on these conditions, and agreed to take it down at his own expense if it did not suit. Well, sir, it has been up about three months, and it has always furnished plenty of water for my stock. It is about two and one-half miles from where I live, and all I have to do is to go once a week and oil it. Now I would not part with it for $500 if I could not get another like it, and in a short time I want another. It is a wonderment to all that see it; it runs with so little wind, and in a gale it stops and does not run at all. They are the "Boss" mill. S. S. INGHAM.

B. V. CUTTINGS.

Bordeaux Varieties.

I OFFER FOR SALE, AT $10 PER M., 200,000 CUTTINGS of the following renowned varieties, tule-packed, F. O. B. at depot: Cabernet Sauvignon, Cabernet-Franc, Merlot, Verdot, Malbec, Tinturier, Portal-Ploussard, Mondense, Petite Sirrah and Grosse Blue. Also from $2.50 to $5.00 per M. all other well-known wine and table grape varieties, too numerous to mention. The above Grape Cuttings are from our vineyard, and we guarantee them true to name, healthy, in good condition, and offered at lowest market price. Ten (10%) per cent invariably in advance on small orders. Information furnished, if desired. Will not guarantee cuttings procured for accommodation from other vineyards, but will always select them from responsible parties and in healthy locations. The Burgundy and Bordeaux varieties are very scarce, and parties desiring to plant this winter would do well to secure their cuttings at once, and save money and disappointment.

ARCTIC OIL WORKS,

Manufacturers of

INSECTICIDE!

FOR ERADICATING AND DESTROYING ALL PESTS THAT INFEST FRUIT TREES AND PLANTS, SUCH AS

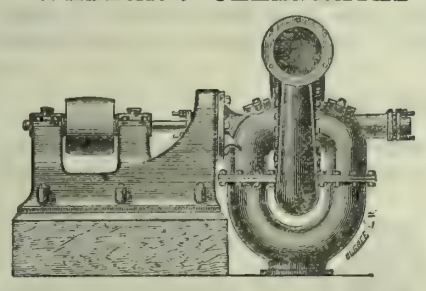
SCALE BUG, HARVEST FLIES, TREE HOPPERS, PLANT LICE, Etc.

It has been fully tested by the Agricultural Department of the State University, and pronounced a success, the endorsement of which we append. It is put up in convenient forms for use both in liquid and paste state.

For Sale in Barrels and 2 and 5-pound Cans in paste form, and in Barrels and 5-gallon Cans in liquid form.

Copy of Letter Received from the University of California, College of Agriculture, Berkeley, dated December 4, 1886.

J. N. KNOWLES, Esq., Manager Arctic Oil Works, San Francisco—Dear Sir: We have lately tested the Insecticide preparation of Whale-Oil Soap sent by you to us, and have found it to be very effectual against the Scale infesting Orange and Bay Trees here; also against the Thrips. From our previous experience with a similar composition, I think it will be found fully effectual against any small Insect Pests not specially protected like some of the armored Scales, and against which any Wash short of strong lye cannot be used. Respectfully,



E. W. HILGARD, Professor of State University.

ENGINES AND BOILERS

A SPECIALTY.

CANTATAS FOR FLOWER TIME!

Teachers of Juvenile Singing Classes do not need to be told of the intense interest and enthusiasm which attends the bringing out of a new CANTATA. The following are new, bright, pretty and easily given. Commence in time to prepare them.

VOICES OF NATURE; operetta; N. B. Sargent.

FOREST JUBILEE BAND; N. B. Sargent.

NEW FLORA'S FESTIVAL; Bradbury. Arranged by J. C. Johnson.

MERRY COMPANY, or Cadets' Picnic; Collin Coe.

Price of each book, 40 cents, or $3.60 per dozen.

The first two books are by a nature and music-lover, who fills them with very sweet songs of birds, flowers, insects, etc. Flora's Festival, doubled in size, and with minute directions, will surely be a success, as will, in another way, the "Merry Company."

Our new edition of **VOICES OF PRAISE** (40 cts., or $4.20 per doz.), by Rev. C. L. Hutching, is cordially commended to all who wish a **Sunday School Song Book** of the highest character.

Schools, Academies and **Seminaries** are always safe in adopting the carefully compiled **School Song Books** of Ditson & Co. We recommend for the higher schools, **SONG GREETING** (60 cents) and **ROYAL SINGER** (60 cents); for grammar schools, **SONG BELLS** (50 cents); and for primary schools, **GEMS FOR LITTLE SINGERS** (30 cents).

☞Any book mailed for retail price.

OLIVER DITSON & CO., Boston.

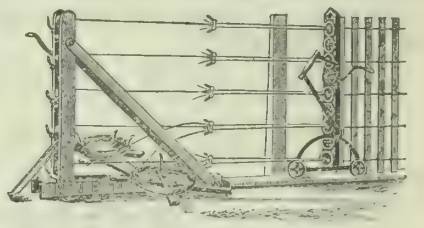
APPLEGATE'S

Cold Water Bleaching Soap

Was Awarded the First Premium at the State Fair at Sacramento, for the year 1886, UPON ACTUAL MERIT.



It can be used in Bath, Toilet or Laundry, and dispenses with Fuel, as no Warm Water or Boiling is Necessary. Beware of Cheap Imitations.

The Genuine is manufactured only by

J. J. APPLEGATE,

No. 12 Bush Street, San Francisco.

NEW Sample Book of beautiful cards, 14 Games, 12 tricks in magic, 436 Album verses. All for 2c. stamp. STAR CARD CO., Station 15, Ohio.

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

THOMAS D. POOLE,
1867 Encinal Ave., Alameda, Cal.

HORTON & KENNEDY'S

FAMOUS

ENTERPRISE

Self-Regulating

WINDMILL

Is recognized as THE BEST.

Always gives satisfaction. SIMPLE, STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbitted boxes.

Positively Self-Regulating.

With no co springs, or springs o any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 6 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

T. S. PAGE, No. 41 West 31st St., New York City.

19 REASONS WHY THE "GLIDDEN" LEADS ALL OTHERS:

BECAUSE being made from new ingot steel wire, it is **20** to **50** per cent stronger than others made from "merchant" or scrap steel wire, and

BECAUSE being composed of one-half to full size larger main wires, its strength is increased **200** to **400** pounds breaking strain.

BECAUSE the Galvanized wire is treated by the English process, which instead of burning the wire, as the acid processes do, ACTUALLY INCREASES ITS STRENGTH. We guarantee it to be **300** to **600** pounds stronger than acid galvanized wire.

BECAUSE the Glidden is **one** to **four** ounces per rod **lighter** than any other barb fencing composed of equal size main wires, for reason of its LIGHTER BARB.

BECAUSE it has the **greatest number of barbs** per rod, hence gives **better protection.** It has in the "Thick Set" style **20** to **40** more barbs than other wires.

BECAUSE though it has **more** barbs, they weigh **less**, requiring as they do 20 to 50 inches less material to make them.

BECAUSE owing to its **lighter weight per rod**, it will cost for 100 rods of fence, **$1.00** to **$3.00** less than other styles at same price per pound.

BECAUSE it has the **shortest, sharpest, lightest, strongest and most effective** BARB.

BECAUSE its barbs cannot be removed or displaced.

BECAUSE it holds its tension better than any other, as barbs do not bind main wires together, thus interfering with contraction and expansion.

Two and Four Point.

BECAUSE it is more **evenly twisted**, thus giving **full strength of both wires.**

BECAUSE it is twisted just enough to give it spring and elasticity, and not enough to overcome those qualities or to make it unnecessarily heavy.

BECAUSE main wires bind the **barb**, instead of **barb binding main wires**, thus giving spring and elasticity the WHOLE LENGTH OF THE LINE, instead of BETWEEN THE BARBS. It is universally admitted that the Glidden REMAINS TAUT through varying temperatures better than any other.

BECAUSE it has most **weight and strength** in main wires where needed, and **least weight** in barbs.

BECAUSE all the barbs are at right angles to the line, and each standing alone makes **every** point effective.

BECAUSE 100 pounds of Glidden makes as many rods of fence as 130 of other styles, where the same size main wire is used.

BECAUSE a guarantee of quality goes with every pound sold, and the manufacturers stand ready to make it good.

BECAUSE it is the most **perfectly made** on most **approved machinery**, and most rigidly inspected.

BECAUSE, in a word, it is universally admitted to be the **BEST.**

More farmers use the Glidden than all others combined. More railroad companies use it than all others combined. It is better known and better liked than any other. It is the STANDARD OF THE WORLD, and where its merits are known, readily commands **$1.00** per 100 pounds more than any other wire in the market. The manufacturers have never yielded, in the sharpest competition, to the temptation of decreasing the size of the wire, nor the quality of the wire itself.

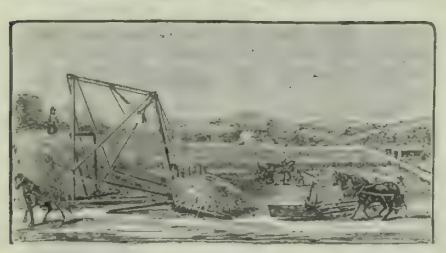
BYRON JACKSON

625 6th St. San Francisco.



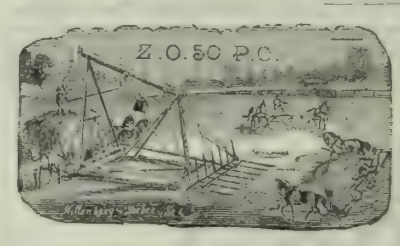
BYRON JACKSON

625 to 631 Sixth Street, San Francisco, Cal.

BYRON JACKSON,
625 Sixth St. San Francisco,
MANUFACTURERS OF
Agricultural Implements.

Jackson's Self Feeders for Threshing Machines, Heave Forks, Derricks, Vineyard Harrows, Steam Derrick Fork Spools, repairs for all kinds of Farm Machinery, Hay, Hide, Hop and Wool Presses, Steam Engines, Threshing Machines, Wind Mills, Dome Bells, Furniture Castings. All orders filled promptly at the lowest market rates.

The "Acme" stacks hay, grain or straw, or loads it on wagons at about one-third usual cost. It takes the hay from the swath (or from the cock or windrow) and puts it on the stack without manual labor. Six men and ten horses put up 100 tons a day. They have been tried in every kind of hay and grain—are a success in reaped grain. They are the best for unloading header wagons with nets, for which purpose a net attachment is used. They lift the net from the header bed, and after dumping, spread it back in wagon. Cheapest machine and cheapest to operate. Improved and adapted to this Coast. Every improvement tested and every machine warranted. The Stacker costs $150, the Rakes cost $50 each. Net attachment to unload header bed, $50. Nets, $6 each.



JACKSON'S IMPROVED RAKE AND BUCK COMBINED.

Used with the "ACME" STACKER, or by parties who do not use the Stacker, in hay, grain and straw. They rake the hay into bunches from the swath, or take it from swath to stack; save all the labor of windrowing and cocking.

Does the work of all other Hay or Horse Rakes, viz.: Wire rakes, sulky rakes, revolving rakes, buck rakes and "go-devils." It rakes from the swath and leaves the hay in large bunches at once, **requiring no hand work.** One man and two horses will keep up with two mowers, following the mower as soon as the hay is wilted enough to be raked clean with any rake. It rakes **cleaner.** The hay will cure **quicker** without bleaching by dew or sun. Very large bunches can be made by pushing from two to six rakesful into one.

If raked and bunched by my Improved "Acme" Rake, the hay is in very much better shape to reload and deliver on the Stacker evenly and level (loading the rakes all they will carry to the stack), and spreads well over the stack, saving labor in stacking, because it has not been tangled, as it is when gathered with the sulky or revolving rake. Bear in mind that wind-rowing hay with any rake is labor thrown away and is detrimental to the neat and most economical working of the "Acme" Hay Harvesting Machinery.

—THE—

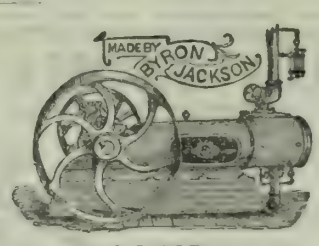
"Z. O. 50 P. C."
"ACME"
HAY STACKER.

PRICE, $100.

Weighs only 1100 pounds, and stacks from 20 to 25 feet high. Over 10,000 have been sold in the Eastern States.

Price $25. ***Weight 170 lbs.***

Has ½-inch Steel Teeth.



Made to rotate either way. Very thorough in its work and don't injure the vines or trees. Used by R.B. Blowers, G.G. Briggs and all leading vineyardists.

THE JACKSON VINEYARD HARROW.

The Best Harrow made for Vineyards and Orchards.

IMPORTANT!

I make a specialty of small engines for farms, fruit and raisin driers, wineries, etc., where stationary power is required. These engines are compact; the working parts are inclosed, working in oil, insuring constant and perfect lubrication. Any farm hand can run them, and there is little liability to get out of repair. Those in need of engines, boilers, etc., are requested to address me for price and particulars.

Southern California Sketches.

Our engravings give little glimpses of some points of interest in Southern California. In a country where there is such a profusion of charming scenes, acceptable either for beauty or historic interest or as exponents of recent progress and development, it is hard to make selection. A choice must be made, however, and the artist has consulted his own inclination. In the upper left-hand corner is one of our grand native oaks, which will convince the stranger that though California has great open plain-like valleys, and is frequently described as a treeless country, we have really great resources in arboreal beauty, in addition to the sequoias which we are generally credited with. Our California oaks are indeed grand trees and they are well scattered over the State. The engraving gives a good idea of the symmetry of the tree, although many specimens would be even more beautiful than the one here sketched, because of greater hight in proportion to the breadth. At the upper right-hand corner is shown a roadway lying through a grove of these oaks—a scene such as can be enjoyed in many parts of the State—the special location in this case being near Pasadena.

In the center the artist gratifies his historic inclinations, and gives us a picture of the famous San Gabriel Mission church, an old structure which is being closely pressed upon by the march of improvements—the locomotive screaming by it on one side, the dusty highway on another—while the orchards and vineyards occupy the old lands of the *padres*.

In the lower picture is a newly established cottage home, with its vineyard on the lower ground, and beyond, over the trees, lies the wide valley encompassed by foothills. This is on one of the mesas, beautiful for outlook and desirable for rich warm soil and genial air—mesas which are now being thickly covered with villas surrounded by orchards and vineyards.

In the brace of little pictures below are given two glimpses of Riverside, whose fame is golden—the place where next week the golden citrus fruits will be displayed in rich profusion, and the wise men of the West will meet to discuss obscure problems in horticulture. One sketch gives a bird's-eye view of Riverside, but shows only a small fraction of the territory which by enterprise, and money, and water, has been transformed in less than a score of years from a hunting-ground for coyotes into a garden spot, whose wealth reaches millions and whose reputation is world-wide. The other sketch shows a section of Magnolia avenue, with its handsome border of trees and palms—a drive which for length and beauty is unparalleled.

SCENES IN LOS ANGELES COUNTY.

A GLIMPSE OF RIVERSIDE AND MAGNOLIA AVENUE.

Orange Shipments.—A perfect stream of oranges poured out of Southern California eastward last week to get away before the incoming of the new Interstate tariff sheet. It is said that seven trains went by the Southern Pacific. On Saturday the California Southern railroad sent out two big special trains of oranges over the Santa Fe route. One was its regular Saturday night special and consisted of 16 cars. The Earl Fruit Company, which recently succeeded to the large fruit business of Edwin T. Earl, shipped an entire train of oranges, consisting of 15 cars, to the East Saturday. The train was expected to make fast time—nearly equal to passenger trains—to the Missouri river. This is claimed to be the first train of fruit ever sent East by one firm from California. The Earl Fruit Company will send East one or two trains each week during the remainder of the orange season.

Modena, the Quaker settlement in Los Angeles county, has had its name changed to Earlham, and obtained a postoffice under the new name.

Santa Barbara's Rose Fair.—The Horticultural Society of Santa Barbara are to give their annual spring display of flowers and citrus fruits in the pavilion on the 12th, 13th and 14th. Their former exhibitions have been famously successful; but they aspire and mean to have the one next week outdo all its predecessors. Roses will, as heretofore, hold the place of honor among the flowers, and growers are requested to affix the name—so far as possible—to each variety. An expert committee will be appointed to correct all misnomers. Ample space will be given to exhibits of citrus and other fruits.

Los Angeles Flower Festival.

The spring flower festival in Los Angeles, of which we gave a notice in our issue of March 12th, is one of the important events of the year, socially and floriculturally, in the southern metropolis. Those who go south next week to the Riverside Convention should visit Los Angeles also, if possible, while the floral fair is in progress. It is expected that the new pavilion will be ready for this year's fair, and work upon it is now being pushed with the utmost speed. It is to be a building of large size, as we infer from a local account which speaks of six arches of 168 feet span, with roof of corrugated iron, etc. The fair is announced to open April 12th, and, as Sunday, April 10th, is Easter, it is planned to make the decorations then gathered serve a second purpose in the pavilion. We notice that adjacent towns are preparing contributions, and the prospect is that an exhibition far in advance even of the wonderful creations of previous years will be secured. The object is to aid local charities, and large sums of money have been secured on former occasions. The ladies in charge are well organized, have made elaborate preparations, and, with the energy they are constantly putting forth in the matter, have good reason to look forward to a glorious success.

Hog Cholera.

Upon another page will be found an interesting article on hog cholera written in a popular style by one of our local veterinarians, Robert J. Dawson, V. S. The alarming reports which are coming in of the prevalence of this dread disease lead us to express the desire to minister to the needs of our readers for information in every way possible. This can be most effectually done if those having the disease among their hogs or in their neighborhoods would write us accounts of its occurrence, its manner, extent and results. By getting possession of such facts our contributors on these subjects can write more directly and usefully to our readers. California has enjoyed hitherto an enviable reputation for healthy hogs and sound pork, and such reputation should be maintained. It may be by prompt action and circumspection on the part of hog-growers. Our climate and our method of growing hogs generally favor the health of the animals, but hygienic rules must be known and observed with hogs as with human kind, even when surrounded by our glorious climate. We think we can aid our readers with suggestions toward that end, and are fully disposed to do so.

Temperance and Hygiene.—There will be general satisfaction over the passage of the amendment to our school law, passed by the recent Legislature. This amendment makes it a part of the public school instruction of every child in the State to be taught the hygienic effects of all narcotic and alcoholic stimulants. The bill passed both houses unanimously, and was signed by the Governor on March 16th.

The rye crop along the Merced river is looking well and there is a large acreage of it.

THE VETERINARIAN.

Hog Cholera.

EDITORS PRESS :—This name for the disease is misleading, because, in the majority of cases, there is constipation of the bowels. Diagnostic symptoms, prior to death, are not well marked. The animals may linger for several days, and in addition to ordinary symptoms of ill-health red and blue patches upon the abdomen may be seen. These are noticed during the latter stages of the disease. On being called to a number of animals dying in a mysterious manner, the veterinarian proceeds to make minute inquiries and post-mortem examinations, and if necessary microscopic investigations.

Post-Mortem Appearances.

Mucous membrane of intestines shows patches of inflammation differing from ordinary inflammation in not being evenly diffused over the surface. Mesenteric glands are altered in character, being inflamed. The lungs are in some cases also affected. In fact, in advanced stages of the disease, where the animals have been allowed to die from its effects, almost all the organs and tissues show signs of the presence of some agent which has produced extensive blood-poisoning. Another post-mortem appearance is tumefaction, or hardening of the small glands of the intestines. Ulcers also are frequently noticed, and these resemble much in appearance those occurring in typhoid fever of man. Inflammation occurs in the lymphatic structure generally, especially the intestines. Sloughing of the dead tissue in the intestine produces ulcers. The changes in the mesenteric glands are secondary to those of the intestines.

Microscopic Matters and Investigations.

In making investigations it is advisable to either kill the diseased animal, or, if allowed to die actually from the effects, to at once make the necessary specimens; as organisms, the result of post-mortem decomposition may develop and thereby hinder the examination. *Bacillus suis* is the term given to the hog-cholera germ, and they may be found in the excrement and in all morbidly affected tissues. After the animal has actually become affected with the disease germ, these germs increase in number and alter in character. This is called the period of incubation. With proper heat and an adequate supply of oxygen, they soon develop and grow lengthwise, by a kind of budding process. They cease to exist when decomposition and putrefaction set in. They will be found in very large numbers in the blood of living diseased pigs. The period of incubation varies from three to seven days after inoculation. It has been proved that virus, after having been exposed to the atmosphere for several days, will yet be capable of producing the disease. This is important, as it is plain that excrement, etc., which is contaminated with the germs, being conveyed in railway trucks, may in this manner take the disease to the most distant States. I think that experiments should have been carried further in testing the question of infection through the air alone. The following experiment, by modification of the virus, through infection, producing the disease in so mild a form as not to kill the animal, yet perhaps sufficient to render the pig non-susceptible to another inoculation, is given: Dr. Law, in 1878, during investigations (Reports of Agricultural Matters) upon hog cholera, placed a healthy pig in a pen between two infected ones, and with the ventilating orifices within a foot of each other. Internal temperature elevated on the ninth, tenth and eleventh days, with lameness in the right shoulder. On the twenty-fourth day the temperature rose two degrees and remained 104° F. and upward for six days, when it slowly declined to the natural standard. Rabbits and mice are very susceptible to the disease, and becoming infected, as they often do, by eating from the same trough as the diseased pigs, they may carry the infection to places at a distance.

General Remarks.

In veterinary practice we have this advantage over practitioners in human medicine—we can stamp out a contagious disease by destroying the affected animals. To destroy and burn the diseased, to thoroughly disinfect the premises and isolate infected places, are the only methods to prevent spread of disease. Stamping out the cattle plague in England, some years back, was successful. When we consider the great number of ailments the pig is subject to—contagious, parasitic, etc.—it seems very strange that it does not occur more forcibly to our minds that much of that disease may be, nay, I will say must be, due to a great extent to the horrible filth which the poor animal eats and in which he sleeps. In the State of California this dirty state of things, or very objectionable manner of manufacturing pork, does not exist to such an extent as it does in other parts of the world. In a State of nature the animal finds a new and clean bed every night, and maintains himself upon healthy food. Many people imagine that anything is good enough for a pig to eat and drink, seeming to forget that the filthy material enters their own stomachs in an altered condition, in the shape of ham or sausages. In Canada I have frequently seen pigs lying for weeks and months in a pen where absolutely no straw has been thrown, and the animals reposing in heaps of dung. In some places I have noticed pigpens in immediate contact with human excrement, coming from a neighboring privy. And although it may, to some extremely sensitive minds, appear too disgusting to mention such a matter, these animals were in the habit of devouring human fœces, and there is no doubt that it is in this way pigs may become infected with the same parasites that occur in man.

I am not wandering from the subject at issue when I state these matters, because I maintain they indirectly bear upon it. We know, beyond a doubt, that pigs and other animals may and do take into their stomachs the eggs of parasites; then why should they not also swallow in the same manner these germs of hog cholera?

Food for swine in England is termed "swill," and this consists of refuse of all kinds—vegetables, etc.—and this food, if it deserves the name, forms a suitable habitat for any disease germs that may be floating in the atmosphere.

Inoculation.

Experiments so far go to prove that inoculation is a success, but I consider that good would result from further research in that particular direction. Probably the virus, after having been passed through the body of some other animal, and thereby modified, as in the case of vaccination, might be as beneficial in the case of hog cholera as in smallpox. A very large number of diseases are now known to be due to germs, and although we do not think to rid the world of all this trouble by the use of some wonderful cure, yet it may be possible to control (and as a matter of fact it is) these outbreaks by adopting proper precautions. The varying length of periods of incubation in different animals depends upon the individual peculiarities or accidents that may affect the development of the bacillus. Again, the varying length of time in which animals die is due to the organs affected; if vital, then death ensues quickly, but in some cases no important organs are much diseased, and then the pig may live several days.

Dr. Detmer, in Agricultural Report, 1878, says: "Dirt and nastiness, consumption of unclean food and of dirty water, facilitate an infection, and warmth and moisture, pregnant with organic substances, are undoubtedly well calculated to preserve the bacillus germs and to develop the bacilli." It has been proved that these germs may be transmitted from pigs to other animals, and although actual proof that man may become infected is wanting, yet circumstances and everything point in that direction. It seems to me that cremation would be a much better method of disposing of the infected carcasses than the ordinary plan of burial. As a matter of fact, I know that at certain farms in England, where anthrax has existed, and the diseased animals have been buried, the disease has remained latent for a certain length of time, sometimes years, and it has then broken out again, and at the same particular spot, or the identical pasture in which the diseased carcasses were previously buried. Now, although scientific men have to be very careful not to accept anything as a fact unless clearly proved, yet such evidence as the above, if further research were made, would, methinks, lead to established facts of much importance. Again we know that under certain conditions these germs will remain in a fruitful state for a great length of time, and that cold, much below freezing point, does not affect them. To repeat, I maintain that cremation of the carcasses would be an effectual method of preventing the spread of the disease germs.

In conclusion, there is no doubt that comparative pathology has been in the past much neglected. Many diseases in man are known to be clearly traceable to the consumption of diseased meat, and a large number still remains to be shown to come from the same source.

ROBERT J. DAWSON, V. S.

225 Geary St., S. F.

THE IRRIGATOR.

Fresno Irrigators Rejoicing.

There was great rejoicing in Fresno county when it became known that the Governor had approved the Act allowing courts to dissolve or modify injunctions in water-suits; and on Saturday evening, March 26th, a mass meeting, under the auspices of the Board of Trade, was held in the Opera-house at Fresno, to give voice to the general satisfaction at what has been achieved in the line of irrigation law-making. Enthusiastic speeches were made by President J. H. Braley, E. J. Griffith, H. S. Dixon, W. W. Phillips, J. F. Wharton, M. J. Church and other representative men. The committee on resolutions, consisting of J. W. Ferguson, C. Chisholm, J. W. Short and G. E. Freeman, presented the following:

The Board of Trade, together with the citizens of Fresno county in mass meeting assembled, do hereby resolve:

First—That we express our heartiest thanks to his Excellency, Governor Bartlett, for signing the Irrigation bills passed at the last session of the Legislature. In this he confirms our confidence in his purpose to faithfully serve the best interests of the entire State, and shows himself in fullest sympathy with that large multitude of his constituents who are struggling to secure their natural rights in the use of the waters of our rivers for purposes of irrigation.

Second—That we tender our thanks to both houses of the Legislature for the passage, by good majorities, of the bills upon irrigation set before them. In this we see the exercise of a broad and liberal statesmanship that argues well for the future of our State. Their action is an important step toward the complete settlement, on a just and equitable basis, of the vexed water question, upon the issue of which such vast results depend.

Third—That we gratefully recognize the able and faithful efforts of our Senator, Hon. G. G. Goucher, and our Assemblyman, Hon. J. P. Vincent, to secure the passage of the several bills upon irrigation. In these and other matters they have well served their constituents, properly requited the confidence reposed in them, and done much toward the settlement of our claim to the waters of the rivers upon a fair and equitable basis.

Fourth—That we view with gratification and great hope the fact that the minds of the people of this State are realizing that the interests of the entire State can be best subserved by the diversion of the waters of our rivers for irrigation, thus bringing into existence thousands of prosperous towns and thrifty communities. In this recent legislation we see the opening of a better policy in the matters of law and justice, a speedy sweeping away of antiquated barriers to progress, and the dawn of an era full of hope and promise in the agricultural prosperity of our people, that will marvelously unfold our resources and prepare the way for the development of industrious home-seekers of the State.

These resolutions being put to vote, they were (so says a local paper) "unanimously carried with great enthusiasm."

A Stanislaus and Merced Enterprise.

The freeholders on the south side of the Tuolumne river have prepared and submitted for publication, in accordance with the law, a petition to which is attached about 80 signatures, asking the Board of Supervisors to call an election for the purpose of voting on the question of organizing an irrigation district under the Wright law. The district that the petitioners propose to form will embrace about 250,000 acres in this county and Merced county, and is described as follows:

Beginning at a point on the left bank of the Tuolumne river where the range line between ranges 12 and 13 east intersects said bank; thence following down said left bank to its intersection with the right bank of the San Joaquin river; thence following up the right bank of said San Joaquin river to the point where said bank intersects the right bank of the Merced river; thence following up the right bank of said Merced river to the point where said bank intersects the right bank of Dry creek; thence up the right bank of said Dry creek to the point where the same is intersected by the range line between said ranges 12 and 13 east; thence along said range line to the point of beginning.

The promptness with which the gentlemen have acted that have had this matter in charge is most commendable and augurs well for the results. If this district is formed, and that is as nearly assured as is possible at this time, we may expect to see water on the plains by this time in 1888. It will be the finest irrigated district in the State in extent and in natural advantages. We predict for it a future that will be simply grand, and a future, too, that is assured as the facilities and natural adaptation to irrigation preclude the possibility of failure in the undertaking. This movement on the part of the landowners on the south of the Tuolumne will soon be followed by a like movement on the part of the land-owners north of that stream. In fact a like petition is now being circulated, but will not be acted upon by the Board of Supervisors at their next session, as the law requires that the petition shall be published for two weeks prior to its presentation to that body. Should this measure carry, great advantages could be gained by beginning the work simultaneously on the proposed canals, as it is confidently believed that one dam on the Tuolumne river will be sufficient for both systems.—*Mod. Herald.*

The Placer County Movement.

AUBURN, April 2.—A second very large meeting of the irrigationists of Placer county was held in the court-house here to-day. The report of the investigating committee of three appointed two weeks ago was presented, and embodied the following points: The North Fork ditch takes water from the American river, opposite Auburn, and can supply the land between Rattlesnake and the county line. The Georgetown ditch has a present capacity of 1000 inches, but to bring it into this county will require a new ditch and pipes 25 miles long. The company proposes to bring from 1 to 3000 inches across in any event. The Giant Gap ditch enterprise will bring water in the future from a point on the American river 55 miles above Auburn. The South Yuba river can supply almost any amount up to August, and was considered the only practicable source for the present year.

It was concluded that the utmost that can be done now is to secure water from that company and make arrangements with them and the Bear River ditch for its distribution through the last-named ditch and its branches. The people, however, are determined to have more water, and if the present companies do not supply it they will do it themselves. It was unanimously voted that the Supervisors should be urged to expend $2500 in advertising the county.

THE STABLE.

His Idea of a Horse.

Lodil Ivery writes to the *Calistogian* as follows:

My horse is not a stately Norman with a pedigree reaching back to a time when Napoleon was unborn. I don't want stateliness and pedigree in either man or horse, but *worth* and *wear*. He is not a Clydesdale from the lowlands of Scotland, though we admire his vast strength; time is too precious for us to wait for the brute. He is not a fleet-footed Arabian courser, "with proudly arched and glossy neck and meek but fiery eye." His shoulders are too pointed for a collar. He is not a trotter with the blue blood of the century running through his veins; a horse cannot plow and harrow and haul and trot a mile under three minutes. Besides, a trotting horse that cannot trot under three minutes will not command a better price than a mongrel that requires 5:40 for a mile.

My horse is a cross between a stout, tough Canadian mare and an English carriage horse—the best horse, for all purposes, that a California farmer can possess. He stands 16 hands high, weighs 1250 pounds, is compact and symmetrical in form, and has splendid action. The Canadian strain in him reduces the amount of daylight below his body, while the English strain gives him a graceful appearance and high action. He can do as much farm work as a horse of any other breed or cross-breed on the face of the globe. Hitched with his mate to a farm wagon heavily loaded, he will travel 20 miles while two large Normans or Clydesdales, similarly loaded, travel 15 miles. With a buggy behind him, he can take an eight-mile-an-hour gait, and maintain that rate of speed for hours. He is good for anything and everything.

He is an animal that requires no extra care, no blankets, boots nor bandages. Give him enough to eat and a good stall, and that is all that is required. He requires no special training, as the race-track and circus are never in view—just hitch him up and make him go. Of all horses he is the one that is raised, broken, and made useful at the minimum cost. Furthermore, he is as good as a bank note. You can always convert him into hard cash. He is always more salable than heavier or lighter horses, as for every man who wants a 1600-pound Norman or Clydesdale, you will find 50 who want a medium-sized horse.

Training Saddle-Horses.

EDITORS PRESS :—Will some one, through the columns of the RURAL PRESS, give instructions for gaiting saddle-horses?

It is a remarkable fact that, while there is a great deal of riding all over this State, a well-gaited saddle-animal is a rarity.

Single-footing is perhaps most prized of any of the gaits for saddle-work. Pacing and loping come next, though a good walker is not to be despised. I am told that in Kentucky raising saddle-animals and gaiting them is a regular business, and that a saddle-horse is not considered worthy the name unless he possesses all the gaits named above. I am sure some instruction from one who understands it would benefit many of your readers.

THE DAIRY.

The Milk Supply of San Francisco.

EDITORS PRESS:—I have your letter of 25th inst., asking for a copy of my late letter to the Board of Health on the city milk question, and which I herewith inclose.

Hon. E. B. Pond, President Board of Health:

DEAR SIR: I desire to say a few words in relation to health matters in this city. I am surprised to notice in the city papers that the Board of Health is so lethargic in relation to the matter of the milk supply of San Francisco.

Being in that business myself, and having become familiar with the business in all its details, I can perhaps see the danger our people are subject to more readily than one not familiar with it, and to me it seems miraculous that our citizens should have escaped so far from epidemics—through the use of contaminated milk—and which might be expected from the use of water in wells sunk in the cowyards.

I know that the parties who employed Judge Swift to gather the information contained in the small pamphlet entitled "The Milk Supply of San Francisco," intended to gather exact and truthful information about the milk supply, and also that they had every confidence in his integrity.

He was exceedingly industrious in gathering his information, as his work will show. He visited every dairy personally from one to several times that he might be sure of his facts, as many dairymen did all they could to prevent his examinations.

It was unfortunate that said pamphlet was distributed before the Board of Health had an opportunity of looking into the matter themselves. That book put the milkmen on their guard, and they had ample time to clean up and send off their sickly cows before the health officers started out.

There has been no disposition on the part of the Board of Health, for several years past, that I have heard of, to investigate the milk supply of this

city. The cause of this unwillingness to act I do not know, and the slight attempt made lately looks as if they did not consider the subject of much importance, or else were not sufficiently acquainted with the ways of the milkmen to secure such evidence as they were in quest of.

Criminal deeds are not openly performed in daylight before witnesses, and it cannot be expected that milkmen generally will have their sickly cows all arranged in a row on view, even for the Board of Health.

Judge Swift usually found them, he says, away from the dairy to which they belonged, and out of sight, perhaps, and the difficulty was not so much in finding sick cows as in finding the real owner.

Supervision of the milk business will be of no avail unless a detective that is honest, industrious, and fearless, is employed; also one who understands the methods employed by milkmen, and one who will know a sick cow when seen.

I desire, for myself, to make pure and wholesome milk, and as rich in nutriment as it can be made, and I should be pleased to have a scientific superr vision of my milk business, in all its details, eithe through the Board of Health or any reputable medical body, and to whose suggestions I would be pleased to conform to the end that the people of this city might have entire confidence in my milk, and I have no doubt that others having country dairies would be pleased to do the same.

Some seem to think that this question of pure milk is raised by rivalry in the business. It has been raised no doubt by those interested in pure milk, but if by rivals, they are in a good cause, and the only persons so far that seem interested in preserving the lives of our children by the use of wholesome food. They are willing to come under a wholesome restraint of the law, and they certainly have the moral right to demand that all producers of milk shall be equally restrained from producing and manufacturing adulterated and poisonous compounds that pass for pure milk.

I hope that you will insist that this matter may be thoroughly investigated and corrected as soon as possible. Yours truly, R. G. SNEATH.

The General Question.

Some of the members of the Board of Health have confined their efforts to an investigation, apparently for the purpose of punishing the parties that have been interested in bringing this terrible iniquity to light, and have declared that no such person's name as E. J. Swift was in the city directory, and consequently the whole report was a fraud.

Since then I have seen Mr. Swift, who is not a citizen of this city. He says that he has been a district judge and has been admitted to practice in the courts of two States and three Territories, and is a professor of mineralogy as well as law, and was brought up on a farm, and has a familiar knowledge of live-stock; and being delayed in this city by some litigation in relation to some mining claims, he accepted the proposition of investigating, personally, the milk supply of this city, and put in from three to four months' time—from daylight till dark—in thoroughly gathering all the facts obtainable.

These facts are, he says, all completely tabulated, and can be used by the Board of Health; and he says, furthermore, that when he saw from the city papers that his facts as well as his existence in the flesh were denied by some of the members of the Board of Health, he came from the country on purpose and communicated with the members of the board, and offered his services, with the assurance that he would show them enough to satisfy them that he was measurably correct in his report.

His report in gross was that the total milk supply of San Francisco was 7338 cans of three gallons each daily, of which only 1300 cans came from the country. That he found in the city limits 149 dairies with 6932 cows, besides numerous very small dairies of which no ac count was taken. He found also that 4529 cows that gave 11,247 gallons of milk were fed on brewers' slops mainly. That 5604 gallons milk were furnished from dairies that used very bad water for their cows to drink and to adulterate their milk with; that 4132 gallons of milk were sold daily from 1585 poor, sickly cows; that 5040 gallons milk came daily from outrageously filthy barns and yards; that 4586 cows were watered from surface wells; that 2667 cows were housed in old, dilapidated barns and sheds where the wind would blow the dust of the filthy yards directly into the milkpails, as the cows were being milked.

These were the principal charges in his indictment against the Board of Health for their non-attention to their very plain duty, and notwithstanding the gravity of the charges, and the willingness of Judge Swift to prove them, the board has, so far as my knowledge extends, refused to go into anything like an honest and careful investigation of the matter, and has declined to allow Judge Swift to substantiate the correctness of his report.

The doubt expressed by the board as to cows ever having consumption, shows conclusively to my mind that they are not informed on that subject as well as the average butcher or milkman, for it is a well-known fact among dealers in cattle all over the world that quite a large percentage of cattle die from consumption, and it is now admitted by many respectable medical authorities that that disease can be transmitted through their meat and milk to the human family, and to other animals by association.

I was pleased to see your article in the RURAL of March 26th on this subject. It is clearly in the interest of citizens to have more pure country milk introduced, and it will be largely in the interest of dairymen in the country to send their grass and grain milk to the city to take the place of the slop milk now sold, rather than make it into butter at the average prices; but the countryman cannot do so at the prices for which slop milk is sold. It is therefore quite legitimate and proper for your valuable paper to assist the farmer in driving out of market the poisonous article sold for milk, and replacing it with a pure, sound article.

It has been announced that a radical change in the membership of the Board of Health would take place soon, and it may be that action has been deferred by them in this matter until the change has been made, in which case it is to be hoped that something may be done by the new board that will effectually drive out all adulterated and poisonous compounds sold as milk in this city. R. G. SNEATH.

Jersey Farm Dairy, San Bruno.

A Report on Butter Adulterations.

WASHINGTON, April 1. — The popular notions with respect to the extent of the practice of butter adulteration before the Oleomargarine law went into effect will not be sustained by the forthcoming report before Professor Wiley, Chemist of the Department of Agriculture, on this subject. Professor Wiley's experiments have been progressing more than a year. The materials for investigation were purchased in open market in all parts of the country. No intimation had been given in any case of the purpose for what the purchase was intended. In not more than one-third of the cases did the purchases prove to be adulterated, except when something else than butter was asked for, and the fraudulent articles were almost uniformly those secured when low-priced materials were called for. In no instance was it found that an article sold in the market was entirely fraudulent. The adulterated articles usually contained between 30 and 40% of pure butter, the remainder most commonly consisting of beef fat, lard and cottonseed oil. Professor Wiley devotes some space to a consideration of the opinion of scientific men with regard to the wholesomeness of oleomargarine and kindred compounds. He finds that 9 out of every 10 of the scientific men who have expressed themselves declare their belief that, properly made, oleomargarine is unobjectionable and wholesome. The larger and more important part of this report is devoted to an analysis of dairy products and their substitutes and the methods of determining adulterations. The chemist's opportunities for investigation were greater than have ever before been afforded, and the result is a treatise which covers every detail of this important subject. The conclusion is reached that the microscope is a much more useful instrument in this direction than European chemists have been willing to admit, and is, in fact, an invaluable adjunct to the chemical laboratory for this particular work. The chemical methods of analysis are, however, no less thoroughly treated, and a few simple means of detection for popular use are pointed out. Artificial coloring substances are discussed, and those which are harmful and those which are harmless are described.

BOGUS BUTTER CONVICTION.—ALBANY (N. Y.), March 31.—The Court of Appeals has affirmed the judgment of the general term convicting Lipman Arensberg of selling oleomargarine in violation of the statute. Judge Rapallo, in delivering the opinion, said the artificial coloring of oleomargarine to make it resemble dairy butter came within the statutory prohibition against imitation.

SWINE YARD.

Berkshires and Durocs.

EDITORS PRESS:—Among the comparatively few persons of this State who take pride in the possession of first-class improved varieties of the hog, we find Mr. T. J. Dale, of the Kaweah River country, 11 miles east of Visalia. He has a pair of thoroughbred short-nosed, dish-faced Berkshires, bred by Wm. Corbett, of San Mateo, in Nov., 1884, of distinct parents that were imported from England and duly registered in both England and America. His young boar Pedro of the same stock, one year old in the coming May, color deep black, was bred by Andrew Smith, of Redwood City, and is also from English parents, registered in both England and America. He comes down from the celebrated "Stumpy" and "Sallie" families of England.

Mr. D. has seven young gilts from the pair above first mentioned—real beauties. We sometimes hear remarks made to the effect that realities never equal pictures. Persons laboring under this impression should see Mr. Dale's thoroughbred Berkshires and be convinced of this fallacy.

Mr. D. has also a very fine lot of thoroughbred Durocs (Jersey Reds), and he is very favorably impressed with the usefulness of this stock. He thinks, looking at the subject from all standpoints, that the Duroc is equal to the best stock in the country. The flesh is very fine-grained and tender, and a very good proportion of lean well distributed throughout, making this variety of hog one of the best for table use, and is by Mr. D. considered at least fully equal to the Berkshire.

The young of the Duroc have grown more rapidly than those of the Berkshire, and from experience Mr. D. finds that rapid growth does not indicate coarse-grained flesh. He feeds his hogs, but for the benefit of many who do not always feed, he would say that the Duroc is the best range hog with which he has had to do. He thinks they support on grass better than do the Berkshires. They rustle around and are a livelier hog. McD.

Tulare Co.

HORTICULTURE.

Nut-Growing in California.

The State Horticultural Society held its last regular meeting Feb. 25th, at Irving Hall parlor, in this city, President Hilgard in the chair. Mr. Gilbert Tompkins was elected a regular member.

Secretary Wickson announced the death of Colonel Webb, who was for many years a member of the society, an earnest worker and secretary of the State Horticultural Board. On motion, a committee consisting of State Inspector Klee and Secretary Wickson was appointed to draft resolutions in respect to his memory.

Walnuts.

At the call of the president, Mr. James Shinn, of Niles, opened the discussion on the subject of nut-growing with a few remarks. He thought that the production of a few kinds of nuts would prove to be a very profitable and important branch of our horticulture. Our product of English walnuts he thought likely to become large. The area would be extended as varieties suited to the different situations become widely known. The so-called Los Angeles variety was well suited to some locations at the south; to other parts of the State it is ill-adapted. The Prœparturiens has shown suitability, but it is only one of several which are worthy of attention. It is a small nut, which is something against it, but it comes in bearing very early, which is a good point. Mr. Shinn showed samples of the Persian walnut which he is propagating. The nuts are fine and large, the tree very prolific; the kernel is white, with very thin skin, and the flesh very sweet.

Mr. Shinn thinks the chestnut will be one of our important crops. The Italian chestnut comes in bearing early, and the Japanese very early. The latter seems to him as good perhaps as the former. Chestnuts make fine avenue trees or border trees around a farm. The Italian makes an especially fine large tree. He had urged the planting of almonds wherever the tree bears well. The trees will grow in many places where they will not bear satisfactorily. It is quite probable that the question of selecting varieties which will prove steady bearers has much to do with the settlement of the almond question, but it is certainly safe to plant them where experience has shown that they bear well. Mr. Shinn said that his experience with the filbert or cob-nut had not been satisfactory. The crop was not as good as the seed from which the trees were grown. Nut-growing in general he thought favorably of, because it helps to diversify our horticulture, and because it gives us an imperishable crop, which can be sold when the market favors and can be gathered in a leisure time.

In answer to questions, Mr. Shinn said that he had not been able to make the "shag-bark" hickory-nut grow. The pecan had grown well and borne some nuts which were, however, without kernels. This he thought would be different when the trees get more age. In Texas, he believed, the trees had to be 30 to 40 feet high to bear good crops.

Professor Hilgard, in answer to a question about peanuts, said it was a mistake to cover the blooms which appear above the ground as is sometimes done. These blooms do not produce the nuts.

Almond-Growing.

Vice president A. T. Hatch, of Solano county, the largest almond-grower in California, was next called upon. He said his first experience was with the Languedoc. He bought 100 trees and they were all Languedocs but one. He found he could not count upon their bearing regularly. He soon noticed, however, that in a circle around that single tree which was of a different variety, the Languedocs bore. There may be many different varieties which will answer to fertilize the Languedoc with. King's soft-shell has this effect, but there is no reason to figure out how to fertilize the Languedoc, for there are many other much superior varieties which do not need such treatment.

In the Suisun valley the Languedoc bears once in awhile, but is not reliable. It blooms freely but has no fruit. It is not the effect of frost, because in the warmest seasons, when there has been no frost while the tree was blooming, the result has been the same. There are other varieties which sell 50 per cent better than the Languedoc, and bear twice as much per tree. One year he shipped seven carloads of almonds to Chicago. His seedlings brought 18 cents per pound; the Languedoc, from 8 to 13½ cents.

Some years ago in this society we discussed the question, What shall we graft our nut trees into? I want those that will bear, and those that will hull without a machine. So I grafted all mine into almonds again. Other fruits pay better now per acre, but in the near future our almonds will yield better returns than any others of them. We have less loss from decay, less pruning to do, and an increasing price. At ten cents a pound I believe them a profitable crop. While other fruits have been growing cheaper every year, almonds are daily higher. I prefer them to all other nuts. In the fourth year I expect a crop which will pay for all the trouble and expense at that time. Even in rainy seasons you can gather, hull and bleach them, and make a good marketable product. An expert in the Eastern markets spoke of our Californian samples as better than any imported nuts that ever reach New York. It used to be claimed that we should get almonds that bloom late so as to avoid the frost, but really the best bearers bloom early. They are the seedlings of a seedling, generated from an old bitter almond. I had grown a lot of seedlings for the purpose of grafting them with the "McCoy," a variety originating in the neighborhood. It was a small almond, hard to shell from the shuck, but a very regular bearer. My buds gave out before the seedlings were all worked over, and I allowed about 300 of them to go into fruit. I found that some of them bore hard and bitter nuts, but some were very fine soft-shell almonds. A number of these I have named and propagated. I have planted them largely myself, and they have been tried in various places where Languedocs have been a failure and with good results. These improved nuts bring better prices, too, because they are better for the buyers. At one trial one pound of imported Tarragona had 6 1-5 ounces of kernels; one pound California Languedoc, 7½ ounces; one pound of Hatch's Nonpareil, 11 ounces; and one pound of Hatch's El Supremo, 13 ounces. Besides this these varieties bore twice as much to the tree as the Languedoc.

Philopœnas not Popular.

Some one asked about nuts bearing double kernels. Mr. Hatch said: "I do not propagate any trees that bear double kernels. I have in shell varieties kinds ranging from the consistency of thin paper up to those so hard as to require the blow of a hammer to crack them. Those almonds which bloom early leaf out very early, and the buds are sheltered soon from the rigors of the weather, and in that respect they are preferable. It has not generally been known how great the duty is on almond nuts. It seems that it is as high as six cents a pound. If that were removed, Californians will be forced to shell their nuts for sale."

In regard to pruning the almond, Mr. Hatch said that when he set out yearling trees he cut them back well, but now he was largely planting dormant buds and June buds, as he has had good results with them. The second year he cut back about half the growth made, and the third year about one-quarter of the growth. After that he only pruned a little, heading back moderately and taking out all crosses of limbs, etc. Thus he gives his almonds considerably less pruning than other fruit trees.

Chestnuts, etc.

W. G. Klee, State Inspector of Fruit Pests, made some interesting remarks on his observations on nut trees. He spoke of fine, large Italian chestnut trees he had seen on the Bidwell farm in Chico, Butte county. These trees have made much greater growth than the Eastern native chestnuts. In the vicinity of Los Gatos, in Santa Clara county, there are a number of young Italian chestnut trees which yield profitable crops. Speaking of the culture of walnuts, he said: "There is no use planting walnut trees in any but the richest and deepest soils. The English walnut requires much finer soil than the native black variety. As the name walnut indicates, from the partial derivation from the German wald, meaning the forest, hence trees bearing forest-nuts, the richest and best drained soil is the habitat of the walnut tree." In response to the grafting or budding of the English walnut on the native species, Mr. Klee said that a number of plain instances of success had been reported.

The Fruit Outlook.

The last few meetings of the society have been very interesting, but the attendance has been rather lighter than usual, owing probably to the subjects not exciting the interest of members. It was therefore decided that at the April meeting (which will be held at Irving Hall parlor, 139 Post street, S. F., April 29th,) the subject for discussion will be, "Is there danger of oversupply of fruit in California?" This is a question of the most vital importance and that all the points possible should be brought forward. President Hilgard appointed Judge Blackwood, of Haywards, to present the affirmative of the question, and A. T. Hatch, of Suisun, to uphold the negative. There will be the fullest opportunity for all to take part in the discussion and to throw any light they can upon the question. The meetings of the State Horticultural Society are held on the afternoon of the last Friday of each month at the place stated above, and all interested in horticulture are invited to attend, whether members or not.

Propagating Trees From Seed.

EDITORS PRESS:—In growing trees or shrubs from the seed, very much depends on planting the seed as soon as it ripens and falls to the ground. This is Nature's process, and Nature makes no mistakes. The vitality of such seeds is very materially injured, and in some instances entirely destroyed, by allowing them to become dry and planting them out of season. Cover all such seeds lightly with leaf mold and they will be sure to germinate and grow finely.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Voting on the Amendments.

Next Tuesday, April 12th, the people of California are to adopt or reject three amendments to the Constitution of the State proposed to them by the Legislature at its last session.

The first to be considered (known for election purposes as "Amendment Number One") relates to the Supreme Court. It is proposed that the Court shall consist of seven justices, chosen by popular vote for a term of 12 years, who shall elect one of their number Chief Justice for a term of two years. The Court may sit in departments or in bank, and shall always be open for the transaction of business. There are to be two departments, to each of which the Chief Justice shall assign three justices, two of whom concurring make an opinion law, unless upon petition it be ordered heard by the Court in Bank. The Supreme Court Commission, created two years since, is to be continued for four years or more, with functions equivalent to those of a department. Provision is made also for the retirement on pension, for the remainder of their term, of justices who may become disqualified mentally or physically while in office.

It is claimed that the adoption of this amendment would enable our court of last resort to clear off in time its arrears of work and keep up with its accumulating business, and that greater dispatch would be insured by allowing the justices elected by the people to decide biennially which of their number is most gifted with the administrative ability required in the presiding officer. We see no reason to oppose this Amendment Number One, and are willing to see it adopted.

"Amendment Number Two" proposes largely to advance the salaries of the Supreme Judges, the members of the Supreme Court Commission and the Superior Judges in certain counties, on the ground that the present stipends are too low to secure the services of the highest legal talent, who "will not seek judicial distinction at the expense of a lucrative private practice."

Judge Blackwood discusses this point so well, in the last issue of the Haywards *Journal*, that we can hardly do better than use some of his very words. "The reason for advancing the salaries is not new—it has been rung on the chimes of every legislative hall in this Union, ever since such halls had a being; yet judicial salaries in all the States have been low, compared with the earnings of some eminent and distinguished lawyer in his private position. Such men are rarely or never called upon to don the judicial ermine. But it does not follow from this that the judiciary of the United States is not filled by eminent and learned jurists—men of honor, men of integrity.

"This whole question was long and earnestly debated in the convention which adopted the present Constitution of California, and the salaries as therein fixed were deemed a just and reasonable remuneration for judicial services. * * * Under the present Constitution our judiciary has been and is filled by men eminent as jurists, and no doubt will continue to be so filled by eminent legal lights, although no increase of salary be voted by the people. The people of the State now suffer from excessive taxation, and when they come to understand the matter they will not vote any increase of taxation when there exists no necessity for the same."

Without having the figures at hand to verify the statement, we believe that in no State of the Union, unless it be New York, are judges paid more generously than here.

It strikes us that legal and judicial services in California are, on the whole, receiving their full measure of compensation. Thousands upon thousands of dollars are expended in appropriations for the benefit of the law-school. The people of the State are paying liberally to educate and train men for lawyers and judges, who thereafter get twice or thrice as much as other men of equal intellect and industry for their time and toil.

It would be interesting, too, in this connection to reckon up the enormous expenses already incurred in merely advertising the coming election, to say nothing of those which are to follow in actually conducting it and ascertaining the result.

Considering the decreased cost of living, since our present Constitution was adopted, it would seem in order to reduce rather than augment the justices' allowance. They will scarcely feel the pinch of poverty or throw up their commissions on an income of $500 a month.

To the adoption of *this* "Amendment Number Two," we are then decidedly opposed. So far from there being any difficulty in obtaining good, competent men to serve at present rates, we have an impression that seats upon the bench are greatly desired and sought by able members of the profession. "It is proper that an adequate compensation be paid by the people for judicial services, as for all other official labor; but when salaries are placed at figures that invite the contention of unscrupulous men for their possession, the honor, dignity and usefulness of the judiciary are necessarily jeopardized."

The farmers, so far as we have been able to learn their views, are a unit against the proposed increase. Business men—from not having had their attention fixed upon it, perhaps—appear rather indifferent about the measure; but had it not been, so to speak, sprung upon the people, had the vote upon it been put off till fall, we conceive that its chances of success would have been slight indeed.

Amendment Number Three relates to the framing of charters for their own government by cities of less than 100,000 and more than 10,000 inhabitants, through a board of 15 freeholders, and as this concerns chiefly Oakland and Los Angeles, we are willing that those most interested in the case shall have the deciding of it.

But however they may vote on the first and third propositions, we urge Patrons and farmers to see that the polls are well manned on election day, and to vote and work earnestly "Against the Amendment Number Two."

A Veteran Patron Coming.

We take the liberty of publishing below a letter from one of the earliest and ablest pioneers in the work of building up our noble Order. Bro. Thompson is also the author of a very valuable and instructive book for Grange officers and deputies, by aid of which the V. W. is being made much more uniform and correct throughout different States and this National jurisdiction. We should certainly consider the accession of such Patrons and families an excellent thing for our State. We are also happy to say that while they may not realize all the good things they may conceive are in store for them in California, we are confident they cannot be otherwise than delighted with our kindly soil, climate, grangers, and people generally.

LAWRENCE, KANSAS, March 28, 1887.

Dear Sir and Brother: Your appreciated favor of 22d ult. I found awaiting me upon my return from a visit to my former home in Minnesota the 5th inst.

My letter to W. M., Johnston, which was unexpectedly published in the *Patron*, has been the means of bringing me much valued correspondence and information about Central California, which I highly appreciate. I heartily thank you for the samples of the RURAL PRESS, so kindly furnished, and for the pamphlet publications. Especially would I return thanks that I may expect the PRESS until July 1st. It will furnish me information that will enable me to pass a more intelligent judgment on many points.

I cannot undertake to reply to each of the letters so cordially written by Patrons advocating the special merits and advantages of their several localities, but shall report to them through the *Patron*. There are about a dozen Patrons whom I shall address personally, among them Bro. E. B. Smith. From the reports furnished by several in regard to their Granges and localities, I shall surely visit them, if I ever go to California, before I decide upon a permanent home.

I was a charter member of one of the first Granges and Master of the first State Grange in the nation, organized the State Granges of Michigan, Ohio, Pennsylvania, New York and Virginia, visited others for instruction, and have lectured in 25 States.

Being now 65 years of age, I desire to select a place that will be satisfactory and pleasant, where I can settle down to quiet life and be at home. Hence I shall desire to visit several Granges I have selected, because acquainted and informed, and decide intelligently. I have property in Minnesota and Dakota which I must sell before I can go to California. I really wish I was ready to go now, or at least this year; but I cannot expect to before 1888, from appearances.

I only want a few acres for a fruit home, well established, and shall desire to keep one horse and a cow and be near a good Grange in an intelligent community and near a pleasant village or city. I have been all my life a practical farmer, raised on a farm in Northern Ohio, and for 30 years have lived in Minnesota and Dakota. Mrs. Thompson's health became such, from severe attacks of neuralgia, that it was best to try a milder climate, and she has been benefited so much by residence here for two years, and we enjoy the fruits of this section so well, that we have fully decided to go to California to remain the balance of our life, as soon as I can sell so as to be able to purchase.

I find that we Eastern people have very indistinct notions of the resources, products and value of cultivated acres in your State. It scares us to hear your prices. We are not accustomed to such values. I must buy in the vicinity of $3000, and will be content with acres sufficient to support self, wife, and daughter 20 years of age. I have two sons, both married, and the younger goes to San Diego about May 1st. I do not expect to engage in grain stock or fruit-raising for profit—only to produce my family supply. Hence a few acres will suffice. I shall visit several counties and Granges in your vicinity, and have no doubt I can find to suit me perfectly. I have been accustomed to the snows, winds and ice of Minnesota, and here it is much milder; but as I read of the temperature, flowers and fruits of California, I strongly desire to go where I can enjoy them the whole year round, and shall, it life is continued.

We have had a few weeks of mild weather, but to-day it has been snowing; the air is raw, damp and chilly, and ground cold and muddy. Excuse me for writing you at such length and using your time. Yours fraternally,

T. A. THOMPSON.

Ceres Grange on Irrigation.

The Modesto *News* informs us that at the last meeting of Ceres Grange the subject of irrigation was pretty thoroughly discussed, and as a result the following recommendation was unanimously made:

"We, the members of Ceres Grange, respectfully recommend that a committee be appointed by those in our county who have in view the establishment of an irrigation district, whose duty, as said committee, shall be to inspect those portions of Fresno county where irrigation is an assured success, for the purpose of finding out, by means of chemical and mechanical analyses of the soil and otherwise, whether our conditions in Stanislaus as regards depth to hard-pan, character of hard-pan and of soil, are similar to those of Fresno."

A committee, consisting of V. E. Bangs, M. M. Williams and P. P. Stiles, was appointed to present it to the public.

The *News* commends the suggestion as a wise one, that should be acted on, and thinks that careful analyses and comparison of soils might set at rest the fears that have been expressed by some that water might have a deleterious effect on lands in Stanislaus.

Grange Picnics.

A combination picnic of Elliott, Washington, and other Granges in that neighborhood is appointed at Clements for Friday, May 6th. The San Joaquin Pomona Grange has it in charge. All the officers of the State Grange have been invited, and most of them have engaged to be on hand. There is to be an open meeting in the evening, and a big turnout of Grangers and sympathizers is desired and hoped for.

Plans and prospects for the Grangers' picnic already announced to take place at Danville, May 7th, are full of pleasing promise. In the fine weather which may then be counted on, the beautiful region under Mt. Diablo will be altogether charming in its early summer robes. We are happy to know that Rev. Dr. Stebbins has definitely accepted the invitation to give an address on the occasion upon agriculture and the farmer's relation to the State. This alone would be a great attraction, but other able speakers will be in attendance. Patrons and farmers, and their friends from far and near, will be welcome, and are most cordially invited to attend without formal or further invitation.

Let Us Do Our Duty.

Granges which hold meetings on Saturday of this week should discuss the Constitutional Amendments to be submitted to the people on Tuesday next. Let us awaken to our full duty, rouse our neighbors to theirs, and work in earnest and efficiently "Against Amendment Number Two."

GONE EAST.—Our genial brother, Daniel Field, of Maine, who has been with us in the Lodge-room so frequently these few months past, has just started on his way home to Maine, where spring business demands his presence. He has greatly enjoyed his visit to California, and we may say that California has greatly enjoyed his visit. He will carry to New England good accounts of what the Grange is doing on the Pacific Slope, and thus help knit more closely the fraternal ties which bind East and West together. Mrs. Field remains with friends awhile longer, till the winter rigors of "Way Down East" are further abated.

BROTHER OVERHISER BUSY.—Brother W. L. Overhiser, W. M. of San Joaquin Co. Pomona Grange, W. O. of the State Grange, and General Deputy, is doing good work to the southward. On the 26th of March he organized Buena Vista Grange, near Delano, Kern county, in a region of great promise; and last week's Visalia papers speak of his holding meetings for the purpose of reviving interest and instituting new Granges at Hanford, Grangeville, and other points in Tulare county.

THE Executive Committee of the State Grange met this week in San Francisco, and we have had the pleasure of greeting Brother Johnston, the Worthy Master, who addressed the people at Franklin last Saturday on the "Constitutional Steal" in the proposed amendments, and will speak at Sacramento to-day, April 9th, upon the same subject.

THE members of the Interstate Commerce Commission have assembled in Washington and begun their sessions. The business piling in upon them is enormous, and their work is in too unformed a state, as yet, to make any definite report of it possible.

THE Grangers' Business Association will hold its annual meeting, to choose directors and transact other business, at 108 Davis St., S. F., on Wednesday, April 13th, at 10 o'clock A. M.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.

In a number of our States the time has nearly or quite come around for the celebration of "Arbor Day"—a day set apart by law and under proclamation of the Governor, devoted to the planting of trees in groves, along highways and around buildings; not only beautifying the home and the neighborhood, but aiding in the restoration of tree-growth, so necessary to maintain a proper climate and the conditions of rainfall and moisture essential to the growth of all our crops. In several States, by direct and united action of the Grange, the proper legislation has been secured for an Arbor Day. In other States Patrons still have this work to do. The day should be observed, and in due form. Organized effort in this, as in other directions, secures better results. Prepare for it; talk it over in meetings. What are the best varieties of trees to plant? When and how shall we plant them? etc. The number of Granges that regularly observe Arbor Day is increasing.

Question for discussion by Granges: *Should forest lands be partially or entirely exempt from taxation?* In view of the fact that forests influence the rainfall, and severe drouths, drying up of springs and streams surely follow their undue destruction, thereby affecting the general welfare of the country, should not those who aid in preserving the amount necessary for the general good have some consideration over those who from their private property receive the full results for their personal use? Farmers frequently cut off their woodlands because they say they are not paying and they cannot afford to pay the taxes on them. In nearly all European countries government assumes control of and protects large areas of forest; schools of forestry are maintained and all for the general good.

The question is sometimes asked, "What is the Grange doing?" To those who will not close their eyes to its work it more and more demonstrates its influence for good, in local, State, and national affairs. Here is an instance of its local work. [Extract from the minutes of Millis Grange, Mass.] "The discussion of the question, How can the Grange increase the property of the town of Millis? brought out the following points: 1. That we do all we can for the Grange. 2. That we set out trees by the roadside. 3. That we help build sidewalks in the middle of the town. 4. That we mow the bushes by the roadside adjoining our farms. 5. That we vote to keep the Danville school running. 6. That we create a public sentiment that the town may vote to grant money to keep the cemetery in repair. 7. That we do all we can to repress the sale of intoxicating liquors. 8. That we attend the church and Sabbath-school. 9. That we support the lectures and moral entertainments."

The evidence appears that we have passed the dull period in Grange history and are notably on the advance with a more determined purpose, with a clearer conception of the means to be employed, and a better knowledge of the results to be gained through co-operation. During the period of seeming inaction and loss in numbers, a time in which our enemies have derided us and sought to depreciate our merits and designs, the principles have been growing upon the affections, and the plans for work in the minds of our people, so that we now feel warranted in saying that our future may safely be relied on as one of steady growth and prominent results. The words of Edward Everett, "We are the architects of our own fortunes," which we were wont to quote to school boys and girls in the past, is being recognized as applicable to the child of larger growth, and its teaching applies to the affairs of life, as an individual or a class.—*N. Zimmerman, Lecturer, Kansas State Grange.*

Capital Grange, located at Lansing, Michigan, had a "Legislative Entertainment and Banquet" a few evenings since, at which were present the officers of the State Grange, members of the Order who are members of the Legislature, and other invited guests, including Brother and Governor C. G. Luce. It was shown that there were more Patrons in the Legislature than ever before; that they were performing their part as legislators in a manner creditable to themselves, and were proving themselves more independent of lawyers than ever before, for which this organization was entitled to the credit.

At this same meeting, Prof. W. J. Beal, of the Michigan Agricultural College, for years an officer and earnest worker in this Capital Grange, now 12 years old, said that they now had 250 members, with prospects for more during the coming year. He also said: "One of the best features of this Grange is the large proportion of young people among its members. I have been a teacher all of my active life, and on you, young ladies and gentlemen, I wish, especially at this time, to impress this idea. Do you aspire to political distinction, to occupy positions of honor and trust? Look at the success of some of those among you to-night, and believe me when I say there is no better place in which to prepare to win success than by first getting a good education, and then doing hard work in a good subordinate Grange. Do you wish to be able to wield a wholesome influence in society in the way of temperance, charity, good morals, good education? This is just the place to prepare for such work."

Two more new Granges have been organized: East Sandwich, Mass.; and Frey's Bush, N. Y.

At last Rhode Island has a Grange, and it is a good one. On Friday, March 18th, S. M., James Draper, of Mass., organized Narragansett Grange No. 1, with 46 charter members. The most substantial farmers of the county and their families are in its ranks. The Lecturer of the National Grange was present, and other work is in progress that will ere long result in several other Granges in the little State.

East Hartford Grange, Conn., has just received 30 new members at one meeting.

Word comes from Georgia that "the revival spirit is *sure*, *heard* and *felt* for many sections. Confidently expect to double our members this year. Since the passage of the Interstate Commerce bill many begin to think we are in earnest, have more power, and are not afraid to use it." So writes S. M., T. H. Kimbrough.

A few more Georgia items tell of sure progress.

Antioch Grange, Harris county, was lately reorganized with 42 members.

S. M., Kimbrough, Ex. Com. Gillis, L., Gunnels, and Forte, of the Ga. S. G. will meet commissioners from N. C. and S. C., Ala., and Tenn. at Spartans-

burg, S. C., April 6th, to inaugurate the "Interstate Grange Encampment" upon a similar plan to that of Williams' Grove, Penn.

"To look forward and not back,
To look up and not down,
To look out and not in,
And to lend a hand."

The Fruit-Growers' Convention.

The Horticultural Convention and Citrus Fair will open in Riverside on Monday, April 11th, and continue during the week. A program has been issued by Commissioner Le Long, of the Los Angeles district, which states that the subjects for discussion will be: First, insect pests and care of vines; second, preparation, marketing and disposing of fruit; third, variety and kinds of fruit trees to encourage; fourth, protection to the fruit industry. On Monday, April 11th, Ellwood Cooper, President of the State Board of Horticulture, will deliver the opening address. An address of welcome will be delivered by H. J. Rudisill, of Riverside; an address on entomology and progress in horticulture by Prof. C. V. Riley, Chief Entomologist of the United States. On the other days Milton Thomas, of Los Angeles, will speak on crystallized fruits; Mrs. H. H. Bergeron, Japanese fruits; G. Tompkins, of Alameda, on fruit packages; A. B. Chapman, of San Gabriel, on the best methods of fertilizing orange orchards; W. W. Klee, of Berkeley, on the codlin moth; M. Cooke, of Sacramento, on summer washes for scale insects; and A. T. Hatch, of Solano, on fruit unions.

To those desiring to attend the Convention, special transportation rates have been granted by the Central & Southern Pacific Railroad Co. to Colton, from all points on their lines. Attendants will need to obtain receipts of local agents for ticket purchased, which receipt, signed by the Secretary of the Board at the Convention, will entitle the holder to a return ticket at one-third the regular rate. The Pacific Coast Steamship Co. will also give reduced price by allowing those who go to the Convention by steamer to *return* at one-half fare.

Los Angeles County Pomological Society.

The Los Angeles County Pomological Society, which was organized April 4, 1885, has been served during the past year by the following officers: President, Hiram Hamilton, Orange; Vice Presidents, J. W. Sallee, Pomona, H. K. Snow, Tustin, Leslie F. Gay, Los Angeles, J. W. Willis, Downey; Treasurer, Milton Thomas, Los Angeles; Secretary, Fred L. Alles, Los Angeles; Executive Committee, W. A. Spaulding, Los Angeles, Byron O. Clark, Pasadena, A. F. Kercheval, Los Angeles; Entomologist, D. W. Coquillette, Anaheim.

The following was the program for the third annual meeting called for the 7th inst., at Monrovia:

10 A. M., morning session.—Music. Welcome, by Gen. W. A. Pile. Response, by President H. Hamilton.

Reading of minutes, etc.—Fred L. Alles.

Music. Essay, Fruit-Drying and Fruit-Dryers, by Rev. J. W. Brier. Discussion of subject in five-minute speeches. Music.

2 P. M., afternoon session.—Music. Essay, Flowers, by W. A. Pile. Discussion of same. Music. Essay, Transportation and Marketing of Table Grapes (Cold Storage), by Chas. F. Perice, of Inter-Ocean Cold Storage Co. Discussion of same. Music. Essay on Apricot and Prune-Raising and Pruning, by J. O. Mathewson. Music.

Evening session.—Music. Essay, Citrus Conditions, etc., M. Baldridge. Discussions of the same. Music.

Report of Committees, Treasurer, etc. Election of officers for the year. Place of next meeting. Adjournment.

This society has done excellent work and we are glad to know of its advancement. In many respects it will serve as a model after which others can well be fashioned.

A Protest Against Caponizing.

In the interests of humanity, a Santa Barbara correspondent, Dagmar Mariager, takes us severely to task for "catering to the barbarities of our unconscionably extravagant time" by publishing an illustrated treatise on caponizing some weeks ago. She says she was surprised and shocked at our giving place to such an article; pleads feelingly for the helpless creatures who are as sensible as we are to bodily pain, yet are daily treated as if devoid of all sensibility; argues that an agricultural paper need not abet and encourage cruelty in order to be able and successful; and, appealing to our human sympathies, urges us on high moral grounds to take a decided stand in the matter, and give our wide-spread influence toward preventing such abuses and promoting more tender treatment of the lower animals.

This is not the first express disapproval of the reprint in question that has reached us, and we doubt not that our correspondent's humane protest will meet with sympathetic response and support from others, who may not be thorough-going vegetarians, yet feel keenly for and practice kindness toward the brute creation.

Business Change.—We are informed that Dr Gustav Eisen, of Fresno, has disposed of his interest in Fancher Creek Nursery.

Agricultural Notes.

CALIFORNIA.

Butte.

Flower Festival at Chico.—*Enterprise:* The ladies of the Presbyterian church have decided to give a flower festival April 21st, 22d and 23d, at Armory Opera-hall. Every one that attended the festival last year will remember what a beautiful sight was presented. But we should be able to profit by experience, and make this flower show even more elaborate and attractive than the last.

Contra Costa.

Grain Movements.—Port Costa, April 5.—Grain is coming in rapidly from the interior, both by water and rail. Some is going aboard vessels for export, but the bulk of it is being warehoused.

Fresno.

Sheep-Shearers Swarming. — Merced *Argus*, April 2: Firebaugh's is all life and activity. Immense numbers of sheep belonging to Miller & Lux are there for the spring shearing. There are 120 shearers employed to do the work, beside 25 or 30 herders, graders and sweepers; and, of course, the usual number of gamblers congregate where money is plenty. The men will have about 140,000 sheep to shear this year for Miller & Lux. The headquarters are at Firebaugh's, and all the sheep belonging to the firm are taken there to be sheared.

Inyo.

Quail Destroying Grain.—*Independent:* Farmers complain bitterly of the damage done to wheat by quail. The flocks are so numerous and the birds so destructive to the young wheat, that it is thought some of the ground will have to be replanted with corn.

Lake.

Successful Well-Boring.—Lakeport, April 4.—Wambold & Beach, who have been boring for artesian water, obtained it on the Carleighe place, in the north end of Lakeport, Saturday, at a depth of 200 feet. They had obtained three good flowing wells in Scott valley; but people here were afraid that Lakeport, being on the other side of a ridge from that valley, was out of the artesian belt.

Deer Browsing Oranges.—Lakeport *Democrat:* Many compliments are bestowed upon T. H. Buckingham on account of his successful experiment in growing oranges in Lake county. We have been told that the greatest pest he has had to contend against in his orange orchard has been the wild deer, as they have killed many trees for him by stripping them of bark and leaves.

Los Angeles.

Hurrying off the Oranges.—Los Angeles *Express*, April 2: The Southern Pacific Company will have seven special orange trains this week—Tuesday, Wednesday, Thursday, and two on Saturday via Ogden, and Monday and Friday via El Paso. This is owing, no doubt, to its being the last week before the Interstate Commerce bill goes into effect, which will advance rates on citrus fruits to St. Louis, St. Paul, Minneapolis and Chicago and common points thereto.

Monterey.

Agricultural Society.—Salinas *Index:* At a meeting of the directors of the Monterey Agricultural Society held recently in this city, the old officers were re-elected, as follows: J. D. Carr, Pres.; J. J. Kelly, Sec.; Wm. Vanderhurst, Treas. W. L. Carpenter, Wm. Vanderhurst and W. J. Hill were appointed a committee to prepare a premium list for the next fair. Paris Kilburn and B. V. Sargent were recommended as directors in place of E. W. Steele, of San Luis Obispo, and O. H. Willoughby, of Santa Cruz county, those counties having each been made into a separate agricultural district, which leaves Monterey and San Benito to constitute District No. 7. The date of the next fair has not yet been set.

Napa.

Home in a Citrus Grove.—St. Helena *Independent:* Visiting Geo. H. Beach's garden yesterday to view the blossoming orange trees, we found that his family are really living in an orange and lemon grove, in the very heart of town. On his residence lot of 88x150 he has 28 orange trees, 4 lemons and a variety of other trees—olive, persimmon, Japanese plum, nutmeg, pear, cherry, peach, plum, apricot, apples and almonds—all loaded with blossoms. Of the 28 orange trees, four have borne fruit the past three and four years, and a half-dozen more are just coming into blossom. The little Oonshiu orange trees, set a month ago, are now making blossoms.

Sacramento.

Rye Pays.—A. A. Krull, of Florin, brought to the *Bee* office April 4th a handsome stool of rye, with well-formed heads. The stalks are nearly six feet tall. He says rye is a profitable crop in his locality. Last year the grain brought a better price per bushel than wheat, and the straw sold for $30 a ton. The straw is used to stuff horse collars. There are 80 acres or more of rye in the vicinity of Florin, and one grower has a contract to supply straw, at $30 a ton, for five years. Mr. Krull says the crop this year may reach 50 bushels to the acre.

San Bernardino.

Oranges Then and Now.—*Press and Hort.:* Ten and 15 years ago oranges in Southern California were sold by the thousand, $20 being the customary price, and lots of people figured how much an acre of bearing trees would produce at that price. As the crop became heavier it was measured by the box and the price was fixed by the box. At the present day the price is fixed by the box, but the crop is measured by the number of carloads. To-day the choice Riverside Navels are selling in Chicago for from $60 to $70 per thousand for large choice fruit, while choice Riverside Seedlings are selling there at from $25 to $30 per thousand. It costs but a trifle more to ship the orange to-day to Chicago than it did ten years ago to San Francisco. Southern California in the good old times did not get so good a price for best oranges as she does to-day; but then her best oranges to-day are better than the best oranges ten years ago. We now have better varieties, and ten years ago, what is now considered our best orange country produced no fruit for market.

San Joaquin.

Ornamental Trees and Shrubs. — The Stockton *Independent* gives the following list of trees, shrubs and bushes set in Fremont square: Three seedling oranges, 4 acacias, 5 Arizona palms, a golden arbor vitæ, 6 roses, 4 yuccas, 1 English holly, 3 myrtles, 6 cedar deodoras, 6 oleanders, 5 euonymus, 3 magnolias, 4 date palms, 18 umbrella trees, 20 American trees, 4 English laurels, 3 loquats, 3 laurestinus, 3 humilis palms, 2 excelsior palms, 2 Portugal laurels, 2 grevilia robusta, 2 century plants, 2 dracænas, 1 hawthorn, 1 variety holly, 2 corypha palms, 3 Christmas berry trees. The trees are all doing finely.

Santa Clara.

Floral Fairs.—San Jose *Herald*, April 4: At a meeting of the Horticultural Hall Association held Saturday, the question of making a display at the Santa Cruz Floral Fair was discussed, and the general expression favored making a small but choice display. A delegation of ladies was appointed to take charge of the Santa Cruz exhibit, consisting of Mrs. E. O. Smith, Mrs. N. A. Saunders and Mrs. S. T. Ingalls. Matters in connection with the Santa Clara Floral Fair, to be opened at Horticultural hall May 1st, were discussed, and a large committee of ladies was appointed to assist in securing flowers and arranging the hall.

Four Lambs at a Birth.—Gilroy, March 31.—On John Fitzgerald's ranch, a few days since, a two-year-old ewe gave birth to a quartet of healthy lambs, something more than usual in stock experience. The same gentleman has a cow which has borne twin calves four years in succession.

Shasta.

Sample County Prices.—Horses are worth from $15 to $175, according to size. Good saddle animals can be purchased for $30, but draft horses for farm work are worth $80 to $150. Stock cattle are worth from $10 to $20 a head, according to age; milch cows, from $30 to $40. Day laborers receive from $1.50 to $2 a day; carpenters and mechanics, from $2.50 to $3 per day. Flour is worth from $2 to $2.50 per hundred; meal, $3; potatoes, 1½ to 2 cents; bacon, 10 to 12½ cents.

Peaches in Dormant Bud.—Mr. Fish, of Stillwater, showed us his peach orchard, set four years ago, part to dormant buds and part to one-year-old trees. Those set with dormant buds looked as if they were two years older than the others. Mr. Fish intends to make a specialty of dormant buds, and advises folks to set out trees on no other plan. Those intending to set out trees, but having no experience in that line in this climate, will be greatly benefited by spending a day with him.

Sonoma.

Fruit and Grape Growers.—Santa Rosa *Republican*, March 31: The Sonoma County Fruit and Grape Growers' Association met Saturday morning, President G. N. Whitaker in the chair. The minutes of the previous meeting were read and approved. W. G. Klee, State Inspector of Fruit Pests, led a discussion on codlin moth, scale, red spider, borer and blight, in which inquiries or remarks were made by Col. M. L. McDonald, Dr. Frazee, Prof. Dwinelle, Hon. John Markley and G. N. Whitaker. An amendment to the Constitution providing for two or more vice-presidents instead of one was passed. Col. M. L. McDonald, N. G. Finley and Dr. C. D. Frazee were chosen to wait upon the Board of Supervisors and request the appointment of a Horticultural Commission.

Stanislaus.

Super-Irrigation.—Modesto *News*, April 1: Last Sunday night at Charles L. Crow's ranch, seven miles from Crow's Landing, they were irrigating from the West Side canal. At a late hour the stream got control of the workmen and flooded the entire ranch, the waters rushing in torrents and rising in some places to a hight of fully one foot. All night long a large force of men worked diligently, and by noon Monday the flood was checked. No material damage was done the land or buildings. A large number of ground squirrels and gophers were drowned out.

Yuba.

Bee versus Chick.—Marysville *Appeal:* A lady relates that a lot of bees came from their hive, which was standing in the chicken-yard, and stung to death about a dozen small chickens. Others were stung but did not die. The quantity of dead bees, in consequence of losing their sting, that fell around the bodies of the dead chickens would have filled a large hat.

Laura.

An Easter Tale.

[Written for the Rural Press by M. B. D.]

'Twas Easter morning, and the grand blue peaks
Gleamed in the sunlight 'gainst the Eastern sky;
A sweet bird chorus rang, the vernal creeks
Went purling onward their clear lullaby,
And mirroring in their limpid depths the grace
Of many a sweet wild rose and pansy face.

And blue-eyed Laura, with her sunny braids,
Sat by the window scanning all this scene;
The Easter bells came echoing through the glades
And o'er the mountain slopes of living green,
Recalling to the spire-crowned house of God
The dwellers of this rock-pierced foothill sod.

Sweet Laura clasped her hands, her gentle heart
Most earnestly sent up a tremulous prayer;
She longed for tenderest love, and like a dart
The breaking of the clear bells on the air
Pierced her fair bosom with a thrilling pain,
"'Tis at the cross thou'lt find this heavenly gain."

Ah! Look into her memory's secret wells,
And find the reason of this ceaseless thirst;
She had the German love of home's dear spells,
And like her old-time ancestors that erst
To love in Fatherland pure Vesta's shrine,
She longed for home and love, and could but pine.

For in a stranger's house she found a place,
They took her from the sea, an orphan child
Tossed from a shipwreck. With the airy grace
Of some half-opened blossom on the wild
Dark billows, with the ocean's restless foam
She had floated to their arms and found a home.

But they had sons and daughters, and their breasts
Could not enfold with them this little waif;
They could not answer to her soul's requests
For that benignant blessing; and though safe
In this kind sheltered nook she did remain,
She ever sighed and longed with hopeless pain.

And oft she felt a cruel, jealous pang,
Because the mother's kiss, the father's word,
Were always for their own though laughter rang.
In childish mirth, her own voice was not heard;
Her little aching heart but longed and grieved,
While all around the tenderest love received.

She donned her pretty garden-hat and flew
To the rich swale that bore a wealth of flowers,
And gathered snowy cress-blooms bright with dew,
And leaped across the creek where grew the bowers
Of manzanita decked with blushing bells,
Of gnarled, yet creamy-tufted chapparals.

Nor did she scorn the azure and the gold
Of blue-bells and wild poppies 'mong the rocks,
But gathered all her rounded arms would hold,
And twined them into wreaths, and starry shocks
Yellow and rich as grain tied by the hand
Of some young peasant girl in Switzerland.

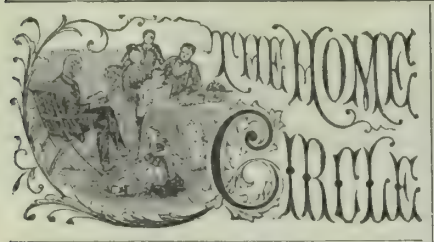
Smothing her braids, and in her best attire,
She walked along the flower-fringed road,
To where the old church reared its lofty spire,
To lay upon the altar her sweet load.
She vaguely wondered as she shyly paused,
Who yonder gray-haired man approaching was.

And then she sighed in sorrow when he drew
Much nearer, and she noted fallen tears
That welled in his sad eyes so dimly blue;
His hair was thin and gray, and with the years
His shoulders stooped, and when he spoke, his words
Trembled like notes struck from deep, time-worn chords.

He was no stranger, she had seen him oft,
The old man living on the mountain-side,
Most humbly in his rustic cot. With soft,
With pitying tones and looks, she now replied
Unto his odd request, "Child, will you hear
The story of an old man's mournful tear?

"I had a precious daughter once, dear child.
Had she but lived she now would be like you,
A blooming girl, I trust as sweet and mild;
But she was lost—" and then he said "adieu,"
For tears again were in his voice, and he
Felt half ashamed that they should fall so free.

"I'm going to your father's house with these,"
He pointed to a basket that was heaped
With eggs as white as mammoth pearls from seas,
Where coral sprays by India's tides are steeped.
"Oh, wait!" the girl exclaimed with kindling eye
And sudden boldness, though she knew not why.



And then she told the story of her life,
And they sat down upon the mossy bank,
Where fell their tears with joy and sorrow rife,
There at their feet the jewel flowers rank
Just framed a mirror with bright living gold,
In which the twain could trace the wondrous mold

Of their two faces, one so young and mild,
And one so time-worn, wrinkled with old age,
And yet they were so like—father and child,
And this was true, so let me close the page.
Her prayer was answered. In the church her voice
Thrilled like the angels' songs when they rejoice.

The two kneeled in thanksgiving 'mong the flowers
That graced the sacred altar, and they passed
The holy portals hand in hand; the hours
Had wafted them a new life, so at last
She finds a true home in the sheltering cot,
And makes most glad her aged father's lot.

Great Land Sale.

The reader of this issue of the Rural cannot well overlook the attractive advertisement of land sale at Templeton, San Luis Obispo county, and the reading matter relating thereto which appears in another column. Certainly there could hardly be a better chance to see this country, which is now so popular and advancing so rapidly, than at the rates offered by excursion trains which will leave San Francisco at 8:30 on April 13th.

Garnered Truths.

[Written for the RURAL PRESS by MALLIE STAFFORD.]

'Tis not mere toil that makes us weary,
That burdens life;
But discord, and long years of dreary
And bitter strife,
When peace has fled,
And in its stead
Despair and sadness mock our years
With blinding tears.

'Tis not mere poverty that smothers
Each impulse high.
The bosom that can ache for others,
And heed their cry,
Sad hearts may soothe,
By words of love,
Tho' no broad lands, nor silken vest,
Their wealth attest

'Tis not mere fortune's frowns that sever
Life's sweetest links,
But wrong and censure, ending never,
The spirit sinks.
Well may we brave
Fate's stormiest wave,
If love and tenderness doth bless
Our keen distress.

Life may be made well worth the living,
If Love but rule.
There's not so much in gain as giving
The measure full.
Through good and ill,
'Twere better still
To give, and freely give, than take
For love's sweet sake.

Life's noblest truths are slowly learned,
But this we feel:
Our happiest work is what we've done
For others' weal,
Forgetting self,
And worldly pelf,
To toil for human hearts that bleed;
For those who need
The loving word and kindly deed.

This is not all, this restless yearning
For what life brings!
Our hungry spirits ever turning
To earthly things.
Eternal life, and peace, and rest,
Are for the blest,
For those who live, and those who heed
Christ's loving creed.

Minerva Rhine's Brief Reign.

[Written for the RURAL PRESS by EMELIE TRACY J. SWETT.]

Minerva Rhine was one of the vast army of the disappointed, who, having seen one ambition after another shattered to atoms, sink into a listless apathy, performing each day's duties with dogged faithfulness, and hope for a wider scope of action at some time, either in this world or the next. Minerva's husband sometimes said to himself, as he furtively watched her, "I do wish thet Minervy was a leetle more spry. Ef I knew how to make her sperrits raise, I'd do it; but there! a man like me, 'thout no knowin' ez to wimmen's ways, can't do nothin' but look on an' wait. All is, I'd like to see Minervy more happy-like."

One morning Mrs. Rhine astonished her husband by remarking, almost forcibly:

"Lawsy! if I couldn't write better an' more Christian pieces than Mis' Parsons, I'd keep out of the papers. She's jest too narrer-minded to write. I don't b'lieve she's bin out o' Dead Gulch sence it was settled, an' I've lived here an' observed for 30 year come May."

"You don't think of takin' to the perfession yourself, Minervy, do you, now?" said Jacob Rhine, quizzically eyeing his wife.

"You kin jest mind your own affairs, Jacob Rhine," hotly retorted Minerva, commencing to clear away the dishes.

Still puzzling over the sudden turn of things, Rhine went out about his chores, muttering: "Wimmen is cur'us; though, come to think on't, there is some ez hez thought o' that before me."

After that, Minerva contracted a most singular habit of secluding herself in her room for a stated portion of each day. Some of the family, in speculating upon it, said that Minerva must have experienced religion and sought retirement for purposes of meditation.

To tell the truth, the great literary tidal wave rolling over modern civilization, sweeping the broom and needle out of many a good woman's hands and replacing them with ponderous notebooks and rough manuscript paper, spent itself in this far Western settlement of Dead Gulch, firing Minerva Rhine with all the ambitious zeal which had lain dormant within her for years. Minerva was illiterate, but in the unconscious bliss of ignorance, the fact was no obstacle. Running her scrawny hands, which had done frontier work for 30 years, through her thin locks, which were silvering at the temples, and adjusting her spectacles, she sat down at her marble-topped table, furnished with its cheap ink-bottle and some blank paper, and remarked with decision:

"I hev plenty to say, which is more'n most on 'em hev. I was readin', only this mornin', thet people wanted sunshiny pieces; but lawsy! them ain't the things thet set men's hearts a-palpitatin' an' fetch tears to wimmen's eyes. I've lived an' observed a long time, 'an' the thing thet moves the heart is sorrer—an' the more sorrerful the sorrer is, the better people like it. Mis' Parsons has written for the Dead Gulch *Banner*, an' if I couldn't do better'n her I'd keep my mouth shet. But lor! makin' reflections ain't writin'; an' besides, I don't know ez reflections on your neighbor is quite Christian."

After each day's seclusion in the mysterious chamber, Minerva emerged with flushed face and ink-stained fingers, that raised a great many doubts in the bewildered Jacob's mind. He was far too wise to press his investigations, for once when he had made bold to question his wife, she had eyed him menacingly, and said in a way that checked further progress:

"Jacob Rhine, you jest wait, will you?"

One morning, as she sat in her room, elaborating a romance that had recently come under her notice, she heard her husband come in from the barn and call out in great excitement:

"Minervy! Minervy Rhine! Where in the name of blazes be you?"

Although annoyed at having her train of thought rudely broken, a mingled feeling of curiosity and apprehension caused her to rise hastily and open the door.

"Well, Jacob," she called, "here I be."

"Minervy Rhine, ef you ain't bin an' done it."

"Done what? What air you drivin' at?" asked Mrs. Rhine, adjusting her spectacles again and placing her arms akimbo.

"Look at that, now!" ejaculated her husband, flourishing the Dead Gulch *Banner* in his left hand. "Minervy, what ever put you up to write for the *Banner*, an' you with no more edoocation than you've got?"

Mrs. Rhine shrank back apprehensively. She began to realize her temerity in laying herself open to the ridicule of a widely circulated periodical. When she could master her feelings, she looked her husband squarely in the face and said:

"See here, Jacob Rhine, you an' me ain't never hed no words yet. I may not hev hed a first-class edoocation, but I hev hed idees, an' idees count for more'n learnin' nowadays."

Lowering her voice to a nervous whisper, she leaned doubtfully toward her husband, and while trying to catch a glimpse of the article, she said:

"They ain't made fun o' me, Jacob, hev they?"

"Fun? Oh, no, leastways so far ez I kin see."

As she took the paper, her hand trembled, and when she actually saw the labor of weeks before her eyes, printed so clearly, and her name signed at the end, her excitement culminated in a flood of tears. Presently Jacob looked toward her and said ruefully:

"Minervy, there's more to come."

"How?"

"Wa'al, the first I knew was this morning, Jim Hawley stopped an' leaned over the fence. He asked what hed struck you so sorter sudden like. 'Twan't religion, I know, for thet works in another way. What was it, Minervy?"

"Well," explained Mrs. Rhine, "I read some o' them pieces thet Mis' Parsons wrote, an' I thought thet if I couldn't do better'n her, the more's the pity."

"The Bible says, 'forgive your enemies,' Minervy; is thet what you did? Jim Hawley says I'll hev to pony up harndsome. Mis' Parsons is riled; Jake Cumins is riled; Sary Skiggles is riled—in fact, Minervy, the town is buzzin', an' I'll hev to square it with them ez is mad. Ef you hed only said nice things about 'em!"

"I didn't use no real names, Jacob; an' all I told was gospel truth."

"I hevn't read it all yet, Minervy, but Jim Hawley sez there is them in the county ez will make it too hot for us to stay. Ef you'd only asked me, Minervy, I could hev saved you this."

"I only paid back them ez I owed slaps to," defiantly protested the mortified Minerva.

"Thet ain't the way to get even with enemies, Minervy—let 'em alone is the sure way."

"I can't help it, Jacob, if they see themselves. If the cap fits let 'em wear it; thet's all I can say," retorted Minerva, defiantly, tossing her head and going back to her room. She was deeply mortified, but she was determined not to show it.

As to the editor of the *Banner*, Moses E lenwort, he had laughed heartily upon receiving the quaint, misspelled manuscript with its cramped, painful chirography. With the remark, "Another crank that had better be at the washtub," he wearily brushed through the opening pages of the article. Dull curiosity gave way to lively interest. The writer had ideas. Perhaps she chose the dialect form as a sort of Artemus Wardism. A touch of pathos here; a bit of quaint humor there; a dab of malice; a dry reflection; eccentric philosophy—indicated talent and experience. The writer's ability was undoubted, according to Moses Ellenwort's mind. He set the article up, and then wrote to Mrs. Rhine:

Dear Madam: We shall be glad to hear from you often. Yours sincerely, THE EDITOR.

Although Ellenwort was an easy-going country editor, he sometimes stumbled upon the truth in his criticisms. In regard to Minerva Rhine, he was right. Her style was provincial, but then the greatest writers have done their best work in localizing their genius. One thing only hindered Minerva from continuing her literary career indefinitely—localization has a limit.

There came a time when, aside from the fact that half the county were her sworn enemies, she had no more village dramas to elaborate. The vital interest that she had felt at first, waned—adverse comment killed it. Her brief reign had given her the social leverage that any intellectual superiority gives one in a small settlement; it had made her feel that life still held hopes of something better than continued disappointments; it had proved her ability to succeed in some line in life, which is a great point for a woman to make; and it had relieved her of the weight of facts that had accumulated in her mind and burdened it for years. Now, like a sensible woman, she saw that her part was played, and it would be wise to stop. Mrs. Parsons somewhat hastened matters by making the remark, which the village tattle brought at once to Minerva, that "Minerva Rhine orter take a back seat, an' let them ez was more youthful hev a chance. But lawsy! the Bible never sez a truer word than 'them ez hez, gits.' Now she's got the whole county down on her, an' she thinks she ken run Mose Ellenwort an' his paper. It would be jest like her to keep on grabbin' for the best till the day o' judgment."

But Jack Hawley told Jacob Rhine, in confidence, that "Mis' Parsons would give every dollar in the world to write like Minervy. An' Jacob, never mind if she does talk about prosecuting you an' Minervy; she dasent do it, for she is ez 'fraid ez anything of Minervy's pen."

FUN IN SCHOOL EXERCISES.—Mark Twain has written a little book soon to be published by Cassell & Co., entitled "English as She is Taught." It is made up from a note-book of a public school teacher not many miles from New York, who has preserved all the amusing errors her pupils have made during the past few years. The compilation is one that nobody with a well-regulated sense of humor can read without shouts of laughter. In the perfect seriousness of the blunders lies their absurdity. Here are some of their answers to words they were asked to define: "Auriferous, pertaining to an orifice;" "ammonia, the food of the gods;" "Equestrian, one who asks questions;" "parasite, a kind of umbrella;" "ipecac, a man who likes a good dinner." And here is this definition of an ancient word honored by a great party: "Republican, a sinner mentioned in the Bible." And here is an innocent deliverance of a zoological kind: "There are a great many donkeys in the theological gardens." Here also is a definition which really isn't very bad in its way: "Demagogue, a vessel containing beer and other liquids." Here, too, is a sample of a boy's composition on girls, which, I must say, I rather like: "Girls are very stuckup and dignified in their manner and behaveyour. They think more of dress than anything, and like to play with dowls and rags. They cry if they see a cow in a far distance, and are afraid of guns. They stay at home all the time and go to church every Sunday. They are al-ways sick. They are al-ways funny and making fun of boys' hands, and say how dirty. They can't play marbles. I pity them, poor things. They make fun of boys and then turn round and love them. I don't believe they ever killed a cat or anything. They look out every nite and say, 'Oh, ain't the moon lovely!' Thir is one thing I have not told, and that is they always now their lessons bettern boys."—*Ex.*

BEING OUT NIGHTS.—These words of Beecher, as to the training of children, have an application in places smaller than San Francisco or Los Angeles: I do not like to sow the seeds of suspicion in the minds of parents about their children, but there are thousands and thousands of parents in our great cities who think, who *know*, that *their* children "never lie," and yet their tongue is like a bended bow. They think their children never drink; but there is not a fashionable saloon within a mile of their homes that the boys are not familiar with. They think their children never do unvirtuous things; and yet they reek with unvirtue. There are many young men who, when they return to their father's house, are supposed to have been making visits to this or that person. It is a mere guise. The practice of allowing children to go out at night to find their own companions and their own places of amusement, may leave one in 20 unscathed and without danger, but I think that 19 out of 20 fall wounded or destroyed. And if there is one thing that is more imperative than another it is that your children should be at home at night; or that, if they are abroad, you shall be abroad with them. There may be things that it is best you should do for your children, though you would not do them for yourselves; but they ought not to go anywhere at night, to see sights or take pleasure, unless you can go with them, until they are grown to man's estate, and their habits are formed. And nothing is more certain than that to grant the child liberty to go outside of the parental roof and its restraints, in the darkness of night, is bad, and only bad, and that continually.

COMPROMISING.—"No, Bobby," said his mother, "you cannot go skating to-day. It's Sunday, you know."

"Well, ma," persisted Bobby, "can't I go if I'll just skate straight ahead and not try to do any fancy work?"—*Puck.*

C. L. S. C.

[Written by FANNIE H AVERY, and read at the Chautauqua Reunion held in S. F. March 29, 1887.]

Chautauqua! it would seem as if with thee,
The hope of poets and each generous soul
Might be fulfilled, and culture scattered free
Throughout the land. For 'tis thy noble goal
That all attain to intellectual life:
That all should know what can be known by them
Of the vast Universe which is so rife
With harmony and beauty past compare,
That all should have exalted aims, and care
For truth and goodness more than diadem,
Or ease, or fame. Oh, may the greatest of success attend
Thy work, Chautauqua! 'Tis inspired by God.
May thy glad tidings spread both far and broad,
And thy large circle more and more extend.

Winter in the Heart of the Rockies.

[Written for the RURAL PRESS by FANNIE ISABELLE SHERRICK.]

To those who have basked in the perpetual sunshine of California, the realization of a Colorado winter will be almost impossible. In this little town, shut in from the rest of the world by high mountains, the winter has indeed been a long one. At an altitude of nearly 8000 feet the snow comes early and stays late, and ever since last October the ground has been completely hid.

Just now, under the genial influences o March sun the white mantle is rapidly disappearing from the mountains with a southern slope, but those facing the north still wear their kingly garment of ermine.

I think nothing could be more sublimely beautiful than these pure white mysteries reaching to the sapphire sphere above, with the background of the ranges higher, whiter, more sublime if possible.

Often I have stood beside the Pacific, awe-struck, wondering at the god-like majesty of that waste of waters; so here I have looked upon this tideless sea of snow, filled and thrilled with the vast wonder of it.

I think one must spend a winter among the mountains to understand the supreme grandeur of nature. In summer her beauty is so softened by all that is delicate and tender; in winter she is stern, inaccessible, awful. Yet even then her awfulness is clothed in a beauty which is transcendent; the glittering icicles, the tall, dark pines clad in their white plumes, the dusky peaks creeping out here and there amid the snow, the soft shadows falling on the icy slopes—all these temper the austerity of her wide, white desolation.

Life in this new mining camp is dull during the winter, but it is not without its attractions, both socially and otherwise. The place is cosmopolitan, but the rougher element does not prevail. One meets with refined people everywhere, and the circle of society is presided over by cultured ladies who would be queens anywhere.

Until within the past year there were few houses in Aspen worthy of the name, but in this year many elegant homes have been built, and every week adds to the list of lovely little cottages which are taking the place of the old log cabins. New business blocks are being built, and by the time the railroads are completed the town will present an attractive and imposing appearance.

And one must not judge the interior of any home here by its exterior. Often the roughest-looking log house will have an interior which is a revelation, so beautifully will it be furnished and so skillfully arranged, with a taste which one may well call art. Women here make the best of their opportunities and their resources, and nowhere is the grace and ingenuity of woman's mind more apparent.

To one who has never passed a winter in a mountain town it would require a lively imagination to picture either its appearance or its life. From October until March the streets were knee-deep with snow and every vehicle was on runners, even the baby perambulator. Ladies waded around either in arctics or rubber boots. Yet in spite of these drawbacks, every one seemed to enjoy life. Sleigh-riding and coasting were the principal amusements—the latter being especially fine down the long, gradually sloping hills.

Nothing could be more perfect than the moonlight nights here in winter, the silver light radiating from every white peak and mountain-side, and falling in a flood of glory on the quiet valley. No wonder that coasting was enjoyed, and that young hearts beat faster as the sleds almost leaped down the icy slopes. The new fashion of tobogganning has not yet reached here, and surely this exhilarating old-fashioned amusement of coasting is a pure enough pleasure for all.

Besides these amusements there were other social enjoyments of a different nature, but equally attractive. Public entertainments were quite frequent, and in private circles there were many gatherings most pleasant in character.

The great Chautauqua movement is felt even here, and many of the most refined and cultured ladies of the town formed themselves into a circle for the improvement of their intellectual powers. Their studies have been productive of much pleasure as well as good, and, notwithstanding the dearth of extensive libraries and the access to needed books, their work has not

fallen far short of the highest mark. Some of the loveliest ladies I have ever met belong to this circle, and they are as loyal wives and mothers as they are conscientious students.

This latter clause is saying much, for, in this isolated mining town, "help," that much-discussed and often overrated essential of the American household, is almost impossible to obtain, and the majority of the ladies do all their own housework, occasionally, by begging or entreaties, securing the services of a laundress or a charwoman.

Girls are scarce and will not work for less than $30 a month. Even at this price they consider that they are conferring a great favor, and some of them even demand and receive $40 a month.

The impertinence and exorbitance of the washerwoman in this place is proverbial. If it were not so annoying I might almost say ludicrous. She demands $2 a day, and three of the best meals one can get for her, disdaining to eat in her employers' house the common fare that she probably digests at home. She comes late and goes early, and requires almost as much waiting on as the Queen of England. When she irons, the lady of the house, if she desires peace, will bring in the wood and keep the fire going. All that this invader of your household does is seemingly done under protest, and usually her day's work leaves you about as tired and certainly more dissatisfied than if the wash had been done by your own hands.

I cannot understand why women who are compelled by stern necessity to labor should be so blind to their own interests. But of course at present they have the upper hand, and so long as they do, will assuredly make the best of the situation.

Most of the ladies, therefore, do their own work, but they do it in such a noble way that it seems but an added grace to their accomplishments. And so I think they deserve the highest praise for studies and employments tending to mental culture under such manifold disadvantages, and I do not think there is any neglect of duty toward either home, husband or children. This indeed proves what women can do, and delicate, high-bred women, too, who have been reared in homes of luxury and accustomed to all the refinements and advantages of life in affluent Eastern homes. It is a new era for women and shows the independent aspiring and noble reaches of womanhood, and I feel sure that there are hights and depths in the nature of the true woman yet to be sounded, qualities which will come more and more to the front as she realizes her unbounded freedom.

When the woman of society, mentally and physically endowed with all the graces of the ideal lady, can quietly put her white hands nto the dish-water not feeling degraded as she has hitherto by the menial labor, but rather feeling elevated by the performance of duty, then indeed has she reached her ideal womanhood. Not that I am an advocate in the least of a woman's spending any time in mere drudgery when it is not needed, for there are so many other ways in which her hands and heart may be employed; but I do say that the acceptance of the situation proves the true woman.

I do not know where in all my travels I have ever met nobler, more perfect and unselfish women than in this mining camp, in the very heart of the Rockies. And I think if any woman deserves to be a bonanza queen, it is she who follows her husband unflinchingly, away from all that she holds dear, from all the comforts and advantages of her Eastern life into these mountain wilds, ready to endure all the trials and privations that may come to her.

But these pioneer women are reaping their reward, not only in their beautiful homes, but in all the comforts and advantages which increased wealth must bring.

I wish I might show you the charming little lake here and the many lovely residences springing up around it. Two of them might almost indeed be called palaces fit to crown Nob hill. These belong to two of the bonanza kings, those who have made their money from the vast treasure vault of Aspen mountain. There is no article of luxury or art wanting in these truly magnificent homes, and they would be an ornament to any city.

Most of the mines are located on Aspen mountain, rising like a solid white wall in winter, south of the town. It is not alone interesting to the prospector or mine-owner. To the poet it is a grand mountain, fraught with the deepest meaning. There, in those mines, are centered the hopes of so many—some fated to reach the highest realization, others doomed to bitter disappointment. A struggling humanity sees in that white mountain the star of fortune. There lie millions for the favored, and a despairing emptiness for the unfortunate. In its dark heart men are toiling daily, hour after hour, for the hidden wealth—steam plies its vast motive power, and electricity lends its wings of light to assist in the search—and so the great mountain yields more and more of its shining splendor to the demands of men.

Truly is this mountain one of the divinely written pages of God.

Aspen, Colo.

A Considerate Mother.—"My dear," said a frightened husband in the middle of the night, shaking his wife, "where did you put that bottle of strychnine?" "On the shelf next to the peppermint." "O Lord!" he groaned, "I've swallowed it." "Well, for goodness' sake," whispered his wife, "keep quiet, or you'll wake he baby."—*Ex.*

Young Folks' Column.

Dollie.

She sports a witching gown
With a ruffle up and down
On the skirt.
She is gentle, she is shy,
But there's mischief in her eye;
She's a flirt.

She displays a tiny glove
And a dainty little love
Of a shoe;
And she wears her hat atilt
Over bangs that never wilt
In the dew.

'Tis rumored chocolate creams
Are the fabric of her dreams—
But enough!
I know beyond a doubt
That she carries them about
In her muff.

With her dimples and her curls
She exasperates the girls
Past belief;
They hint that she's a cat,
And delightful things like that,
In their grief.

It is shocking, I declare!
But what does Dollie care
When the beaux
Come flocking to her feet,
Like the bees around a sweet
Little rose?

Our Three Pets.

We had many pets at Oak Grove farm, and some of them had pleasing peculiarities. Pet number one was Nig—not an old black cat that is usually given this name, but Nig, the black rabbit. He had a mate once, a cunning white one, but one day a neighbor's old Tommy reached his paw under a pile of old lumber where the two pets had secreted themselves, and pulled Snowball out, and put an end to her brief life. The little Nig was left alone, and grew so wild that the children could not pet him any longer. In winter he made his headquarters in the mow of the old barn, and in summer he had a burrow under the barn floor.

Nig never failed to be on hand when the hens were being fed with corn, and always got off with a full share. If anything should frighten him, he would "snap" his hind legs on the ground, and in a moment was out of sight under the barn. When he wanted water he would seek out a pail of water left on the floor for his use.

Little Nig dwelt in lonely bachelorhood on our farm, and grew fatter and fatter for a number of years, and was a real pet of the children, although he could not be handled.

But poor little Nig's life was put to an end. One day our neighbor's old Lion conspired with our Spot, and after much barking, growling and digging, they ferreted him out of his burrow and killed him, much to the regret of all the children.

Ponny was the name of pet number two. It came to Oak Grove farm one day while the hens were being fed at the door. It was a lovely brown pigeon which came to us for a home. After helping itself to corn with the hens on its arrival, it selected a roost over the old-fashioned chimney in the porch. Here it kept away from the cats. It was quite tame at first, and would let us fondle it. But it gradually grew wilder, in spite of our good treatment, and took up its abode in the woodshed.

Sometimes Ponny would dart out into the field with the hens—we had no other pigeons—and search for grain on the newly sowed land.

Hawks were numerous, and it was not unfrequent that Ponny had narrow escapes from being caught away from its roost by these ugly birds. But Ponny was rapid in flight, and when attacked by a hawk it would rise straight up into the air, make a peculiar snap of its wings, and then dart in a zig-zag manner from its pursuer until it reached its home in the shed, where its cooing soon indicated that it had succeeded in getting safely away from its antagonist.

Many years was Ponny a pet on our farm, but as it waxed old in years it became infirm, and one day Mr. Tommy came creeping up through the shrubbery, and poor pet number two was made his prey!

Pet number three was a most peculiar little creature. It was a handsome little flying squirrel, which the boys found in a nest in the top of a tall pine when "Pine Knoll" was being cleared off. The boys brought it home in one of their caps, and put it in a large wire rat-trap, as they had no cage.

We named him "Billy, the spinner." A queer name, yet it was appropriate, as you will see.

Billy, the spinner, like all flying squirrels, slept by day, buried deep in his nest of cotton-batting, and by night would come out for exercise.

Its cage, or rather trap, was placed on an old, unoccupied table in an unoccupied room. So we used to take a lamp and go in and see it maneuver every evening. It could not make an ascent by use of its four wings, but would climb up by the wood-work, and then fly down upon different objects. Sometimes it would alight on our shoulders. We gave it plenty of corn, acorns, beechnuts, etc., and it would pile them up in corners of the windows, where it would eat them at leisure.

One night, after all the family had retired, the old spinning-wheel, which had been left in the squirrel's room, was heard turning around as if grandmother was actively engaged in spinning some stocking-yarn. Those who heard it were a little startled at this occurrence, and immediately lighted the lamp to investigate the matter.

On opening the door, lo and behold! there was our pet number three—Billy, the spinner, indeed—exercising himself on the wheel, making it revolve with lightning rapidity by keeping itself on the rim outside of the spokes. Whenever it wanted to stop the wheel it would jump up on the hub and it would soon stop.

So you can see why we called the squirrel "Billy, the spinner." Well, Billy kept up its antics on the spinning-wheel every night for a long time, much to the pleasure of the children.

We kept Billy for about a year, but at last concluded to set it free again, and so we carried it out into the grove near the house and gave it its liberty.

It was nearly a year after this, and we had forgotten almost about Billy, when one evening as mother sat by the window sewing, what should suddenly make its appearance through a broken pane of glass in the window but "Billy, the spinner!" It came into the room, ran about the table, played around the windows, and then quickly made its exit through the aperture by which it came in, and it has not been seen since.

Good Health.

Influence of Earthquakes on the Human System.—A very interesting communication to the *Medical News* has been made by Dr. F. Peyre Porcher, of Charleston, on the influence of the recent earthquake shocks in that city upon the health of the inhabitants. In addition to the natural alarm and fright which were quite universal, some persons were attacked with nausea and vomiting, which recurred or persisted in several cases for days. Two gentlemen on the islands, 80 miles from Charleston, had their eyes filled with tears not to be repressed, but not caused by alarm or fears for their personal safety, for the danger there was not imminent. Many persons experienced decidedly electrical disturbances, which were repeated upon the successive recurrence of the shocks. These were generally tingling, pricking sensations, like "needles and pins," affecting the lower extremities. One gentleman was completely relieved of his rheumatism; another, who for months was nervous, depressed and entirely unable to attend to business, regained his former activity and energy. Several cases of mental disturbance, owing to anxiety and prolonged loss of rest, some of them persistent, occurred among Dr. Porcher's patients.

Digestibility of Breadstuffs.—Dr. Walzen Muller, the German physiologist, remarks upon the common idea that an admixture of bran with flour renders the latter much easier of digestion, and asserts that the smallest comminution of the grain, as well as the amount of husky portion retained in the well-known Graham flour, produces a slight irritation of the digestive organs, which results in the separation of the pepsin from the husk of the grain, admitting of its mixture with the gastric fluids, thus greatly facilitating the process of assimilation; this mechanical irritation, particularly in the case of the aged and weak, being otherwise producible only by the use of alcoholic and similar stimulants. Dr. Muller is of the opinion that bread should not be made without salting, for the reason that the starch of the flour contains a large amount of salt of potash, which neutralizes much salt in the system. Again, dry bread which has been baked some little time is most healthful, as the chewing process must of necessity be thorough and the bread consequently fully salivated previous to its entrance into the stomach. He also particularly urges the desirability of mixing the dough of bread with milk.

Substances in the Eye.—Everybody has experienced the pain and annoyance of "something getting into the eye." What should be done when this happens? In the majority of cases, if the sufferer has the patience to close the eye gently, and keep it immovably closed for from five minutes to a quarter of an hour, the offending particle will be safely and painlessly washed away by the tears which the eye will naturally shed.

Cure for Biliousness.—For biliousness the editor of the Boston *Medical and Surgical Journal* says a plain diet of bread, milk, oatmeal, vegetables and fruit, with lean meat and fresh fish, is best. Exercise in the open air. The victim of an acute attack will be righted by (1) abstinence; (2) porridge and milk; (3) toast, a little meat and fish and ripe fruit, thus coming to solid food gradually.

Glycerine for the Ear.—Glycerine has been highly successful in diseases of the ear, from its possessing the peculiar property of attracting the atmospheric moisture, and consequently never drying or hardening.

Domestic Economy.

Tamales.

Most old residents of the Pacific Coast have prospected and experienced the "tamale," but there are many to whom the word "tamale" conveys no meaning—persons recently from the Atlantic side of the continent, generally.

The tamale is a Mexican invention. It shows in its construction that it was of Indian origin—the device of a people among whom the art of cookery was in its infancy. The eatable part of a tamale is composed of coarsely hashed chicken and a sort of dressing made of cornmeal, raisins, pepper and olives. A small quantity of this mixture—enough to make a roll about the size of an ordinary ear of Indian corn—is then covered with cornmeal batter and rolled up in clean cornshucks. The shucks are firmly tied at each end, and the tamale then looks like a big ear of corn in the husk. A quantity of tamales so constructed are then put into a kettle and boiled. When done, it will be found that on opening out the cornhusks the tamale is enveloped in a cornmeal crust and looks like a small pudding boiled in a bag. The Spaniards probably improved upon the original Indian tamale by adding to it the raisins and olives, but the pepper of the olden time is still retained, and to the person experiencing the tamale for the first time is its most striking feature.

The Mexicans often leave out the raisins and olives in the composition of their tamales, but never the pepper. Without the pepper the thing would not be a tamale. The quantity of pepper used is not great, indeed is small in comparison with what is put into many Mexican dishes. Most Americans like the tamale from the start. When properly made it is a most appetizing as well as most satisfying dish for a midnight lunch. The tamales, all hot and steaming, are placed in baskets, covered up with cloths and napkins, to retain the heat, and peddled about the streets like hot corn.

The peddler, generally a Mexican, carries with him a few plates and knives and forks. His customer seats himself wherever he can find a place to sit down; on a chair in a saloon, or on a box or the edge of the sidewalk out of doors; a napkin is spread on his knees, the plate and knife and fork placed thereon, and the table is set. The Mexican then cuts one end of the cornshuck envelope and taking hold of the other shakes the tamale out upon the customer's plate. He then patiently stands by until the tamale is devoured, when he "clears up the table," packs his dishes into his basket, hangs the basket upon his arm, and strides away with a cry of "Ta-ma-a-l-e!" that rings for blocks through the town.—*Dan de Quille, in Territorial Enterprise.*

Tested Recipes.

Editors Press:—I will send you a few more recipes:

Rice Pudding.—One cup sugar, 8 cups milk, 1 cup rice. Bake until the rice is soft; when cold, flavor with vanilla.

Soft Ginger Cake.—One cup sugar, 1 cup of molasses, half-cup of lard or butter, 1 egg, 1 cup hot water, 1 teaspoonful of soda.

Caramel Cake.—Three cups sugar, 1½ cups butter, 1 cup milk, 4½ cups flour, 5 eggs, small teaspoonful soda.

Gubserville. Mrs. W. C. Bucknall.

Meringue.—Take the whites of as many eggs as you like—four will be enough to cover a large dish. Allow one-half tablespoonful of sugar (pulverized is best) to each egg (if you use much sugar the meringue will be less light), and after beating them stiff add the sugar. Beat only just enough to mix it in. Spread the meringue over a pudding or whatever you like, and set on the top shelf of the oven, which should be very hot. Watch it closely, for it will brown in a moment, and if not removed at once will burn. It should be only a yellow-brown, not a dark-brown. It is best served as soon as perfectly cold.

Fried Sweetbreads.—Sweetbreads should be laid in warm water with a pinch of salt in it, for half an hour, to make them white. Put them into cold water and let them remain over the fire until they have boiled ten minutes. Cut them into slices, brush them with an egg and sprinkle over with bread crumbs. Fry them in butter. Each sweetbread will require an ounce of butter. Serve dry, or with a rich gravy, as for a fowl.

Cup Cake.—Two eggs, two cupfuls sugar, one-half cupful butter, beat smooth, add two scant cupfuls rich milk and five cupfuls of flour with four teaspoonfuls baking powder, flavor with lemon and pour half of it into a square loaf tin; have three tablespoonfuls of melted chocolate ready and stir it in streaks through the remaining batter; pour into a corresponding form and bake slowly 30 minutes for marble cake.

Quince Cider.—A very pleasant beverage can be produced as follows: Take a quantity of ripe quinces, cut into quarters, and with the pips, etc., removed. Boil these in a copper with double their weight of water; when boiled to perfect softness, pour the must into a vat.

The Week.

The last note of the week is best of all. Just as we go to press on Wednesday afternoon the rain is falling, and the signs of the last few days in clouds and lunar halos are redeemed. We trust the rain will be general and generous, for the drier lands have been showing need of refreshing and everywhere a drenching will do much good. During the last few days crop notes and comfortable outlooks of all kinds have been hinged upon ample spring rains, and now one may expect, if the clouds hold out well, that all the good things prophesied will be realized.

The most sensational event of the week was the burning of Del Monte hotel at Monterey, which cast out about 300 people upon the grounds at midnight. Fortunately none were harmed, though much property was lost and the building totally destroyed. We are told that a new and larger Del Monte will be ready by September 1st.

There is still much doubt about new freight rates and their effect upon produce. There seems to be a general belief that the Interstate Commission may see a way to apply the law so as not to hurt the staple products of California, which must seek a distant market.

American Farmers and their Apparent Destiny.

Much is being said in private circles and through the newspapers of the country in regard to the manner in which the public lands are being "gobbled up" by large capitalists, both native and foreign. Just now the cry is against allowing "foreigners" to come in and buy up railroad lands and Government lands in large tracts for cattle-raising, and with the further evident purpose of holding them for future use for farming purposes as the country in their vicinity becomes settled up by newcomers and others seeking homes in the "far West." The idea is that these vast tracts of land will in the near future be divided up into small holdings—not for sale, but to be let out to tenant farmers after the manner of such farming in Ireland, and out of which practice the great evil has grown which is now shaking old England to her very center. That such things are possible in this country has been fully proven by the old Patroon troubles which so seriously vexed Central New York a few years ago, and which at one time threatened to involve the State authorities in a bloody conflict with a large body of tenant formers. If a single large land-holder can produce so much disturbance among a people of comparatively quiet habits, what might not the large number that are now coming to the front do in the presence of a people far more excitable and uncontrollable than were the "barnburners" of New York during the few years immediately following the census year of 1840?

But there is another and still more serious trouble in regard to our farming interests which is beginning to force itself upon the minds of serious and reflecting people. We refer to what appears to be a gradual but comparatively rapid diminution in the number of our farm landholders in the old populated States, both on the Atlantic and in the Mississippi and Ohio valleys. We have been accustomed to speak of the farmers as constituting the "great balance-wheel" of our industrial population and of our political machinery as well—that they exert an important moral influence throughout the country. And, indeed, such have been the facts, and, in the interest of the national welfare, such they should continue to be. It is generally supposed that we have an enormous number of land-owning farmers, and the census figures are sometimes quoted as proving such to be the case. For instance, the census report of 1880 gives the following figures:

Number engaged in agriculture, including everything	7,670,483
Number of farms and plantations	4,008,907
The remainder gives farm laborers	3,661,586

The figures, as there placed, give us a very encouraging view of the situation. But figures may sometimes be correctly given, yet so placed as to convey very erroneous impressions. An Ohio correspondent of the *National View*, a Washington publication, has been analyzing these and other census figures with the following result:

After quoting the above figures, the correspondent says:

By the same Census Report of 1880, I find that there were at that time, of tenant farmers, 1,024,601.

The number of farms and plantations, the reader will notice, amounted to	4,008,907
Subtract the tenants	1,024,601
Leaving nominal farmers	2,984,306

But this does not show the actual facts, for the mortgage tenant I have not included, and no fair estimate can be made with him left out, for *usury* is driving him into the ranks of the tenants.

The owner and worker of a farm and the tenant farmer are two very different and distinct individuals. One is, in fact, a capitalist, and the other is a laborer in every sense of the word, usually at the bottom rung of the ladder. Hon. B. F. Shively, of Indiana, estimated recently that 20 per cent decrease of owning farmers may now safely be added to the tenant class, which I consider too low, from what I know of mortgaged farms in this State—Ohio.

This estimate of Mr. Shively's would reduce the number of actual owners and workers of farms to 2,387,445. Let me illustrate the grip the mortgages had on the farmers of Ohio in 1884 and 1885; the year 1886 is not at hand. For 1884, 33,000, to secure $50,000,000; for 1885, 26,821, to secure $30,905,262; for 1886, it is thought to be larger. In addition to this, the cities, villages and towns had nearly the same for these years. For 1884, 31,382, to secure $35,204,782; for 1885, 24,452, to secure $20,904,439. Without absolute and exact figures at hand for this date, it has been estimated that not over 150,000 farms are farmed by the owners in this State. In 1860 official reports show 277,000. Thus it will be seen that the "American farmer," as we have known and boasted of, is doomed.

There is no country I know of with one-half of our population, and claiming modern civilization, but can discount this country in the number of owner and working farmers. France has about three to one of our number, according to a recent number of the *Industrial Review*, published at Paris, France. The "best banking system the world ever saw," borrowed from England during the war, is confiscating the farmer's land much faster than most people imagine. In this State—Ohio—the official records show that only a fraction of over half of the mortgages recorded are canceled by payment; the balance is sold by the sheriff.

There is so much talk about our many millions of farmers in the United States, and the impression given out that this class is in a thriving and healthy condition, that it is important to tell the truth, disagreeable as it may be.

At another time I will more fully go over this subject and give facts and figures from official sources. Only recently a committee of the Connecticut Legislature developed the fact that six insurance companies of Hartford held $50,000,000 worth of mortgages on Western farms. If only six companies held this vast amount of cut-throat instruments on farms, what must be the total amount held by the numerous Shylock institutions in the whole country?

California Best of All.

We had the pleasure of a few moments' talk the other day with Mr. C. J. Cressy, the well-known California agriculturist, who has just returned from a visit of some weeks to some parts of New England and the South. It took only a moment to ascertain that Mr. Cressy returns with renewed love for California and renewed pride and confidence in the country where he has bestowed so many years of sterling effort, and has achieved such signal success. Such being his upmost thought—one of loyalty to California—we thought we might serve our readers well by drawing from Mr. Cressy some of the reasons for the faith he holds in this State.

We asked him of agriculture in New England. He left Boston on March 22d, and on that day there fell in New England a foot of snow in addition to five feet of earlier snow that still remained in the rural districts of Maine and New Hampshire. It has been one of the hardest winters for 30 years. For the farmer of New England, from an agricultural standpoint and as a business proposition, the land has no value. The labor and fertilizers used in producing the crops at a fair valuation cost more than the products will sell for. They manage to make a living because they put in all their time, and thus get their board for their time. Their flour, their meat, their grain for their animals, all come from the West. They have to buy almost everything they have to use. The country is thickly settled, and the cities grow larger and more wealthy from manufacturing. We can learn from them the advantage it would be to us to establish more manufactures here where the raw material is produced. We ship them raw material and they ship the manufactured products back. Eastern cities are full of money; people have more than they know what to do with. This is the result of their trade and manufactures, not from their agriculture.

Turning to the South, Mr. Cressy reports the course of affairs, at least in the parts he visited, as very slow and unsatisfactory. In other parts there has come in a certain amount of capital and enterprise in manufacturing which promise well, perhaps, but in the great cotton region of Georgia, for example, there is the same struggle to get a livelihood out of cotton of which it takes three or four acres to produce a bale—or about 500 pounds to four acres, selling at 7 to 8c. per pound, a price far too low to pay a fair return for labor—not to speak of $3 to $4 per acre which has to be paid for commercial fertilizers. The consequence is the cotton-growers are poor and in debt, and the land has very little value. Cotton lands can be bought for $3 or $4 per acre. Their implements are 100 years behind the times. Improved machinery such as we use in California, they know nothing of. They could not use it there, because the fields are small and the country full of trees and stumps. They simply *deaden* their lands, not clear them. The stumps being pitch, never rot out, consequently they are deprived of the use of machinery as we have it in this country.

Another reason for the poverty of the country is that they are obliged to bring in everything they need instead of producing and manufacturing it. Mr. Cressy said he was curious to get information on that point, and was told by the purser of the steamer that that one line carries 150 tons of bacon a week from Boston to Savannah. The hogs come to Boston from the West. Such business is what builds Boston up. They have trade which does not properly belong to them, because bacon could be taken to Georgia from nearer points, but Boston energy and persistency holds on to the trade which enriches the city. Mr. Cressy says that his observation sustains the common report that Florida is being left out in the cold and that the tide of travel and immigration has turned strongly to California. It is being clearly seen now at the East that California soils are better, the range of production much greater and the expensive employment of fertilizers avoided. Our climate, too, is better, and, while all the semi-tropical fruits can be grown here, we have a climate in which one can live in comfort and health all the year round.

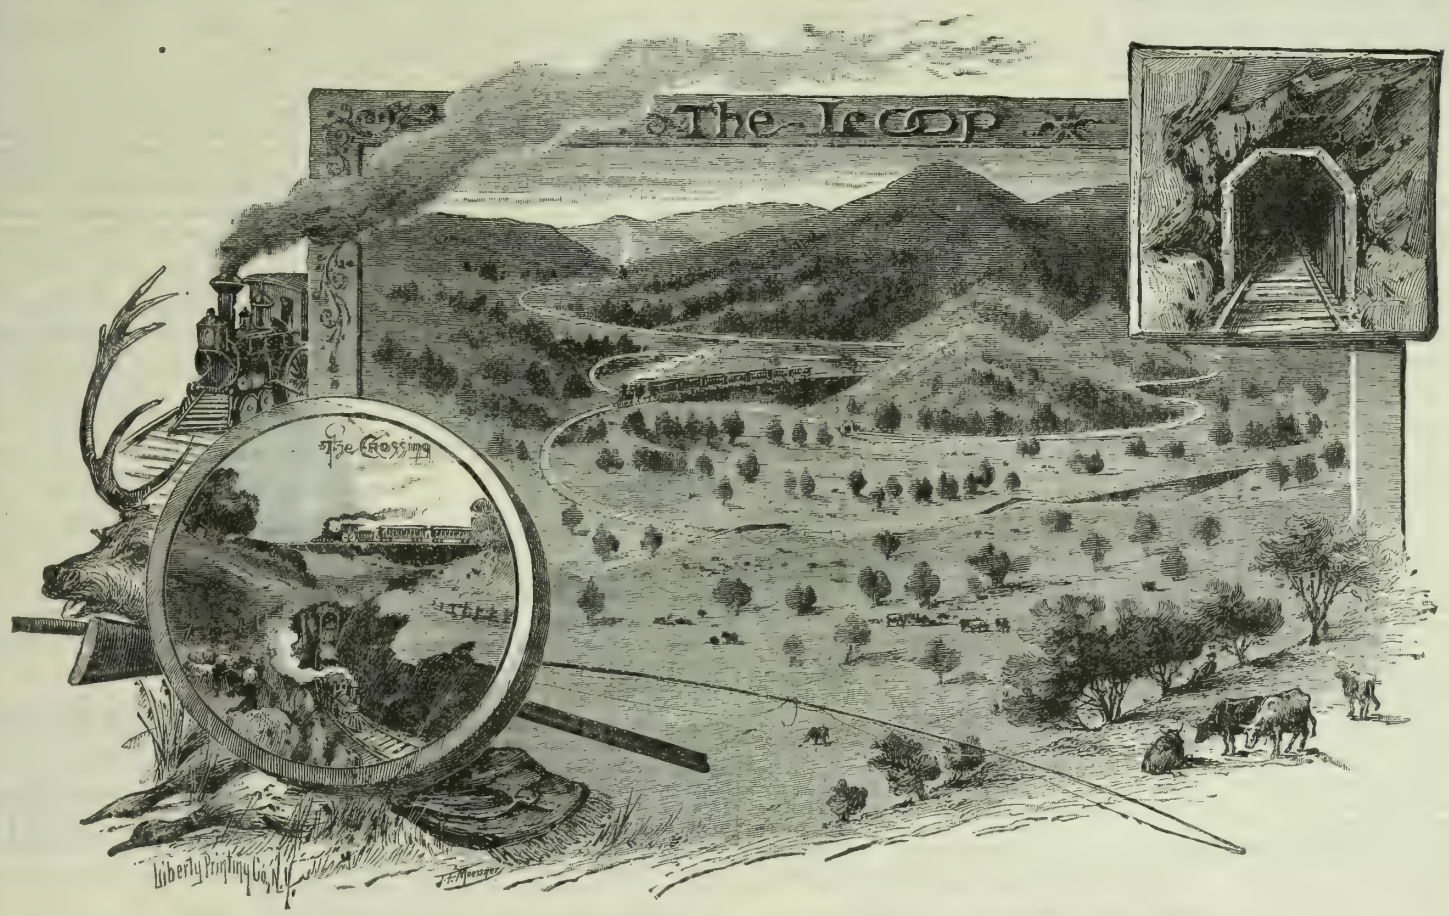
In Mr. Cressy's judgment, there is no comparison between California and any place he visited, so far as opportunity for enterprise and investment for money-making is concerned. He saw no place that compares with California in agricultural products. At the East and South they farm their little pieces of ground by hand labor; we do it on a scale so large we can use the best machinery and there can really be no competition. They feed their cattle and horses for six months in the year, and keep them in barns which have to be nearly as comfortable as their houses. Ours live outdoors, and when we want our beef crop we go and get it.

The field for enterprise and investment in California, as compared with other parts, can be learned from the very fact that so many people are coming from the East to invest here. They are, for the most part, shrewd business men, who have made their money in professions, or in trade and manufactures. Comparatively few middle-aged farmers come here from the Atlantic Coast, because it is impossible to sell Eastern farms to any advantage. Those who own them make their living, as shown above, by hard and constant work, but they cannot sell out for enough to move their families here. Young, unmarried men from the agricultural districts at the East are coming here. Mr. Cressy says he always brings some of this class when he returns from the East, and almost without exception they have done well, as they have had the right kind of material in them. The contrast in wages here and at the East Mr. Cressy mentioned. He said that in the South a young man is worth from 40c. to 50c. per day; a young man here gets from $1.50 to $2 per day. Now that the grain lands are being planted to vines and fruit, they give work all the year, and the increased attention to stock-raising has the same result. When wheat is the only thing raised, work does not last all the year, but things are changing.

Mr. Cressy was clearly of the opinion that the upper parts of the State should be better advertised. He came through with a large excursion party, and, beside himself, only one young lady came to San Francisco—all the rest went South. People do not know anything about important northern regions, only Santa Barbara, San Diego and Los Angeles.

Mr. Cressy returns with all his old spirit and vigor, and feels that he has been losing time while visiting. No doubt he will make up for the indulgence by a most active summer's advancement of his many and wide interests in this State.

THE first strawberries of the season were received in S. F. by Geo. R. Starr & Co., March 31st, from English & O'Brien, Bouldin island. The consignment sold at the rate of $3 per pound.



ONE of the oddities in the freight business is the recent shipment of a carload of lemons from New York for this city, to come over the Union Pacific.

On the Way to the South.

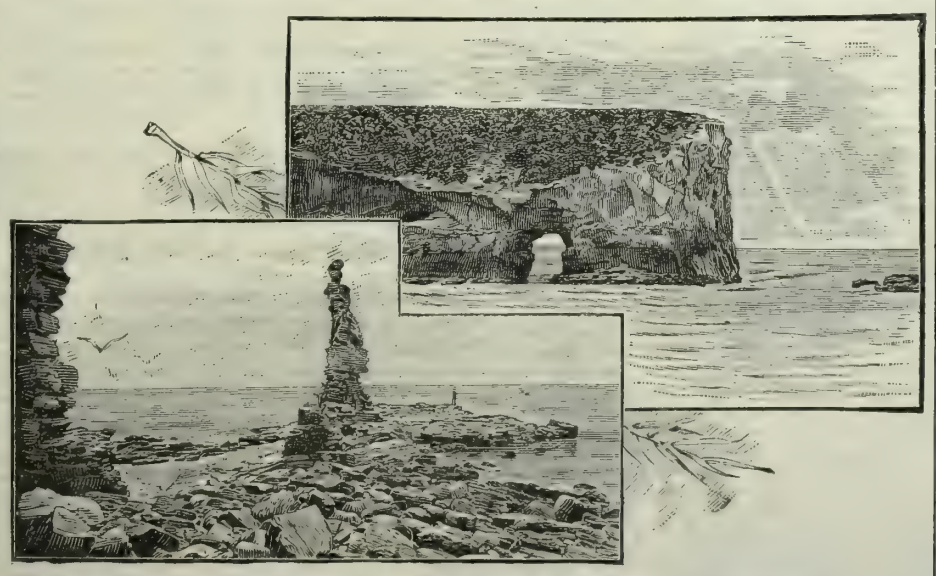
We hope quite a number of our readers will find it convenient to take a trip to the south at the close of this week, to attend the Horticultural Convention and Citrus Fair which will open in Riverside April 11th and continue during the week. The meetings, as has been previously stated in the RURAL, are to be held under the auspices of the State Board of Horticulture as one of the two conventions provided for by the State law. Many should avail themselves of this occasion and of the reduced fare which is offered by rail and by steamer to visit the south and observe for themselves the wonderful growth and progress about which so much has been written in our columns during the last few years, and especially within the last twelvemonth.

Supposing there will be quite a disposition to take this journey, we select for illustrations upon this page two views, one which the traveler will pass through if he goes by rail; the other a coast view, of which many will be enjoyed by those who choose to go down by steamer.

The upper engraving shows the famous loop in the Tehachepi mountains. It is counted one of the country's grandest monuments to modern railroad engineering. The ability and skill seen in this work from a scientific standpoint has been the subject of repeated comment by the leading technical journals of the world, and the newspapers continually recur to this unique piece of work and the signal success of the engineers who ran the lines. Tehachepi, 120 miles from Los Angeles, is the highest point on the railroad (3964 feet) between San Francisco and Los Angeles. The name signifies the coming together of the mountains of the Sierra Nevada and Coast Range. Between Tehachepi and Caliente, 26 miles further west, is the "loop," its great peculiarity being that the road, in climbing the elevation, is made to cross itself. Its exact location is 352 miles from San Francisco, or 130 miles from Los Angeles. The length of the loop is 3795 feet; lower elevation at tunnel 2956 feet, and upper elevation at grade over tunnel, 3034 feet; difference in elevation, 78 feet. The engraving (from Major Truman's book describing the Sunset route of the Southern Pacific Co.) shows the general features of the loop, the entrance to the tunnel and the crossing. Inquiry at the engineering department of the railroad company here develops the fact that this Tehachepi loop was the first one of the kind ever made, and the plan was devised and carried out by the engineers of the company.

THE LOOP IN THE SOUTHERN PACIFIC RAILROAD, AT TEHACHEPI, CAL.

On leaving San Francisco bay, through the famous Golden Gate, a fine view is presented of that historic portal. One can obtain, from the ocean point of view, a much better idea of the harbor entrance than from the hills on either side. The steamer passes close outside of the Seal rocks, and in its southern course soon passes Point Montara, where there is a fog signal. Four miles below is Pillar Point, behind which is Amesport Landing or Half Moon bay.



Pigeon Point, the next noticeable landmark, has a lighthouse of the first order and a fog signal. The country in the vicinity of this point is a fine potato-raising section, and there are some sawmills near there also. New Years Point (or Ano Nuevo) is 18 miles above Santa Cruz, and is another fog-signal station. Another lighthouse is met at the point at Santa Cruz. Here opens the wide expanse of Monterey bay, around the edge of which are many settlements of more or less note. At the northern extremity is Santa Cruz, and at the southern, Monterey, where so many tourists gather every year.

After crossing Monterey bay and passing Point Pinos, the small bay of Carmel is passed, a place where formerly the whalers had a rendezvous. Between that and San Simeon is Point Sur, a high, round-topped point connected to the mainland by a low neck. Then comes Piedras Blancas (white rocks), where there is a lighthouse marking the northwest point of San Simeon bay. Near San Simeon is a whaling station, and just below is the town of Cambria, where small vessels land for dairy produce, etc. Twenty miles further south is Cayucos, a small place whence dairy produce, wool, hogs, etc., are shipped to San Francisco. Below that is Moro bay, and then San Luis Obispo harbor, or Port Harford.

After leaving San Luis Obispo harbor, several small landings are passed, and the ocean traveler sees Point Arguello, the scene of the famous shipwreck of the Yankee Blade in 1854. Twelve miles further south is Point Conception, which forms the dividing line between the southern and northern climates. Strong winds are apt to be the rule for summer north of this point, but once south of it the air is warmer and pleasanter. From this point south as far as San Buenaventura there is a belt or streak of kelp all along the coast.

The next place of interest is Santa Barbara, where the steamers stop. Then come Carpinteria and San Buenaventura. Between Point Magu and San Buenaventura, about half-way, lies Point Hueneme, which, with Anacapa island in front of it, makes the eastern entrance to the Santa Barbara channel, through which the southbound traveler has been sailing many miles. It is the off-lying islands that make this channel, which is more or less protected from severe ocean swells. Numerous submarine oil wells also help to keep the waters smooth.

In the center of the long curve of the coast from Point Duma to Point Vincent, is the town of Santa Monica, on Santa Monica bay. South of this is Point Fermin, the lighthouse of San Pedro harbor, the seaport of Los Angeles. The traveler lands here at Wilmington and goes by rail to Los Angeles. Or if he chooses, he goes on past Anaheim and Newport to San Diego, and takes cars there for Riverside and other points in San Bernardino county.

WAVE SCULPTURE AT SANTA CRUZ AND SANTA MONICA.

The engravings give a near view of some of the wave sculpture which may be seen on the coast, the natural bridge at Santa Cruz and the statue at Santa Monica. Similar creations in the rocks are found everywhere up and down the coast.

IT is estimated that 90 people were frozen to death in Dakota last winter.

Seeking Truth in California.

As many of the people now reaching California from the East come with a purpose different from that which actuated former arrivals from that quarter, it is to be expected that they will examine into matters and things here in a more careful and scrutinizing manner. A large portion of the present immigration come to buy land on speculation, or to settle and make their homes here; wherefore it behooves them to proceed with caution and avoid mistakes at the start. And this, it may be observed, they seem disposed to do, the most of them acting in a prudent and business-like manner. Instead of accepting statements in an off-hand way, as was once the case, they listen to what others have to say and then carefully inspect matters for themselves. Even the pleasure-seekers, tourists and such as come here for temporary sojourn appear to be less credulous than formerly, discounting much that is told them about California in a way indicative of a skeptical state of mind.

Such being the case, it would be well for the old resident to hereafter avoid, in his descriptions of objects and events, undue amplification. He might perhaps find it expedient to even abate something from the weights, measurements and big figures by him heretofore adopted. If he cannot consent to reduce the size of the Big Trees, he might at least consent to their honest measurement by taking their girth a few feet above the ground, instead of down at its surface, where they have been abnormally enlarged by the exposure of the roots, through the washing away of the earth around them. Certain other data, generally accepted might, in like manner, suffer some change without serious detriment to the cause of truth.

But, after all, we don't see why these, our Eastern visitors, should be so captious about what we Californians have to tell them, putting a literal construction on all we say and exacting proof of its correctness. It is in no such spirit we listen to their recitals. When the Boston man tells us about Bunker Hill monument, depicting in glowing terms its hight, its symmetry and its vast proportions, do we question what he says? By no means; but hearing him through, exclaim, prodigious! sorrowing that California has no such pile, and wondering if there is elsewhere in the world anything like it! When the New Englander describes to us the sea serpent that makes his annual appearance off Nahant shoals, do we shrug the shoulder or exchange with each other the knowing wink? And when the Philadelphian grows enthusiastic over the old Liberty Bell, are we the people to cry out, "Yes, but the thing is badly cracked!"

Certainly not. On these and all like occasions we have shown ourselves to be patient, tolerant and polite, expressing a due degree of wonder at what has been told us, and indulging the well-affected laugh when it was intended to be humorous. Nor have we, while exercising so much good nature, ever sought, certainly not more than once or twice with any success, to palm off on these strangers a woolly horse or a live mermaid. Amenities like these should, we hold, meet with proper recognition and appreciation, despite the modicum of untruth and self-glorification practiced on both sides.

Entomological.

The Red Scale and the Gas Remedy.

In a paper recently read before the Los Angeles County Pomological Society, by D. W. Coquillett, entomologist of the society, we find a most excellent and popular description of the life history of the scale insect, and an important statement concerning a newly tested method of killing the scale. We quote as follows:

Southern California in general, and Los Angeles county in particular, is infested with a comparatively small number of different kinds of injurious insects; of these the most prominent ones belong to a group commonly called "scale insects," from the fact that the greater number of them are covered with a thin shell, or scale. Of this kind is the red scale (*Aspidiotus aurantii*), a pest too well known in this part of the State to require an extensive description; suffice it to say that it is considerably flattened, of a light reddish color, the scale of the female being nearly circular in outline, while that of the male is smaller and more elongated.

To the casual observer these insects appear as small blisters, or excrescences on the fruit or tree, being to all appearances wholly devoid of animated life; and yet if we study them more closely we shall see that they are endowed with life the same as any of the higher animals.

Growth of the Insect.

The female red scale deposits eggs which are in such an advanced state of development as to be scarcely worthy of the name of eggs, since they hatch out so soon after being deposited—in the summer season seldom requiring more than a day from the time they are deposited until the young ones issue from them. The young are provided with six legs and a pair of antennæ, or feelers, and closely resemble the young of spiders. After issuing from the eggs they remain a day or so beneath the parent scale, and then start out in search of a suitable place in which to take up their abode; they seldom wander far in search of such a place, which is usually a depression or hollow in the fruit, if any fruit is at hand, otherwise they settle indiscriminately upon the leaves and bark. Here they soon insert their beaks and proceed to imbibe the sap; the beak consists of three exceedingly fine, bristle-like organs, controlled by a set of powerful muscles, and when the insect wishes to insert them he first brings them together and then gradually pushes them into the fruit, leaf or bark, as the case may be, the three separate parts thus brought together forming a hollow tube, through which the sap is drawn.

In a short time there issues from all parts of the young scale insect's body an innumerable number of short and very fine waxen threads which unite next the body, and being shortly joined by others, soon form a whitish covering, or scale; this excretion takes place very rapidly in the summer season, the insect becoming wholly concealed from view within 12 hours after the insertion of its beak. This excretion is on the under as well as on the upper side of the body, so that the insect is in due time encased between two shells or scales, somewhat as a turtle is. The two scales are not so closely joined together at the sides as to exclude the air, this element being as essential to the life of the scale insect as it is to any of the higher animals. Like bees and butterflies, the scale insects breathe through a series of spiracles, situated on each side of the body.

After the young scale insect has increased somewhat in size it casts off its old skin, and with it is also cast off the legs and antennæ, so that the insect now consists simply of a sack of animated matter, its only visible organ being its beak. When one of these insects is carefully removed from its scale the insect will usually remain suspended by its beak, which is finer than the finest hair and scarcely visible to the naked eye.

In the case of the female scale insect, no other important change occurs, except a second casting of the skin; but the male insect passes through a quiet pupa state, and finally issues as a minute, two-winged fly. Among the hundred thousand members of the vast class of insects, there is not another group in which the different sexes are so dissimilar as they are among the scale insects. Here is the male, a sprightly, two-winged fly, provided with a full complement of legs, antennæ and eyes, while his better half is destitute of even a trace of legs, antennæ or eyes, and is destined to be imprisoned during the term of her natural life in the scaly house which she herself builded.

In due time the eggs are deposited, and from personal observations I am led to believe that each adult female deposits only one egg a day, and in the summer season this hatches out within 24 hours after being deposited.

There appears to be from four to five broods, or generations, produced in one year, but there is no distinct limit between the different broods, the insects being found in all stages of development every month in the year.

Historical.

As near as can be ascertained, the red scale was first introduced into Los Angeles county in the year 1879; it was brought upon some lemon trees purchased in San Francisco, and said to have been imported from Australia. Prof. J. H. Comstock, formerly entomologist to the Department of Agriculture, but at present instructor of entomology in Cornell University, obtained specimens of the red scale from New Zealand, where it occurred upon some orange and lemon trees imported from Sydney, Australia; and, upon comparing these specimens with others from Los Angeles, found them to belong to one and the same species. He cites an instance where an infested orange grove of 33 acres in Australia rented for a little over $8700 per annum nine years ago, while six years later only $580 rental per annum could be obtained for it. It thus appears that the red scale is quite as destructive in its native home as it is in this—the land of its adoption.

The first indication of any serious results produced by its attacks upon the tree is seen in the falling of the leaves, shortly followed by the death of the smaller twigs, especially of those at the outer ends of the branches. This is continued until all of the branches, and finally the trunk, succumb to the attacks of these Lilliputian foes.

A well-known peculiarity which always accompanies the attacks of the red scale upon the leaves is the fact that it produces a yellowish-white discoloration in that part of the leaf. This has sometimes been attributed to the extraction of the sap by the insect, but this cannot be the true cause of this phenomenon, else all insects which feed upon the sap of plants, and especially the black and cottony-cushion scales, would also produce a similar discoloration in the leaves which they attack; but this is not the case. It seems more probable that the red scale, like the common mosquito, ejects a small quantity of a thin liquid into the wound it makes, in order to dilute or make thinner the sap of the tree, so as to be able to imbibe it through the minute opening in its beak; and some of the liquid thus ejected is carried by the sap beyond the reach of the insect's beak, and produces the discoloration always observable in leaves attacked by these insects. The same thing occurs in the case of the attacks of the pernicious San Jose scale upon the bark and fruit of various kinds of deciduous fruit trees, except that the discoloration made by the latter species is of a reddish instead of a whitish color.

No internal parasite is known to attack the red scale, and the only insect I ever saw preying upon it is the two-spotted ladybug (*Chilocorus bivulnerus*), which both in the larva state and as a beetle tears open the scales and feeds upon the inclosed insects.

Various Washes.

But it is the remedies we are most interested in, and in this connection I may state, without fear of being contradicted, that no part of orange-growing has been more expensive to the grower, and so unsatisfactory in its results, as the spraying of his infested trees with the different washes for the destruction of the scale insects upon them.

The active principle of nearly all the washes employed in this State for the destruction of scale insects is of a caustic nature, acting exactly as vigorously upon the tree as it does upon the insects, but as the latter are more easily affected by it than is the tree, the wash necessarily proves more fatal to them, although with such lowly organized creatures as the red-scale insects are, protected moreover by their scaly coverings, the difference in regard to hardiness between the insect and the tree it infests is very slight; in fact, I have known of numerous instances where the bark of infested pear trees had been burned brown and hard by caustic solutions, while the San Jose scale insects, situated in these places, were not killed by the application; and in my experiments with solutions of caustic soda applied to orange trees for the destruction of the cottony-cushion scale, the eggs were not always killed in those places where the bark had been burned brown by the caustic.

Even after the infested orange or lemon tree has been thoroughly pruned, it has been found absolutely impossible to destroy every scale insect upon it by spraying it with the best wash at present known, and using the most approved appliances; this fact has been repeatedly demonstrated by some of the best sprayers in this part of the State. As many as 50 gallons of the wash have been sprayed upon an ordinary-sized orange tree, and yet after the application several scale insects were found upon the tree untouched by the wash, protected, it may be, by a dead leaf wrapped around the twig, or by several leaves so placed as to ward off the spray. I have myself seen an orange tree thoroughly sprayed three separate times at intervals of one week apart, and yet after the last spraying had been completed I found upon it several scale insects that had not been touched by the spray.

Gas Treatment for Scale.

Early in my investigations into this subject I became convinced of the fact that the most perfect wash that could be produced must necessarily be imperfect and unsatisfactory; and shortly after beginning my experiments with various washes for the destruction of scale insects, under the direction of the Department of Agriculture, Mr. Alexander Craw, whose name is familiar to the majority of the fruit growers in this part of the State, remarked to me that the only satisfactory manner of destroying scale insects was to inclose the infested tree in an air tight tent and then to fill the tent with a gas that was fatal to the insects without at the same time injuring the tree. I saw at once the truthfulness of this remark, since the gas by filling the tent must necessarily reach every insect on the inclosed tree, while if the gas did not by contact injure the tree it would not do so at all, as it would leave no deposit on the tree to subsequently endanger its life. Mr. Craw also informed me that for some time past Mr. J. W. Wolfskill and himself had conducted a series of experiments with various fumes and gases, which resulted in the discovery of a gas that proved fatal to the insects without injuring the tree; and that it was necessary to subject the insects to the influence of this gas for a period of from two to three hours. Shortly after making this discovery they devised an apparatus for operating the tent.

Some time after my work for the Department had been completed, I began a series of experiments with gases for the destruction of scale insects, and succeeded in discovering one that proved fatal to the insects confined in it for only 10 minutes. When Messrs. Wolfskill and Craw learned this fact they invited me to join issues with them. This I consented to do, and together we have succeeded in perfecting both the production of the gas and the working of the apparatus for operating the tent. Extensive experimenting has proved that this gas, as now prepared by us, will not injure the tenderest growth nor the blossoms, while it proves fatal to the cottony-cushion scale, red scale, San Jose scale and black scale, and it is as effectual when applied to tall trees as to small ones.

A Recent Testimonial.

The Orange *Tribune* of April 2d says:

The last experiment made by Messrs. Craw and Coquillett, with their gas bug-killer, was much more successful than the first. The trees operated on show no signs of live scale bugs, and the two large ones are not injured in the least by the treatment. Two smaller ones are burned to some extent, but how badly they are injured is yet to be seen. We think the experiment has demonstrated that the gas, if properly applied, will kill *every scale bug* and not injure the tree.

The Woolly Aphis.

Editors Press:—J. A. Patterson, living three miles north of Visalia, while speaking of growing apples here, says that with him the white Winter Pearmain withstands the woolly aphis. He has many varieties in his orchard of about 100 trees. He has only seven or eight of the white Winter Pearmain variety, but on those seven or eight trees he raises about as much as he does on all the other trees of the orchard, owing to the fact that his other trees are all much troubled with the woolly aphis. He also says this tree doesn't drop its fruit as early as most varieties do. The soil here is clayey loam.

L. R. Runyon, six miles northeast of Visalia, furnishes the following recipe for removal of woolly aphis, which he says has been presented to the public by T. H. McNamie, of Lemoore: Take one-half pound Barbadoes or crude aloes and dissolve in one gallon alcohol. Water should not be included. Apply with sponge. In October and November this preparation should be applied to body of tree close to ground. April and May are, however, the best months to do the work, and then the whole tree should be sponged.

Mr. R. has tried this wash on apple trees near Lemoore, and, while it is most effective, he thinks it too costly. He suggests that the tree infested should be cut back and the balance sponged. It is a dead shot, and the cost is the only objection to it. It would be well for persons having woolly aphis to experiment on modifications or slight changes of this formula, with a view to cheapening without deteriorization, and report to the Rural Press.

Tulare Co. McD.

The Field.

Summer-Fallow as a Moisture Saver.

Summer-fallowing for the conservation of moisture has now its advocates in all parts of the Pacific Coast. We have given at considerable length during the last few years the experience and resulting theory in California, and Californians will read with much interest what we shall now quote from the writings of Judge Kennedy in the Walla Walla *Union*. Of course conditions are different in Washington Territory, but there are many principles mentioned which are of general interest. We quote as follows:

For summer-fallowing the ground should be plowed to at least somewhere between six and eight inches. The harrow should *follow* the plow, so that, if possible, the ground should be harrowed twice upon the day when it is plowed, and when the whole plowing is completed it should be harrowed at least twice again. The object of this harrowing, simultaneous with the plowing, is to make a mulch of the surface of the ground and retain what moisture is contained in it, and, as a matter of course, the earlier in the spring the work is commenced and the sooner it is finished the less moisture is permitted to evaporate, for evaporation increases in intensity, so to speak, as the season advances.

To give an idea of what I mean; last year I had a body of land on which a crop was growing, on one side of a ravine near Alto; upon the other I had a similar body of summer-fallowed land in readiness for the crop now growing upon it. My crop of 1886 was harvested and thrashed quite early in the season. At the first setting of the thrashing machine, I dug two feet into the earth without finding any moisture; at the second, three feet; and at the third, four, with the same results. I then took Mr. Thomas M. May, of Dayton, who harvested my crop for me, across the ravine and showed him that the moisture in the summer-fallow was everywhere within from two to four inches of the surface. Subsequently, I dug down in the land that had been cropped four feet and five inches, at which depth slight evidences of moisture began to manifest themselves, and so continued to five feet, four inches, where the earth cohered when pressed between the fingers, but even there it was by no means so moist as it was between two to four inches in the summer-fallow. The harrowing of the surface of the summer-fallow had acted as a mulch to prevent evaporation and retain the moisture beneath it, in the soil, and it is evident, from this experiment, both that a large part of the annual rainfall can be kept near the surface of the ground for several months, and that its downward percolation or drainage is very slow indeed. The land in question has an average annual rainfall somewhat in excess of that of Dayton.

Now then, it is manifest that if the object be to raise a spring crop, which, according to my observation, does not pay except on the very best land, save in exceptional seasons, it should be put in at the very earliest moment possible in the spring, and if the ground be for summer-fallow, it should be plowed at the same time. The object in the first case being to speedily utilize the moisture that is in the ground in the growth of the crop, and in the second, to store it up so that more than one year's rainfall will go to the growth of the summer-fallowed crop.

I am unable as yet to give accurate tables as to the annual evaporation of the rainfall from the soil of Eastern Washington, but am persuaded that it is much more than in any other place where it has been properly measured. In England, at a point where the mean annual rainfall from 1860 to 1872 was 27 7-10 inches, the mean annual evaporation was a little over 19½ inches, leaving over 6 inches to drain away directly to the streams and thence to the ocean.

The above paragraph does not fully express the idea I wish to convey. Resorting to a table of annual mean evaporation for a period of 10 years, at a point in England, I find the loss of moisture for the following months to be as below:

January	0.95 of an inch.
February	1.01 " " "
March	1.77 " " "
April	2.71 " " "
May	4 11 " " "
June	4.25 " " "

From June to the end of the year the evaporation there, as here, decreases rapidly as the weather becomes cooler and the year draws toward a close.

An examination of the above table will show with what rapidity evaporation increases as the season advances, even in a climate so moist and cool as that of England, and reflection will convince any one that while the ratio of evaporation in Washington Territory may be about the same, the actual amount evaporated from the soil in the spring and summer months will be much greater. Then, again, it is to be remembered that in all the above months, except one or two, the rainfall, in England, very nearly balances the evaporation, while with us it is almost all loss, with a comparatively small amount of gain, so far as rainfall is concerned.

Perhaps the following statement will show clearly the enormous amount of moisture that may be evaporated even early in the year, when the weather is cool:

On the 25th of February, 1887, the streets of Walla Walla were covered with snow, as they had been for some weeks, before which they were muddy. On that day and the next the snow began to disappear from Main street; on the 27th it had wholly gone from the middle of the street, which was dusty; and on the 28th it entirely disappeared and the street was quite dusty. Now on the 28th, as I was assured by Sergeant Blandford, of the Signal Service Office, he placed a small cupful of water on the top of Paine's building; the cup was 1½ inches in diameter by 1½ inches in depth, as we found by measurement; it was in the shade (indeed, the weather was cloudy, I think), but a strong wind, greedy for moisture, was blowing, and in less than 16 hours the entire contents of the cup had evaporated. Was it any wonder that the street was dusty?

CALIFORNIANS

WANT

CALIFORNIA TESTIMONIALS

AND NONE OTHER!

When they pay money for a prescription they demand some assurance of a good result. No prescriber warrants. Our National Disease has been neglected and allowed to run its course, because, heretofore, there has been no guaranteed cure. Years of patient toil and research have brought forth the **Only Absolute Cure for Catarrh, Neuralgia, Nervous Headaches, Catarrhal Deafness, Sore Throat, Inflamed Tonsils, Bronchitis, Granulated Lids, Weakness of the Optic Nerve, Diphtheria** and **Quinsy.** We have proved that the "CARBOLIC SMOKE BALL" and the "DEBELLATOR" will cure, by the numerous Home Testimonials published, and which we will be pleased to send to any address.

THE PEOPLE

ARE DONE WITH EXPERIMENTING!

WORTHY THE SCULPTOR'S CHISEL!

THE WORDS OF PRAISE!

THE LETTERS OF COMMENDATION

Received from those who have Tested the Merits of the

CARBOLIC SMOKE BALL!

WE WARRANT OUR CLAIMS!

(Which are constantly being verified by Home Evidence.)

Catarrh—Cured in from three to six months; warranted.

Asthma—Cured in nearly every case; always quickly relieved.

Bronchitis—Cured in every case; warranted.

Hay Fever—A cure guaranteed when taken in time.

Catarrhal Deafness—Cured in from three to six months.

Eyes—Granulated lids, weakness of the optic nerves, etc., cured within two months.

Neuralgia and Headache—Stopped after the third application.

Diseases of Children — Whooping cough cured; croup relieved in five minutes and cured within two days.

Throat Troubles—Quinsy quickly relieved and thoroughly cured, as are inflamed tonsils and ulcerated sore throat.

Snoring—Three doses each night before retiring cures this trouble.

Colds—In the head, cured by a few applications; fresh colds on the chest, in 12 hours.

THE COMPLETE TREATMENT includes the "Debellator" package, unequaled as a blood purifier, which must be used in Catarrh when there is a dropping of mucus into the throat, biliousness, or where the bowels are irregular or there are stomach or kidney disorders. It should be used in all cases of Catarrh, Asthma, Bronchitis, Hay Fever and Ulcerated Sore Throat. Price of the complete treatment, $5; "Smoke Ball," $3; "Debellator" package, $2. One complete treatment is generally sufficient.

MAIL ORDERS receive careful and prompt attention. State disease or symptoms in writing, addressing MAIN OFFICE. Complete treatment mailed on receipt of price, $5, and four cents in stamps. "Smoke Ball," $3 (four cents in stamps). "Debellator" packages, $2.

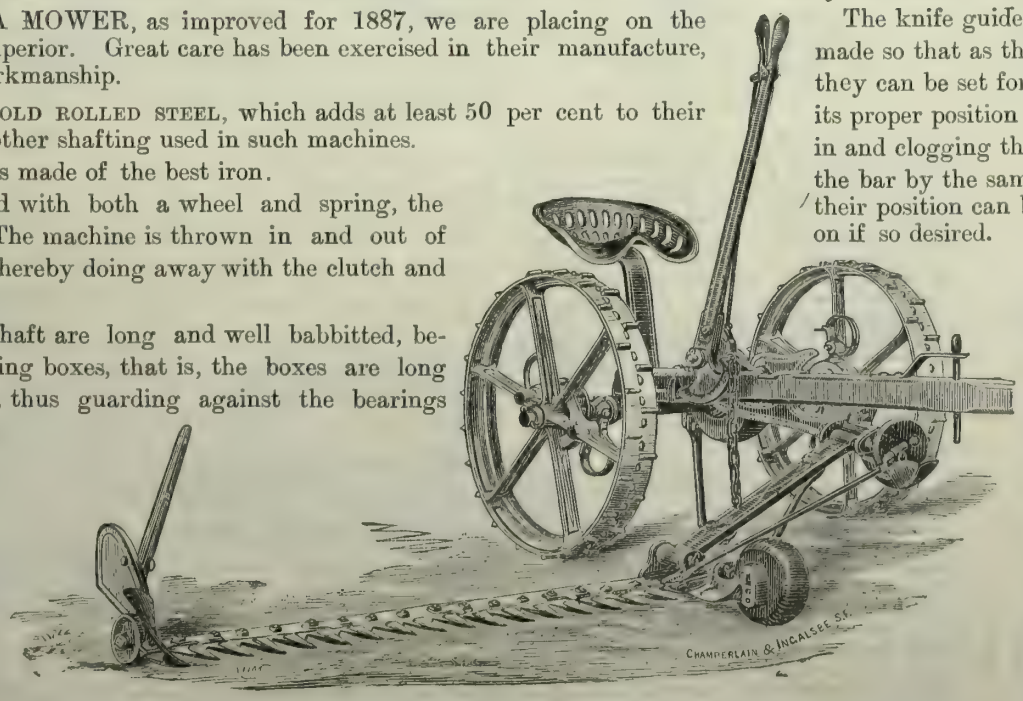
1887

Benicia Improved Mower.

Manufactured by BENICIA AGRICULTURAL WORKS, Benicia, Cal.

In presenting our BENICIA MOWER, as improved for 1887, we are placing on the market a machine that has no superior. Great care has been exercised in their manufacture, both as regards material and workmanship.



The shafts are all made of COLD ROLLED STEEL, which adds at least 50 per cent to their strength as compared with any other shafting used in such machines.

The gearing is incased and is made of the best iron.

The outside shoe is furnished with both a wheel and spring, the spring being wide and heavy. The machine is thrown in and out of gear by means of an eccentric, thereby doing away with the clutch and shifter lever.

The bearings of the crank shaft are long and well babbitted, besides being provided with self-oiling boxes, that is, the boxes are long and filled with wicking or waste, thus guarding against the bearings becoming heated, as the boxes hold considerable oil and continually feed it to the shaft.

The Pitman is long, and is furnished with either straight pin revolving or ball and socket connections, as may be desired.

The knife guides or buttons on the cutter bar are made so that as the back of the knife wears them they can be set forward, thus keeping the knife in its proper position and preventing the grass getting in and clogging the guards. They are bolted to the bar by the same bolts that hold the guards, and their position can be changed or more can be put on if so desired.

The cutter bar can be laid flat across the pole when traveling from place to place.

There are many other points of superiority over other machines, which, on an inspection of the machine, will show for themselves.

In fact we have no hesitancy in guaranteeing the Benicia Mower to be first-class in every particular. It is simple in its construction, of light draft and perfect in its operation.

Weight, 650 pounds. Cuts 4 feet 3 inches. Price, $90.

N. B.—We still have in stock a few CHAMPION MOWERS, which we will offer at greatly reduced prices.

The Late John G. Saxe.

Wide is the regret experienced at the announcement of the death of John Godfrey Saxe, which occurred at his home in Albany, N. Y., March 31st. It is a number of years since he retired from public sight and from the place to which his verse has always entitled him in the leading magazines; but his manly figure is not forgotten, nor have his charming writings grown stale. The keenness of their satire, the geniality of their humor, the truth and purity of their sentiment, will give them long life and always entitle their author to rank among our American poets. His published volumes have been widely distributed; every collection of fireside poems includes a number of them, and his most popular pieces have perennial youth, because of their frequent reappearances in the columns of our newspapers. John G. Saxe has endeared himself to the American heart and appealed irresistingly to our love of sparkle and geniality, and he will not be forgotten.

Mr. Saxe was born in Highgate, Vermont, June 2, 1816, and graduated from Middlebury college in 1839. He was an apt student and was especially noted for his literary scholarship. After leaving college, he first entered the legal profession and achieved more than ordinary success. His love for writing soon led him, however, into the journalistic field, and he published and edited the *Vermont Sentinel* for five years. At this time he wrote his poem, "The Editor's Sanctum," in which he paid his respects to those who thought they ought to have a paper without paying for it, as follows:

Exit the imp of Faust, and enter now
A fierce subscriber with a scowling brow:
"Sir, curse your paper! send the thing to—" well,
The place he names were impolite to tell;
Enough to know; the hero of the press
Cries: "Thomas, change the gentleman's address!
We'll send the paper, if the post will let it,
Where the subscriber will be sure to get it."

Saxe began to write poetry early, but his first work which attracted attention was read before the alumni of Middlebury college in 1846, and was entitled "Progress—A Satire." It is still regarded as one of his best works. His first book of poems was published in 1850 and ran through 17 editions, and afterward, with additions, was put through 32 editions, showing phenomenal popularity. Afterward, up to the year 1875, he published eight volumes, either single poems or collections.

His work was very popular with magazine publishers, and to the *Knickerbocker* he contributed the following, which is one of his most pleasant rhymes:

Rhyme of the Rail.

Singing through the forests,
Rattling over ridges,
Shooting under arches,
Rumbling over bridges,
Whizzing through the mountains,
Buzzing o'er the vale—
Bless me! this is pleasant,
Riding on the Rail!

Men of different "stations"
In the eye of Fame
Here are very quickly
Coming to the same.
High and lowly people,
Birds of every feather,
On a common level
Traveling together!

Gentleman in shorts,
Looming very tall;
Gentleman at large,
Talking very small;
Gentleman in tights,
With a loose-ish mien;
Gentleman in gray,
Looking rather green.

Gentleman quite old,
Asking for the news;
Gentleman in black,
In a fit of blues;
Gentleman in claret,
Sober as a vicar;
Gentleman in tweed,
Dreadfully in liquor!

Stranger on the right,
Looking very sunny,
Obviously reading
Something rather funny.
Now the smiles are thicker,
Wonder what they mean?
Faith he's got the *Knickerbocker Magazine!*

Stranger on the left,
Closing up his peepers;
Now he snores amain,
Like the Seven Sleepers;
At his feet a volume
Gives the explanation,
How the man grew stooped
From "Association!"

Ancient maiden lady
Anxiously remarks,
That there must be peril
'Mong so many sparks!
Roguish-looking fellow,
Turning to the stranger,
Says it's his opinion
She is out of danger!

Woman with her baby,
Sitting vis-a-vis;
Baby keeps a squalling;
Woman looks at me;
Asks about the distance,
Says it's tiresome talking,
Noises of the cars
Are so very shocking!

Market-woman careful
Of the precious casket,
Knowing eggs are eggs,
Tightly holds her basket;
Feeling that a smash,
If it came, would surely
Send her eggs to pot
Rather prematurely!

Singing through the forests,
Rattling over ridges,
Shooting under arches,
Rumbling over bridges,
Whizzing through the mountains,
Buzzing o'er the vale—
Bless me! this is pleasant,
Riding on the Rail!

A recent writer says of him: "Saxe occupies the same position in this country which Tom Hood did in England, and though not possessing the beauty and pathos of Lowell and Holmes, or the tenderness of Longfellow, he is a poet of whom one never tires, and his rank in the poetic scale is none the lower."

Though Saxe wrote much keen satire and much rollicking humor and apt wit, his labors included weightier themes and touch deeper

chords in the popular heart. In his *Miserere Domine* he wrote:

Our Father! ever-blessed name,
To Thee we bring our sin and shame;
Weak though we are, perverse of will,
Thou art our gracious Father still,
Who knowest well how frail we be,
Miserere Domine.

A crushing blow fell upon our poet when at the hight of his fame and prosperity, in the loss of his wife and three daughters by death. He never recovered from the affliction, but has lingered on broken in mind and wasted in frame until the last summons released him from his earthly burdens. His last years were passed in the home of his only son, in Albany, New York, who now of all the poet's immediate family alone lives to cherish his name and fame. His brother, Col. Peter Saxe, of this city, is well known to Californians. To him we are indebted for the original from which the engraving on this page was made, and which represents the poet in his best days.

GRAIN AND GRASS-CUTTERS.—Wm. Deering & Co., proprietors of the great factory of grass and grain-cutting machinery at Chicago, have established a branch office and warehouse in San Francisco, and will in future supply their interior agents direct from their warehouse in this city. Among a large line of mowers manufactured by them, the Giant Mower, cutting five, six, and even seven feet, was successfully introduced at many points in California last year, and is reported to have given the very best satisfaction. M. K. Lauden has charge of their S. F. branch office, and looks after the trade in California, Nevada and Arizona Territory, as well as the northwest coast of Mexico.

Stockton Jottings.

Galloways and Polled Angus.

Mr. H. W. Cowell, of Stockton, lately received a shipment from Leonard Bros., Mo., of 80 head of Galloways and Polled Angus as an addition to his herd, which he purchased from the lot exhibited at the State Fair last season. This lot is mostly heifers, there being but 14 bulls that are old enough for service. Mr. Cowell is well pleased with the prospective results from his herd of Galloways, and believes that they will become the popular cattle on the Pacific Coast. As the Pacific Coast agent for this State for Leonard Bros., he is prepared to furnish Galloways to those who wish to breed them or cross with common stock.

Chance for Settlers.

To meet the demand of the present immigrants who are seeking homes in California, the Stockton Savings and Loan Society has platted 240 acres of land, known as the "Walker tract," lying two miles from Stockton on each side of Mormon slough and between the Old Sonora and Copperopolis roads. This land is of the very best quality and suitable for the culture of all kinds of fruit and vegetables, and particularly adapted to grapes.

This tract is divided into lots containing from 8 to 14 acres, having a street or road running through the tract from north to south and from east to west. It is the policy of the managers to sell to parties who are seeking after homes, and, to carry out this feature, very liberal and easy terms in price and payment are offered by the Stockton Savings and Loan Society.

Gas Well.

Dr. Grattan, of Stockton, in company with a RURAL representative, visited the gas well near Stockton last week. An iron drill weighing 1600 pounds was being forced at a depth of over 2000 feet. From the piping a great volume of water was pouring, the temperature of which might be termed tepid. A lighted taper passing through this great stream of water would ignite the gas in the water and produce a vivid flame of fire that was from 18 to 20 inches in diameter and three feet high. The heat was so intense that it could be distinctly felt six feet away. After this volume of water, or rather the natural gas in the water, had been lighted, it would last from three to five minutes before it would subside. There are now two pipes running from this well to the engine-house, about 20 yards away, that furnish fuel every day the work is going on. Mr. Beam, who is promoting this project, is confident and hopeful that he will succeed in obtaining natural gas in sufficient quantities for domestic use and manufacturing purposes.

A Profitable Investment

Can be made in a postal card, if it is used to send your address on to Hallett & Co., Portland, Maine, who can furnish you work that you can do and live at home, wherever you are located; few there are who cannot earn over $5 per day, and some have made over $50. Capital not required; you are started free. Either sex; all ages. All particulars free.

A GREAT AUCTION.

Extraordinary Offer of the West Coast Land Co.

OVER FIFTY THOUSAND ACRES.

Town Lots in Templeton and Ranch Subdivisions to Come Under the Auctioneer's Hammer.

Notwithstanding the unprecedented success of the West Coast Land Company in the last four months, as evidenced by the sale of over 10,000 acres of farming land, in subdivisions of convenient size for men of moderate means, and the sale of town lots, which has, within the same period, built up the busy and flourishing town of Templeton from absolute nothingness, the owners of the property—which, less the sales of the last four months, embraces 64,000 acres—have decided to offer it all—town lots and farm lots— at public auction on the 14th, 15th, and 16th of April inst. Practically the property will be

SOLD WITHOUT RESERVE,

The only condition being that the bidding shall not be less than 60 per cent of the catalogue price. As the schedule prices range from $10 to $30 an acre, there is really no limitation of the sale in this requirement, as the full price is regarded by every one acquainted with the lands as being exceedingly low. The description of the property in the advertisement which is published in another column shows the quantity in each of the four big ranches in which the West Coast Land Company is interested. It is good farming, fruit and vine land, and requires no irrigation, which will greatly enhance its value in the estimation of all who are familiar with California. The upper Salinas valley, where all the land is situated, is a particularly healthy region, even as compared with other parts of California; there is no malaria and no alkali; no fierce winds and no extremes of heat and cold. The land is fertile, and the railroad has its present terminus at Templeton in the center of the territory offered for public competition.

THE AUCTION ARRANGEMENTS

Have been placed in the hands of the well-known and experienced San Francisco firm of Easton & Eldridge, whose name is a guarantee that everything will be done systematically and honorably. Mr. Easton, who has personally examined the lands, expresses the most unbounded faith in their value and the certainty of a lively competition for their possession. The Southern Pacific Co. has made an extraordinary excursion rate of $6 for the round trip from San Francisco to Templeton and return. The tickets will be good for five days, the train leaving San Francisco at 8:30 A. M. on April 13th and stopping to take on passengers at all the principal way stations. Everything has been arranged for the comfort, convenience and entertainment of 2000 people, and it is highly probable that number will be present. Some

FEATURES OF THE PROGRAM

Are as follows: The excursion train or trains will reach Templeton at 5:30 P. M. on Wednesday, April 13th. A sufficient number of Pullman sleeping cars will be provided to furnish accommodations for those who cannot get entertainment at the hotels. On Thursday morning teams will be furnished free for the excursionists to view all the surrounding country, and a like opportunity will be afforded every day during the continuance of the sale. There will be

A BARBECUE EVERY DAY,

And after the feasting the sale will commence. Bands of music will play at appropriate times and the occasion will be a mammoth picnic such as California has never before witnessed. In view of the great demand for lands in this part of San Luis Obispo county, of the extensive preparations being made, and above all of the rare opportunity to get any sized parcel of fertile land—5, 12, 50, 100 or 1000 acres—at auction, on terms which, after paying one-third, give two, three, four and five years for the purchase money, it seems reasonable to believe that the auction will attract people from all parts of the State, and that the amount of land and lots sold will be enormous.—*Templeton Times.*

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

Artesian Well Machinery.

The excellent results attained by artesian well-boring in various parts of the State, from the extreme south almost to the upper limits of the State, and from the low grounds of the great valleys to the mountain meadows of the Sierra Nevada, warrant us in giving space to an explanation of one of the sets of machinery which is doing good work in this State, and that the outfits furnished by the American Well Works of Aurora, Ill. This establishment issues a pamphlet of 225 pages, describing its well-boring machinery and methods, and as may be imagined, there are hosts of devices for doing different things in connection with well-boring. We select a few illustrations which show the special machinery which has made an excellent record in this State, and especially of late in Sierra county.

The general method of sinking wells is shown in the sectional drawing, Fig. 1. The process to which we refer is known as the revolving hydraulic well sinking process, and the rapidity with which it can be carried on is remarkable. It consists of a machine gripping and turning the well-casing. The lower end of this casing is shod with a steel cutter called a shoe, which is similar to a circular saw. It is made of the best of steel, and it will cut a path for the casing to follow down easily. The upper end has a hydraulic swivel connected with it to which hose is attached. The hose conveys the water down the casing with great force, and going to the bottom passes out between the teeth of the cutter, carrying the dirt or cuttings up, and out with its force, keeping the hole clear so that the pipe has a free and easy rotation. It will be noticed that the water passes down on the inside of the casing and out at the bottom, and comes up on the outside of the casing. The casing forms the wall of the well when completed. This works on the same principle as the diamond drill, which works in harmony with this machine, with the exception of this process, which sinks a well without the drilling tools, the core being left standing in the tube to be worn away by friction, or to be washed out, or when reaching beds of sand. When the core is of clay or a similar composition, on reaching beds of sand, gravel, or cavities in the earth where water will run down into it, the water coming down the casing forces the core down and fills the cavity or percolations in the sand and gravel, stopping it up and making a clayey wall round about the casing, keeps the quicksands from caving on to the casing, and makes a clayey wall in the caving substance in the earth.

In case there is not a sufficient core to make this clayey wall, clay is forced down the tubing, which seeks to pass through the percolations in the earth where water passes, and stops them up. This prevents the quicksand and gravel or other caving material from crowding against the casing and stopping the work. The casing in this process must be kept in constant revolution and a continuous stream of water down the tubing maintained until the well is completed, as it would become fast by the pressure of the loose material against its outer surface. Accordingly the machinery is so arranged that it is not necessary to stop the tubing bring turned or to stop the water being forced down, from the time work is commenced until the desired depth is attained or material met that the steel cutters will not penetrate. In that case, if it is desired and known or expected that such materials will be met, a set of diamonds can be put in that will penetrate everything met in the shape of the hardest boulders or granite.

Fig. 2 shows the derrick and engine ready for operation.

Fig. 3 is an illustration of a heavy, double-pinioned rotary swiveled machine. It will sink a tube from 2 to 15 inches in diameter to a depth of 500 feet with 8-inch pipe; to a depth of 700 feet with 7-inch pipe; 900 feet with 6-inch pipe; 1500 feet with 3-inch pipe, and 300 feet with 12-inch pipe. It will sink a 15-inch pipe 200 feet. It has a power drum or wrench with which the casing is handled when sinking. It is mounted on the upright, immediately above the drilling-drum and is used for handling the weight of pipe and lowering it. It will be seen that in this machine there are two hands represented. The left hand has hold of the lever, and the right hand has hold of a swivel-nutted wrench. The two hands represent the position the man is in when the machine is in operation, only he should be on the right-hand side of the machine instead of the left. With his right hand, as shown, he can tighten or loosen the grip at pleasure, while the pipe is being revolved. With his left hand he reverses the machine. This machine is so constructed that it is driven by two pinions on both sides of its center wheel or revolving turntable. The tackle-block and rope, as illustrated, is to hold the weight of the pipe, and its loose end is around the drilling-drum, which is released by a suitable tension by the brake. The hose is connected to a water swivel, by which water is forced into the casing and passes down and out. The rope that is wound on the spool is used for ordinary lifting, and when revolving down the pipe it is used to lift additional lengths of pipe up into the derrick, together with the second swivel and hose, so as to be in readiness to be quickly connected when it is necessary to add other lengths of tubing.

In Fig. 4 is seen another form of drill, called the "rotary paddy." It expands by pressing down, and makes the hole by being revolved on the boring-rod. Water is forced down the pipe as in the other drill, but of course leaves no core to be taken out.

These appliances are all manufactured by the American Well Works, at Aurora, Ill.

ARTESIAN WELL MACHINERY NOW IN SUCCESSFUL OPERATION IN THIS STATE.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Cheap Money for Farmers.

Farmers in this State will be glad to learn that they can borrow on mortgage any amount, from $5000 to $500,000, from S. D. Hovey, 330 Pine St., San Francisco, at 6 to 7 per cent and taxes. **

The huge, drastic, griping, sickening pills are fast being superseded by Dr. Pierce's "Purgative Pellets." Sold by druggists.

* * * * Young or middle-aged men suffering from nervous debility or other delicate diseases, however induced, speedily and permanently cured. Address, World's Dispensary Medical Association, Buffalo, N. Y.

"The light that lies
In woman's eyes,"

Is a ray of heaven's own brightness; but it is, alas! often dimmed or quenched by some wearing disease, perhaps silently borne, but taking all comfort and enjoyment out of life. That light of the household can be rekindled and made to glow with its natural brightness. Dr. R. V. Pierce's "Favorite Prescription" is a potent specific for most of the chronic weaknesses and diseases peculiar to women.

THE DRAFT HORSES OF FRANCE.—While some people in America call *all* horses imported from France Normans, *it is a fact* that there is no breed in France called by that name by the French people; the name, Norman, therefore, is *purely* American. The principal breeds of France are known as Percherons and Boulanais. The Percherons are the *most highly prized of all* French races, and *all* departments of France go to the Perche for stallions to improve their local breeds. The Percheron stud-book of France, published *under the authority of the French Government*, is the *only* stud-book of draft horses that *is, or ever has been*, published in France, and now contains the pedigrees of over 5000 animals. But some importers are offering certificates from France of Norman draft horses that may mislead people, who do not understand the French language, into believing these records of origin. Not one of them issued contains a pedigree. They are furnished at the request of American buyers by the secretary of one of the French Agricultural societies, who says there is no intention of publishing them in stud-book form, as they have no pedigrees and are of no value whatever. It is a well-known fact that what a man gives for a horse over from $500 to $800—the price of a good grade—is paid for purity of blood; and where the seller is not able to give the recorded pedigree of the animal sold as evidence of additional value, he has no right to ask it. With these facts before him, *no intelligent man* will buy a horse imported from France unless he is recorded with his pedigree in full in the Percheron Stud-Book of France.

SEWING MACHINES.—During 1886 there were made and sold in the United States 817,000 sewing machines. Of these, 647,000 were sold at home and 170,000 abroad. The machines exported brought $2,190,809, and they went to every country on earth.

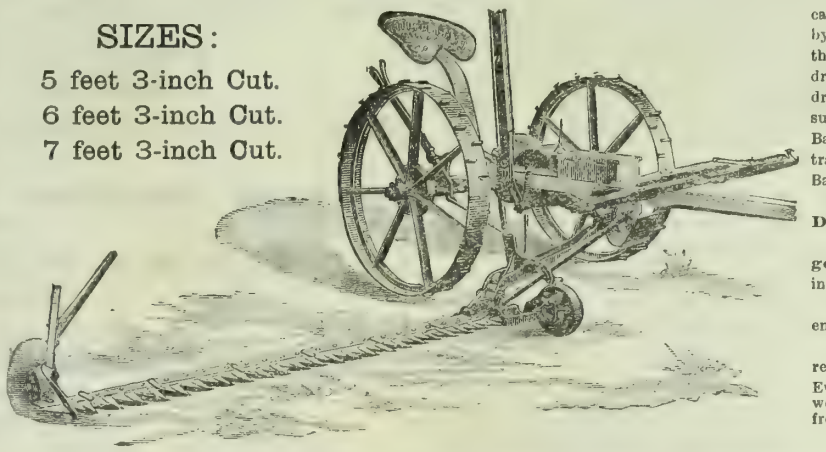
DEERING "GIANT" MOWERS

MANUFACTURED BY

WM. DEERING & CO., CHICAGO, ILL.

Very Strong, Very Economical, Very Light Draft.

THE "GIANT" found no grass in the heavy cutting of last season (1886) which it did not successfully handle; in several instances it was taken into grass that had been given up as being uncutable by other Mowers cutting only 4 feet, at the same time the "GIANT" was cutting a 6-foot Swath.



Intending purchasers of Mowers would consult their own interest by calling upon the local agent and examining into the merits of the "GIANT" before purchasing any other Mower. It is sold under a full guarantee, and intending purchasers are furnished the "GIANT" on Trial.

For doing an immense amount of cutting in a given time, and for leaving the grass in the very best shape for drying, the **Deering Front-Cut Giant Mower** has no equal. With its immense Cutter-Bar of 5 and 6 feet, it is well equipped to do almost **double** the amount of cutting that can be done by the common four-foot Mower, the only thing other factories have to offer to their customers. While the **Giant Mower** can do a giant's work, or about double that of the little Mowers, yet a team of ordinary horses draw it with ease day after day. In short, its draft is little if **any** greater than a common Mower. It is a continual source of wonder to farmers who see the **Giant** for the first time, how a Mower cutting such an **unusual** swath of 6 feet, can be pulled with so much ease by a small span of horses.

The whole secret of the wonderful light draft of the **Giant** Mower lies in the following four facts:

1st, and most important: The Cutter-Bar is supported by a strong **steel** spiral spring, so that the Bar does not rest heavily upon the ground, nor drag with all its heavy weight upon the ground. If it be borne in mind that about 40 per cent of the draft of a common Mower is caused by the dragging of the Cutter-Bar upon the ground, it will be no cause of wonder that the **Giant**, by saving this loss of power, can turn it to cutting almost double the width of swath done by an ordinary Mower. In addition to the economy of power, there are some incidental advantages. It is free from side-draft. There can be no side-draft if the Cutter-Bar does not drag upon the ground. Another advantage had by having a supporting spring, is that the driver is assisted in lifting the Bar by the spring. Still another advantage is the increased traction gained by throwing the weight of the Bar and Drag-Bar upon the wheels.

SIZES:
5 feet 3-inch Cut.
6 feet 3-inch Cut.
7 feet 3-inch Cut.

2nd. The **GIANT** pulls easy, because of its **High Drive Wheels.**

3rd. It pulls easy because of its **large** and perfect-fitting **gears.** In the Giant there is no gear-cutting nor gear-grinding. Every part fits perfectly.

4th. It pulls easy because the shafts are small where they enter their bearings.

We feel a just pride in the **Front-Cut Giant** for the remarkable record it has made since its first introduction. Every farmer who has written us speaks enthusiastically of its wonderful cutting powers, its light draft for two horses, and its freedom from side-draft.

The advantage of course in buying a Giant is **Economy.**

Ask the Deering Agent in your town, or address us for Special Circulars describing our machines in detail, with Illustrations.

CANTATAS FOR FLOWER TIME!

Teachers of Juvenile Singing Classes do not need to be told of the intense interest and enthusiasm which attends the bringing out of a new CANTATA. The following are new, bright, pretty and easily given. Commence in time to prepare them.

VOICES OF NATURE; operetta; N. B. Sargent.

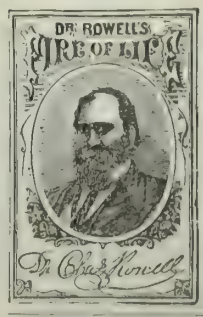
FOREST JUBILEE BAND; N. B Sargent.

NEW FLORA'S FESTIVAL; Bradbury. Arranged by J. C. Johnson.

MERRY COMPANY, or Cadets' Picnic; Collin Coe.

Price of each book, 40 cents, or $3.60 per dozen.

The first two books are by a nature and music-lover, who fills them with very sweet songs of birds, flowers, insects, etc. Flora's Festival, doubled in size, and with minute directions, will surely be a success, as will, in another way, the "MERRY COMPANY."



Our new edition of **VOICES OF PRAISE** (40 cts., or $4.20 per doz.), by Rev. C. L. Hutchins, is cordially commended to all who wish a **Sunday School Song Book** of the highest character.

Schools, Academies and **Seminaries** are always safe in adopting the carefully compiled **School Song Books** of Ditson & Co. We recommend for the higher schools, **SONG GREETING** (60 cents) and **ROYAL SINGER** (60 cents); for grammar schools, **SONG BELLS** (50 cents); and for primary schools, **GEMS FOR LITTLE SINGERS** (30 cents).

☞Any book mailed for retail price.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canals and entitle the owner to one-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

☞For further particulars call on or address

O. J. WOODWARD, FRESNO, CAL. L. SHARPE, SELMA, CAL.

FOR SALE!

A Fresno County RAISIN VINEYARD.

ALFALFA and GENERAL FARM.

800 Acres.

Under a fine state of cultivation and irrigation. Fences, buildings, ditches, levees and checks built in the most substantial manner. Soil unexcelled, as growth of products show. Located near one of the most thriving towns on the S. P. Co.'s Railroad. **Two hundred and twenty-eight acres in vines,** from one to six years old; all have been planted and cultivated by the most experienced vine-growers, and will soon be a prominent Raisin Vineyard of Fresno County. About 200 acres in Alfalfa. The rest of the land is now in grain crops. The farm is well stocked with horses, mules, cattle and hogs. This is a good, substantial interest-paying investment with a great future Will be sold at a very reasonable price, with easy terms of payment if required. For full information and map, apply to

ALBERT E. CRANE.

410 Montgomery Street, San Francisco, Agent for sale of all kinds of Country Property.

Choice Homes in Contra Costa.

Improved Places for Sale near Walnut Creek.

One lot of 11 acres, with house of six rooms, pantry, milk-room and summer kitchen, in good repair; barn, chicken-house, etc., and fine orchard of various fruits. Situated within 1½ miles of the village of Walnut Creek, this offers an almost ideal home to those desiring a sheltered spot in an almost perfect climate. Price, $2000.

Also, 12 acres close by the same village, half set to Zinfandel grape-vines, just coming into bearing, with four-room house—hard-finished and nearly new—stable, etc. Price, $2300. Wells of excellent water on both places.

For further information, address

H. F., Box 2361, S. F.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. **20,000** acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION. 401 California St., San Francisco.

20-ACRE TRACTS.

Fine, rolling, cleared, reddish-brown land, under cultivation in the Shasta Fruit and Raisin Colony. Twenty acres for $500. Terms: $200 cash, and balance in installments to suit purchaser, at 8 per cent per annum. Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

FARMS FOR SALE!

—BY—

GRIFFIN BROTHERS,

Cottonwood, Shasta County, California.

TITLES ALL GOOD OR NO SALE.

We have 40 inches of rain annually, hence need no irrigation and have no law-suits about water rights. Plenty of wood and water. No. 49.

$3000—A well improved 160 acres, 10 miles west of this town on Cottonwood Creek. On public road. New dwelling, only 10 rods to school house; no hills. Forty acres cleared; some good bottom land. U. S. title. Terms cash. Crop goes in.

A FINE RURAL HOME. No. 67.

$25,000.—1035 acres 2 miles from Cottonwood, and fronts on a never-failing stream. About 500 acres of the finest quality of dark, deep, alluvial land that will produce corn, alfalfa, wheat, vegetables or crops of any kind; has yielded 7000 bushels of wheat in one season, besides other crops. The balance of the farm is rolling woods-pasture. On the bottom land are two orchards and vineyard, 3 dwelling houses, large barns and granaries that would cost $5000. Several good wells of water. Splendid location for healthfulness and picturesque scenery. All the farming machinery and household furniture; 19 good horses, including a young stallion; 19 head of cattle, mostly cows; and 40 hogs; also sufficient hay and grain to seed the farm goes in with the farm Part may remain against the farm if purchaser so desires.

No. 68. A SUBURBAN HOME.

$7200.—240 acres on Cottonwood Creek, 2 miles from town; all well fenced and cross-fenced; all good land under cultivation; one half is first-class bottom land; good buildings; terms, half cash.

No. 71.

$3000—800 acres rolling land, finest kind of pasture. Wells can be had for stock water.

No. 70.

$10 per acre—160 acres, perfectly level, gray, second bottom land; 40 acres clear; balance has some brush and oak, but easily cleared. One of the very best locations in Cottonwood valley for Fruits of any kind without irrigation. Terms cash.

No. 73.

Four sections of the best stock pasture land. Rolling hills all covered with grass, on which cattle graze and do well the year round. Plenty of water for stock. This place will be sold very cheap if application is made soon. Title perfect.

No. 74.

$10 per acre.—120 acres good vine land, nearly all cleared, none too rough for work, good house and everlasting spring. U. S. patent. Terms cash.

No. 75.

$10 per acre.—700 east of and on the Sacramento river. All under a good, new wire fence. A never-failing creek crosses the land and furnishes abundance of stock water the year round. About 300 acres level, of which 80 are the finest kind of river bottom land. This bottom land has been under cultivation for several years and produces excellent vegetables.

WEST COAST LAND COMPANY

(A CORPORATION).

Will Sell Without Reserve, Property Described as Follows:

PASO ROBLES RANCH,

Of 20,400 acres, less 6000 acres sold to settlers in the past four months;

THE SANTA YSABEL RANCH,

Of 20,200 acres;

THE EUREKA RANCH,

Of 11,000 acres, and 12,000 acres of the

HUER HUERO RANCH,

All lying in a body, on the S. P. R. R., at its terminus in SAN LUIS OBISPO COUNTY.

AT PUBLIC AUCTION

THURSDAY, FRIDAY and SATURDAY, April 14th, 15th, 16th,

AT 12 O'CLOCK, NOON, EACH DAY.

These are all Agricultural and Fruit Lands, in quality equal to any in the State, with an average annual rainfall exceeding that of Santa Clara County, and require

NO IRRIGATION!

☞Title United States Patent, and to be free and clear of all incumbrances.

TERMS OF SALE.

Lots in Templeton, cash, U. S. Gold Coin. All other tracts one-third cash; balance in 4 equal payments at 2, 3, 4 and 5 years; interest, 6 per cent per annum. The mortgage tax paid by the mortgagee makes the interest about 4 per cent net to the purchaser.

An additional charge will be made of $5 for the deed in sale of town lots, and $15 in other cases for expenses of sale, including making and recording all papers.

Schedule price of ranch subdivisions average $20 an acre; and for 5 to 12-acre lots, $50.

Ten per cent of cash payment (but in no case less than $100) required at fall of hammer; 30 days to complete sale. Parties failing for 30 days, forfeit sum paid.

Parties going from Los Angeles take P. C. S. S. Co.'s Steamers from San Pedro to San Luis Obispo.

The Above Auction Sale is made under the Auspices of the

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

KINDERGARTNERS AT SUTRO HIGHTS.—A very pleasant affair was the visit of S. F. kindergartners to Sutro Hights, last Saturday, in response to an invitation from Adolph Sutro. Over 60 ladies—including officers of the Golden Gate Association and Silver-Street Society, principals and assistants of kindergartens under these organizations, and members of the California Kindergarten Training School—were welcomed by Mr. Sutro, escorted through the beautiful grounds, and made partakers of an elegant luncheon. After the repast, Mrs. Cooper, president of the Golden Gate Association, returned the thanks of the association to Mr. Sutro for the delightful day. Mr. Sutro responding, spoke of the deep interest he felt in the kindergartens, and gave warm encouragement to those engaged in the work. The teachers of the Normal Training Class also expressed their grateful appreciation of his hospitality, and still more of the generous aid that Mr. Sutro had given to the free kindergarten work from the outset.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, promote a useful enterprise, and, at the same time, earn a good, honest living. Send name, age, business experience, and good references. Apply to Dewey & Co., 220 Market St., S. F.

P. S. Readers of this notice can help our common cause by informing persons, likely to become good agents, of this chance.

CALIFORNIA POULTRY ASSOCIATION.—Pursuant to the call for their regular annual meeting, Secretary Marsh, and Messrs. Cousens, Everett, Keesling, Lund, McBirney, McFarling and Newhall, of the California Poultry Association, gathered at 40 California street, San Francisco, on Wednesday of this week. Wanting a quorum, the members present held an hour's informal converse, and then adjourned to meet again, at the same place, on Wednesday, May 4th, at 11 o'clock, when it is hoped that there will be a full attendance.

CHANGE IN ADDRESS.—We call the attention of our readers to the change in address of O. J. Albee, the well-known poultry dealer of Santa Clara county, to Lawrence, a new postoffice recently established near Mr. Albee's place.

To Every Pump Maker,

Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION concerning ANY APPLICATION or any ADJUSTMENT of ANY KIND of a PUMP which is not answered in MR. ROBERT GRIMSHAW'S PUMP CATECHISM,* we would like to have it for answer in the next edition or volume.

The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if the have a practical bearing.

*Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only $1, and worth $5.

DEWEY & CO.,
220 Market St., S. F.

NEW IMPORTATION

—OF—

NORMAN STALLIONS.

Theodore Skillman has just arrived from France with the choicest importation of Norman Stallions that has ever reached the Pacific Coast. Mr. Skillman has selected these horses from the best in France, with a view to the improvement of draft horses on this Coast. They are young and sure to suit the tastes of intending purchasers as regards color, etc., a number being coal-black. He has also on hand some Imported French Coach Stallions. These horses are now very popular in the East and have long been the favorite carriage horses of France. Their merits speak for themselves. Come and inspect this rare collection of horses and be convinced that they are the best ever seen on this Coast.

☞Catalogue for 1887 sent free on application.

THEODORE SKILLMAN,
Petaluma, Cal.

HOLLISTER CALA.

BANDMANN, NIELSEN & CO, General Agents, San Francisco.

Best & Driver's
IMPROVED COMBINED HARVESTER
For 1887.

—MANUFACTURED BY—

DANIEL BEST, San Leandro, Cal.

Standard size, 14-foot cut. Cylinder, 30-inch. Separator, 41-inch. Belt and Geared. Will make any size ordered.

These machines are made of the best material. Frame of Separator is made of hard wood and all timber used in their construction is thoroughly kiln dried.

HAS STEEL SHAFTING AND GEARING.

The Gearing is composed mostly of Spur Wheels, and so compactly arranged that should the frame of the machine weave because of the unevenness of the ground, there would be no danger of the gearing getting out of line, causing it to cut or bind in the boxes, which occurs with other Harvesters in which the gearing is more scattered.

We have succeeded in getting that combination of Lightness, Adaptability and Strength which is the result of thought and skill, taking from some parts and adding to others, making our Harvester from four to six horses lighter draft, and yet retaining as great strength as the heavest machine manufactured. The Header is very rigid and so balanced and hinged that it is no trouble to save down and tangled grain. A boy ten years of age can manage it.

I wish to call your attention particularly to the separating qualities of my Harvester. The agitators are so arranged that the grain is completely shaken from the straw, and my new AUTOMATIC GOVERNOR on the fan completely governs the blast on the shoe, so that at any speed which the machine travels, the blast will be the same, making a saving of a great amount of grain that would otherwise be blown over the riddles; but, instead, will go into the sack, which in a season will more than pay the harvesting expenses, over and above any **Combined Harvester** that has not the **Automatic Governor.**

Each **Harvester** has one of my celebrated **Grain Cleaners** attached, which needs no recommendation from me, as the grain growers of California can testify as to its merits and superiority over other Cleaners on the Coast.

Every machine is thoroughly tested before it is allowed to leave the factory, so there will be no trouble or vexatious delays in the field.

They cut, thrash clean, and sack grain for less than $1 an acre, against $3.50 an acre the old way of heading and thrashing. They require three to four men and fourteen horses for a 14-foot cut, and an additional horse for every additional foot cut.

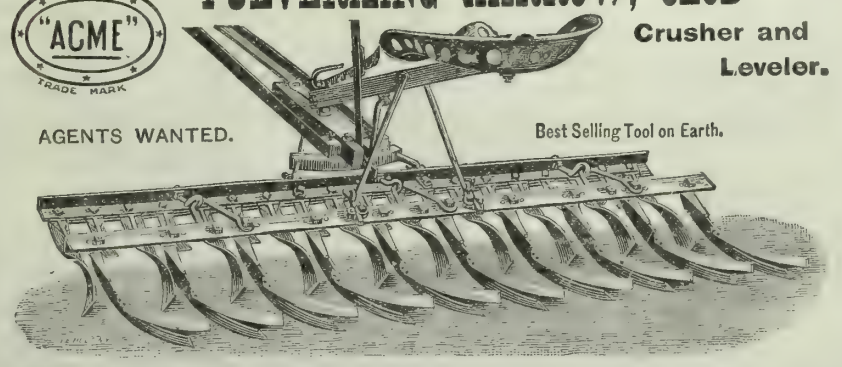
Please call at my Works, near the Depot, San Leandro, and examine our Harvester. I have sample machine belted and attached to the power of the factory, and will take pleasure in showing how it works, so that you can become familiar with the working of the machine before taking it into the field.

I also desire to call your attention to my latest Improved Cleaners that I make for any and al Combined Harvesters. The great success I have had with my Cleaners, made to run with Thrashing Machines, as well as the satisfaction given by my Fanning Mill and Warehouse Mill, induced me to design and build a Cleaner, especially for the Combined Harvesters. I make the following sizes, viz.:

45-inch for 18-foot cut and over.
40-inch for 14 to 18-foot cut.

This Cleaner is the most successful Combined Harvester Cleaner ever offered to the public, and I can guarantee it to be the most perfect Cleaner now in use. I have made a great many valuable improvements that have never yet been introduced, the merits of which will be quickly understood and highly appreciated by those who have use for the Cleaner. It is made strong and durable, and of such size and capacity that it will easily handle and thoroughly clean the grain as fast as any Combined Harvester will thrash it, and it has proven to be the only Cleaner, mounted on Harvesters, that will thoroughly clean foul grain and make it merchantable.

Write for Circulars. For further information, prices, etc., address



DANIEL BEST, San Leandro, Alameda Co., Cal.

PULVERIZING HARROW, CLOD Crusher and Leveler.

"ACME" TRADE MARK

AGENTS WANTED.

Best Selling Tool on Earth.

Subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of Double Gangs of Cast Steel Coulters—immense cutting power. Crushing, Leveling and Pulverizing performed at the same time. Entire absence of Spikes or Spring Teeth avoids pulling up rubbish. The only Harrow that cuts over the entire surface of the ground.

We make a variety of sizes from 3 to 15 feet wide.

The **"ACME"** is in practical use in nearly every Agricultural County on the Pacific Coast, and has proved itself to be just the tool for

VINEYARDS, ORCHARDS AND GRAIN FIELDS.

S. F. Market Report

NOTE. Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, April 6, 1887.

The past week witnessed continued activity in cereals at hardening prices, the absence of rains contributing no little to influence prices. The warmer weather put garden stuff well along, causing many seasonable varieties to mature rapidly. The same remarks apply to small fruits. The European wheat market has ruled weak, but to-day is steadier as reported by private cables. Semi-public cables are as follows:

LONDON, April 6.—Cargoes off coast, nothing offering. Cargoes on passage and for shipment, buyers hold off, hoping to obtain some concessions. Cal. wheat off coast, 39s. Cal. wheat just shipped, 37s 9d. French country market, firm. Liverpool wheat, spot, weaker. Liverpool wheat, Cal, 7s 6d@7s 9d.

Foreign Review.

LONDON, April 4.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: English wheat is tending lower in London, and in a number of provincial markets there has been 6d to 1s decline. The feeling of the trade is one of extreme depression. Sales of English wheat during the past week were 53,689 quarters at 33s 3d, against 61,240 quarters at 30s 5d during the corresponding week of last year. The market for foreign wheat is quite demoralized. The available supplies are already more than ample for the remainder of the cereal year, while stocks at ports are constantly increasing. The week's receipts of flour at London are the largest on record for a single week, amounting to 88,037 sacks of American and 15,596 sacks of English. Four cargoes of wheat arrived; 3 were withdrawn and 1 was sold. To-day trade was at a standstill. Quotations were nominal and the dealings that were made were at 6d decline. Flour was depressed. Quotations were irregularly lower. Corn was quiet. Russian oats rose 6d. Linseed was 5d higher.

Eastern Wheat Markets.

NEW YORK, April 3.—The wheat market has been stronger on favorable reports regarding the crop prospects of California, as well as several Western States. These, together with the liberal export movement, gave a firmer tone to the views of holders. Spot closed ⅛@1c higher, and futures ⅛@¼c higher for the week, as follows: April, 91¼; May, 91⅝; June, 91¼; July, 90½; August, 89⅝; and September 90¼c.

NEW YORK, April 6 –12 M.—92½@93c for cash, 91c for April, 91¾c for May, 91⅝c for June, 90½@90¾c for July and 89⅜@90c for August.

CHICAGO, April 6—12 M.—77⅜c for cash, 79⅝c for April, 82⅞@83c for May, 81⅜c for June, 80½c for July and 79⅝c for August.

Eastern Wool Markets.

NEW YORK, April 3.—Business last week was dull. Manufacturers do not operate beyond their urgent wants. Holders desire to sell but do not propose to give way in prices. The sales of the week include 258 bags scoured California at 52½c; 5000 lbs scoured pulled at 54c; 3000 lbs Territory at 20c; 20,000 lbs Montana at 21c; and 10,000 lbs Montana, 100,000 lbs Eastern Oregon and 2000 lbs scoured Territory on private terms.

Philadelphia—The market is dull, with little desirable wool on sale, except Territorial and fine fleeces. Buyers' views are about 1 cent under those of holders, and sales slow. Among the sales were 80,000 lbs California defective Fall at 14c; 1000 lbs Territory medium at 23c; 3000 lbs unwashed coarse black Territory at 12c; 10,000 lbs same command 22c; 25,000 fine Territory on private terms.

Boston—The market records lower prices, but dealers are looking for better prices on spot wool, because of the increased cost of bringing wool across the continent under the Interstate Commerce law. Among the sales were 210,500 lbs Territory at 17@25c; 115,000 lbs California Fall at 16@17c; and 33,000 lbs California Spring and Oregon on private terms.

BOSTON, April 4.—The wool trade for the past week continued quiet. The sales have been 1,627,100 pounds. This shows the manufacturers are as backward as ever, and that the present weak prices at which desirable wools are offered are not proving as great an inducement for them to take hold as might be supposed. The position of wool does not warrant an advance at this time, with large supplies of new wool near at hand, and the stocks of many grades in large supply on the seaboard. The only feature of prominence in the market is the unsettled feeling caused by an advance in freights. California wool will cost, laid down, 5c per lb more than at present, when the new rates go into effect. The product of other States will also cost higher in proportion. The only exception at present seems to be Texas wool, which will be benefited rather than hurt by the advance. At other points there is great uncertainty everywhere in regard to this matter, and it is difficult to determine what the outcome will be. California wool is very dull, with sales of 1500 lbs Fall at 16@17½c; and 8000 lbs Spring on private terms. In Western unwashed and unmerchantable fleeces there have been sales of 20,000 lbs fine and medium at 19@20c; 2000 pounds medium at 25½c; 15,000 lbs medium at 23c, and 9000 lbs on private terms. Sales include 25,000 lbs at 35 to 60c; 14,000 lbs at 45@58c; and 99,700 lbs on private terms.

New York Hop Market.

NEW YORK, April 3.—There is not the slightest change in the appearance of the market. Few goods are being sold, and those few go at rather low prices. Pacific Coast crop 1886, best, 20@22c; do common to good, 16@19c; do 1885, good to prime, 8@10c.

California Products at New York.

NEW YORK, April 3.—Seeds—Considerable interest has developed for California yellow mustard, resulting in sales of about 2000 bags at 3¾@4c. At the close 4c was freely bid, but holders have advanced their views to 4¼@4½c. This movement has been influenced by the advance in freight rates.

Dried Fruit and Canned Goods East.

NEW YORK, April 3.—Canned Goods—The market is rather quiet, though there is more doing in corn and peas. Tomatoes are slow, though steady in price. The stock of peaches in Baltimore is now estimated at between 13,000 and 15,000 cases. California canned peaches, $2.50@2.75; pears, $2.50@3.25; plums, $1.85; grapes, $2; apricots, $2.10.

Dried Fruit—For raisins, the demand shows a moderate increase, and the tone of the general market is better. Two-crown loose Muscatel quoted at $1.20@1.30; London Layers, $1.50@1.55; California Londons, $1.50@1.80; do two-crown loose, $1.25. Prunes—Turkish has had a fair jobbing demand at 4⅝c. Citron, quiet at 17@17¼c.

Crops at the East.

CHICAGO, April 3.—The *Farmers' Review* for this week says: Reports from the winter wheat-growing States are still of favorable tenor. The majority of the returns indicate that the fall-sown grain is in full average condition. The weather continues dry in Missouri and Kansas, and there is a great lack of moisture, particularly in the last-named State, but as yet the crop has not been seriously injured on this account over any widely distributed area. In Michigan and Wisconsin large portions of the State are still under snow.

California Fruit in Chicago.

CHICAGO, April 2.—Oranges are meeting with a very fair demand. Fruit of choice quality is firm. California Bright Riverside, $3@3.50; Santa Ana, $3@3.50; Los Angeles, $2.75@3.25; Navel, according to quality, $5@6; Duarte, $3@3.50; San Gabriel, $2.75@3; Blood, fancy, $5@7.

Dried fruit is rather quiet and dull. The outside trade is reported quiet and the demand from jobbers and the usual buyers is in consequence small. Most all kinds of fruit are in limited supply in the general range. California dried fruits were quoted steady, and former prices are obtainable, but the supply has been reduced until it is now quite small. Prunes, French, per lb, 8@9½c; plums, pitted, 10@11c; peaches, halves, 11@12½c; do halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London Layers, 20-lb boxes, per box, $1.40@1.50; loose Muscatel, per box, $1.20@1.30; California Layers, per box, $1.25@1.35.

London Wool Market.

LONDON, April 4.—At the wool sales to-day the attendance and bidding were good. Full prices were generally obtained.

Local Markets.

BAGS—The market is very weak, with sellers anxious. Sales of large parcels are reported to have been made as low as 5½@5¾c for standard Calcuttas. They job at 5¾@6c for June-July delivery.

BARLEY—The strong advancing market reported in last week's issue continued the past week with a higher range reached. The demand for consumption is quite large. On Call, prices have been gradually creeping. The following are to-day's sales:

Morning Session: Buyer season—100 tons, $1.09½; 400, $1.09¾; 600, $1.09½; 600, $1.09; 100, $1.08¾; 400, $1.08¼. Seller 1887—400 tons, $1.02; 300, $1.02½; 100, $1.02¾; 100, $1.02½ ₩ ctl.

BUTTER—A steadier tone manifests itself. Considerable has been packed so as to fill distant orders. The demand is improving. Dairymen are reported to be packing.

CHEESE—The market is steadier, with apparently the bottom having been reached. The demand is quite large for the season.

EGGS—The market is stronger but no higher, owing to the heavy supply of Eastern. The stock of Eastern here is 100,000 dozen, and to arrive 300,000 dozen. As higher freights went into effect last Tuesday, no further shipments need be looked for at present. The freight from the East is now six cents per dozen.

FLOUR—The market is very strong at another advance.

WHEAT—The market is strong, with further advances established. As high as $1.70 was bid for No. 1 by a shipper to day. The market appears to be well in hand. On Call, transactions continue free, with a large short interest reported. Sales to-day are as follows:

Morning Session: Spot season's storage paid—200 tons, $1.75. Buyer season—200 tons, $1.80½; 200, $1.81½; 300, $1.82; 100, $1.82½; 100, $1.82¼; 100, $1.82⅜; 1000, $1.82½; 100, $1.82¾; 100, $1.82⅞; 200, $1.83. Buyer 1887—200 tons, $1 92½; 1700, $1.93. May—100 tons, $1.79½; 100, $1.79⅝; 200, $1.79. July—100 tons, $1.78¾. Seller 1887—3900 tons, $1.70; 100, $1.70⅛; 100, $1.70¼; 100, $1.70⅜; 1500, $1.70½; 100, $1.70⅝ ₩ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

The local wheat market has held to strong prices throughout the week. The strength of the market is due to continued dry weather and the stock of available wheat well in hand. The dry weather creates considerable uneasiness. On lowlands, summer-fallow land, and irrigated land, crops are looking well, but on late sown land they are looking bad. While it is hardly likely that the latter can be greatly benefited, except in favored districts, by rains, the rest would be made to yield a good average crop. The stock of wheat in the State is variously estimated, but it is safe to say that it does not exceed 200,000 short tons. The bulk is held against short sales on Call.

Advices from Washington Territory and Oregon are favorable to the wheat crops, but still rains are wanted in several large agricultural sections.

Eastern advices report the visible supply of wheat being rapidly reduced by both the local and export demand. Crop advices taken as a whole are favorable.

European crop advices are said to be more favorable in England, France, and Germany than at this time last year. As the stock held is below an average, with the outlook favorable to a less carryover than usual, it is not at all likely that an increased crop yield will be materially felt.

It is reported that a leading miller has on the way from Kansas 200 carloads of wheat. If this is true, the quality of the brand is not likely to be improved, as Western wheat is not as good as Californian.

The demand for barley is reported active, chiefly for consumption. The high price ruling for oats, together with poorer pasturage, have caused a freer feeding of barley. The number of horses used in railroad building has largely increased. Advices from the large barley districts, while not unfavorable to the growing crop, still show that rains are sadly wanted, and if held off too long, no doubt many fields will be ruined.

Oats are scarce and high, with holders offering sparingly under the impression that a still higher range of values is not at all unlikely at an early day.

Both rye and buckwheat are dull but steady.

Corn is stronger, with a better demand ruling. The higher freight rates from the East are favorable to holders. The stock in this city and to arrive is light.

Feedstuffs.

Ground barley is strong at an advance. Bran, middlings, and feedmeal are very firm. The demand for all kinds appears to be free for the season, due to the poor pasturage.

Hay is higher, with a strong tone at the close. The demand has increased quite largely, and as holders offer more sparingly stocks keep well cleaned up. Choice grades of hay find ready customers at from $14@14.50 per ton.

Fruits.

The shipments of oranges to Eastern points were up to Monday night larger than ever before known, owing to the higher freights going into effect on Tuesday. Receipts in this city continue quite liberal, but the market for good to choice is well cleaned up under a large local and shipping demand. Poor oranges are slow of sale.

Limes and lemons are steady at full quotations. The former are, as a rule, of poor quality, but all choice, good sound keepers are wanted on orders from the Northern coast.

Eastern apples continue in liberal stock, with the poorer qualities moving slowly, even at $3@4.50 per bbl. The more choice meet with a fair trade call.

All advices concur in stating that present prospects of the incoming fruit crop of this State are better than ever before known.

So as to take advantage of the low freights to the East, the market was well cleaned up of dried fruits before Saturday night. The local trade is quiet, but dealers are not pressing sales, believing that prices are likely to go slightly higher.

Heavy shipments of raisins to the East have left the market well in hand, causing a stronger tone to obtain.

The first strawberries of the season were received on last Saturday, and sold at 50 cts per basket.

Live-Stock.

Choice bullocks continue scarce and fetch high prices, notwithstanding the decreased consumption. Slim beeves are weak and placed more slowly, owing to the free offerings on the market. Mutton sheep are easy but no lower, with none expected. Hogs continue strong under light receipts. Lambs are steady, as are calves. Milch cows are in fair request at unchanged prices. In work-horses some trading was done, owing to the demand for drays and trucks to move railroad freight. General utility horses are wanted. Matched horses, good steppers, and generally good appearance are wanted, and fetch quite readily from $500 to $1000 per pair.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 9½@10c; first grade, grass fed, 9@9½c per lb.; second grade, 8@8½c; third grade, 6½@7½c.

MUTTON—Ewes, 6¾@7c; wethers, 7½@8c.

LAMB—Spring, 12½@15c.

VEAL—Large, 6@8½c; small, 5@8c.

PORK—Live hogs, 4¾@5¾c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5¾c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

New potatoes are increasing slowly, but as yet they do not cut any figure in the market. Old potatoes are very strong, with the better qualities in good demand. Stocks are light, as are receipts.

Onions continue to advance under a growing scarcity and a fair demand for the more choice.

Receipts of asparagus have increased quite rapidly, causing a lower range of values. Indeed this can be said of all kinds of seasonable vegetables. The hot, forcing weather has caused them to mature quite rapidly. Prices, as usual, vary from day to day, according to the receipts. Winter cabbage is more quiet, but prices are maintained.

Wool.

For all of two weeks up to April 5, shipments of wool to the East were very heavy. All the old stock was worked off, as were all the receipts of this year's clip. The large shipments were made to take advantage of the low freights before the advance in rates. The market at this writing is unsettled and without life, owing to buyers not being well informed on the new freight tariff and its effects at the East. All quotations consequently are more or less nominal.

Miscellaneous.

Poultry has held to strong prices throughout the week, with choice of all kinds sold above top quotations. Receipts are light and demand good.

Beans are strong, but quiet. Stocks are light, owing to the heavy shipments to the East.

Hops are dull, but the stock is light, barely sufficient to meet the home demand. The shipments to the East last week were unusually large.

Broomcorn is more inquired after, but prices are unchanged.

Mustard is stronger, as the crop prospects are poor. Other seeds are weak.

Tallow is in good request, with the supply lighter.

Hides are weaker, with buyers bidding down.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	207,564	217,022
In port, disengaged	102,398	39,284
In port, engaged	18,055	42,636
Totals	327,917	298,942

The above gives a carrying capacity as follows: 1887, 524,667 short tons; 1886, 478,300 short tons; increase over last year, 46,360.

San Francisco, April 6, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

ARCTIC OIL WORKS,

Manufacturers of

INSECTICIDE!

FOR ERADICATING AND DESTROYING ALL PESTS THAT INFEST FRUIT TREES AND PLANTS, SUCH AS

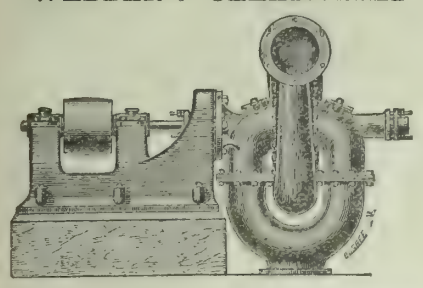
SCALE BUG, HARVEST FLIES, TREE HOPPERS, PLANT LICE, Etc.

It has been fully tested by the Agricultural Department of the State University, and pronounced a success, the endorsement of which we append. It is put up in convenient forms for use both in liquid and paste state.

For Sale in Barrels and 2 and 5-pound Cans in paste form, and in Barrels and 5-gallon Cans in liquid form.

Copy of Letter Received from the University of California, College of Agriculture, Berkeley, dated December 4, 1886.

J. N. KNOWLES, Esq., Manager Arctic Oil Works, San Francisco—Dear Sir: We have lately tested the Insecticide preparation of Whale-Oil Soap sent by you to us, and have found it to be very effectual against the Scale infesting Orange and Bay Trees here; also against the Thrips. From our previous experience with a similar composition, I think it will be found fully effectual against any small Insect Pests not specially protected like some of the armored Scales, and against which any Wash short of strong lye cannot be used. Respectfully,



E. W. HILGARD, Professor of State University.

In the UNITED STATES,

Consisting of Wood and Iron Working Machinery. Pumps of every description.

ENGINES AND BOILERS

A SPECIALTY.

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

THOMAS D. POOLE,

1867 Encinal Ave., Alameda, Cal.

LIGHTNING WELL SINKING MACHINERY. Our Artesian Well Encyclopedia contains near 700 engravings, illustrating and describing all the practical tools and appliances used in the art of well sinking; diamond prospecting machinery, windmills, artesian engines, pumps, etc. Edited by the "American Well Works," the largest manufacturers in the world of this class of machinery. We will send this book to any party on receipt of 25 cents for mailing. Expert well drillers and agents wanted. Address, **The American Well Works, Aurora, Ills., U. S. A.**

HAWLEY BROS. HARDWARE CO.

—AGENTS FOR—

Adriance, Platt & Co.'s "BUCKEYE" MOWERS, the only Genuine

"BUCKEYES."

Adriance "Buckeye" Mower at work.

The preference which has been shown for the harvesting machinery of ADRIANCE, PLATT & CO. by so many thousands of farmers in all parts of the world has nowhere been more decided than on the PACIFIC COAST, where their "Buckeye" Mowers and Reapers have so many years been recognized as STANDARDS OF EXCELLENCE IN PRINCIPLE, MECHANISM AND WORKMANSHIP.

The above firm has been manufacturing the original "BUCKEYE" machines for more than 25 years, during which time we have been their agents in California, and there have been in the meantime about 24,000 of their machines sold here, all having given the best satisfaction. We could cite no better evidence of their superiority and popularity than the above statement. Don't experiment by buying unknown and inferior machines.

THE TAYLOR SULKY RAKE.

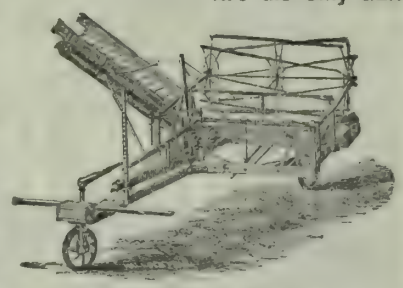
THIS MONARCH OF BOTH

HAND AND SELF-DUMPING Rakes

Has been much improved, and is the best rake in the market, working directly upon the axle by means of a simple clutch in the wheel, does away with that breaking and wearing out of small pawls and ratchets, and winding up of grass in cogs and other gear on outside of hub. Anybody who can drive a horse can operate it successfully.

BUY THE "TAYLOR."

PERKINS' WINDMILL.



EVERY MILL WARRANTED.

The Genuine Perkins' Windmill has earned a reputation for excellence that will be maintained. It is unquestionably the most perfect and beautiful Windmill in the market.

These Mills are reliable and always give satisfaction. Simple, strong, and durable in all parts. Solid wrought iron crank shaft with double bearings for the crank to work in, all turned and run in adjustable babbitted boxes. These Mills are perfectly noiseless, easy and graceful in all their movements. Positively Self-Regulating, with no coil springs or spring of any kind, no little rods, joints, levers, or balls to get out of order, as such things do. Mills in use six to twelve years in good order now, that have never cost one cent for repairs.

HODGES' HAINES' HEADERS

Are the Only GENUINE HAINES' HEADERS.

Hodges' Haines' Headers.

They are the best improved and most practicable Headers in the market. Many important improvements have been added, which must be examined that their great value may be appreciated.

All of our Hodges' Single-Gear Headers have Self-Adjustable Reels, Patent Beveled Finger Bars, Extra High Patent Iron Wheels, Center Pitmans, Patent Tongue Irons, Improved Belt Tighteners, Balance Springs on Levers, Loose Gear Spur Wheels, Wood Frame Steering Post, and Grooved Steering Wheels. The above-named improvements can be obtained only on Headers made by A. J. HODGES & CO., and sold only by us. We ask you to compare them with other kinds in the market before purchasing.

DO NOT FAIL TO SEE THEM BEFORE YOU BUY.

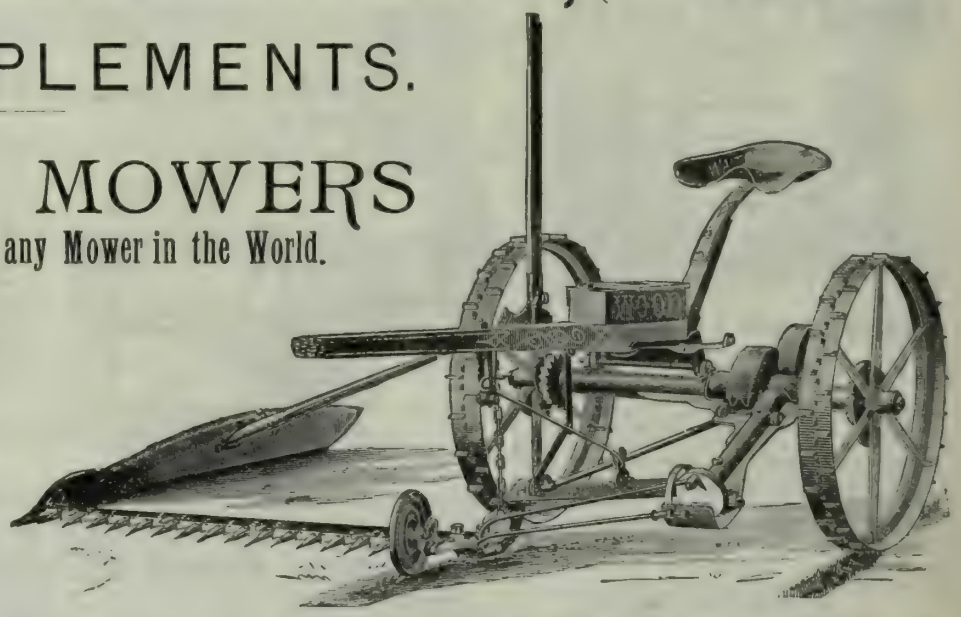
DEALERS IN

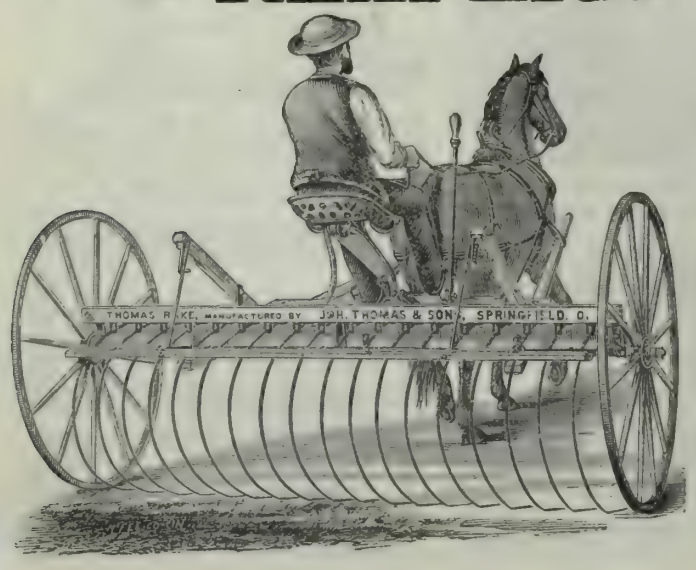
AGRICULTURAL IMPLEMENTS.

—GENERAL AGENTS—



WALTER A. WOOD MOWERS

The Lightest Draft and Most Comfortable to Ride of any Mower in the World.



With its unequalled underdraft device the horses pull on the bar direct and there is no slipping of wheels. The draft action on the WOOD is the only one ever devised that accommodates itself with exactness to the varying character of the grass and the ground. It eases the bar automatically in proportion to the pull by the team and resistance of the work, without causing neck weight or side draft.

ENCASED GEARING, PROTECTED PITMAN, LOCK NUTS.

Its Perfected Shifter is without wear and starts the knife instantaneously when the wheels move. Has Wider Tread and Higher Wheels than other Mowers, making it light draft and easy running.

The Walter A. Wood Twine-Binders AND REAPERS.

THE THOMAS RAKE, THE ROYAL SELF-DUMP RAKE, and THE COATES LOCK-LEVER RAKE, all Good and Hard to Equal.

The Thomas is the Best Hand-Dump Rake.

Because it is the easiest-dumping rake made.

Because a long brass spring is over each tooth, causing them to adjust themselves to the ground, consequently there is less scratching and breakage.

Because its overhanging cleaner, with rollers to prevent friction, turns the hay in dumping, brings the green hay on top, leaving it a loose windrow in good condition for drying.

Because it makes the largest windrows. Teeth are shaped specially for taking up hay and leaving dirt and trash.

Because nearly all iron used is either malleable or wrought, every part is strong and durable. Because it is comfortable and convenient to the operator. Some rakes are man-killers as well as horse-killers.

Because best adapted for all kinds of work and ground.

Because always in order, ready for work.

If you want the most perfect and complete rake made, buy the Thomas.

The Royal Self-Dump Rake.

Any boy or girl able to drive a horse, can use this rake, as the horse does all the hard work.

It has a solid and continuous steel axle from wheel to wheel.

The dumping cog-wheel is placed in the center of the rake and inclosed in an iron boxing, thus preventing the lines and hay from winding in it (common faults of other rakes), and either breaking or preventing dumping.

Both ground-wheels are attached to the revolving steel axle, and a slight pressure by the heel or foot dumps the rake instantly.

This rake has on it what is known as the "stationary hand-lever," which remains stationary, while the teeth are being raised, thus preventing the hand-lever striking the driver, as it is apt to do in other self-dump rakes.

Each Coates Lock-Lever Rake

Has an ingenious contrived joint, which holds the Rake firmly to its work, while down, **without using the hands or feet.** It is one of the most powerful LEVERS known in mechanics.

THE TEETH are made of **refined cast steel, tempered in oil,** and every one tested. They readily adjust themselves to uneven surfaces, and will not become weak or bent out of line. **Every tooth is warranted.**

THE REGULATING of the Rake for any kind of ground is done easily by changing a pin at the joint, which raises or lowers the teeth as desired.

Twenty Acres per Day

Is a fair day's work with the Coates, and you can save enough grain from 25 acres of stubble to pay for the rake.

Particular care is taken to use only the **best timber, iron and steel,** to build them in the **strongest manner possible.** The Shafts and Rake-Head are **extra strong;** Thimble-Skein Axles; Wheels very high and well built and finished; Seats easy and thoroughly braced.

PACIFIC RURAL PRESS

TWENTY PAGE EDITION.

Vol. XXXIII.—No. 16.] SAN FRANCISCO, SATURDAY, APRIL 16, 1887. { $3 a Year, in Advance / Single Copies, 10 Cts.

Land Legislation.

The Congressional Act restricting the ownership of real estate in the Territories to American citizens, of which a full copy may be found on page 335, has been hailed with general favor. It is the culmination of a feeling that has been silently growing for a dozen years or more. The report of a Congressional committee that about 20,000,000 acres of land are already in possession of aliens; that one-eighth of Texas and one-sixth of Colorado belong to persons who owe no allegiance to this Government and do not even intend to become citizens of the United States, was startling. Legislation became inevitable. Land monopoly is bad enough, but a foreign land monopoly is simply intolerable.

A London cablegram states that the provisions of the Alien Land Act have created a great flurry in the financial circles of that metropolis; that a large number of American land schemes had been knocked in the head by it; that it arrived while Mr. Dorsey was negotiating with a London syndicate to purchase a tract of several million acres in New Mexico, and Rufus Hatch was trying to unload a big ranch in the same market. Both of these great operators found themselves suddenly left high and dry upon a rock surrounded by the wrecks of a fortune they had nearly anchored in port. The panic has also seized the loan companies and money sharps, as it is uncertain how far this Act may affect their interests in American mining property. The Mines Company of Gresham House, the largest concern of the kind in Europe, has passed a resolution refusing to deal any more in American mines, lands and securities in the Territories. Should a way be found to evade the law, it is not likely they will avail themselves of the chance, as evasions are dangerous, and peculiarly so in a country where the popular sentiment sets in so strongly against the further alienage of real estate.

There are a few who bode alarm, thinking the Act may divert a large amount of European capital from this country, but it is almost certain they are borrowing a deal of imaginary trouble. But be all this as it may, no good reason can be given why it is desirable that any considerable portion of land in this country should pass into the hands of owners who owe allegiance abroad, and many of whom do not even admire our system of government, and there are very many reasons why a system of foreign landlordism should not be allowed to take root in our soil.

This feeling is evidently spreading. An alien land bill has been advanced to a third reading in the Illinois Legislature, and it is believed the measure will pass both houses and receive the approval of Governor Oglesby. This bill provides that hereafter aliens, before being allowed to purchase land in that State, shall declare their intention to become citizens of the United States. Should they fail to take out their naturalization papers within six years thereafter, such lands shall revert to the State.

The bill also provides that all aliens who now have lands in that State shall become citizens within three years after the passage of the bill.

The bill is said to be specially aimed at a foreign landlord who has gobbled up thousands of acres, chiefly in Logan county, and is doing his best to transplant the odious rack-renting system in this country, and the people of the State are determined to nip the enterprise in the bud.

Chico Gets the Normal School.—The commissioners appointed to choose a site for the new branch Normal school, north of Marysville, having returned from their inspecting tour of the competing towns, met in San Francisco and decided to locate the school at Chico, on the beautiful eight-acre orchard lot offered by Gen. Bidwell. The building, which is to be of brick, three-storied, will stand on the bank of Chico creek, within a few rods of the General's handsome residence. The citizens guarantee permanent water right for all water needed for school and irrigation purposes, free of cost, and $10,000 for beautifying the grounds. There was great joy in the winning city over the success achieved.

The Los Angeles Flower Festival was formally opened on Tuesday evening last. The pavilion was crowded, and the door receipts amounted to nearly $3000. Among the visitors were Gen. Miles and staff, the City Council and other officials. Though the exhibits were not all reduced to order, the display of flowers was vastly enchanting. A single bank of roses in the center of the hall was estimated to contain 20,000. A floral ship, with mainmast 13 feet high, was one of the most noticeable designs. The opening address was by Mayor Workman. A grand allegorical procession is looked for every night of the fortnight the fair continues.

The Oakland Fruit and Flower Fair, to be held in Cavalry hall from the 18th to the 23d, promises to be a superb exhibition. Florists and horticulturists are evincing lively interest in and making active preparations for the display. Rare and beautiful plants will be shown by F. Delger, I. L. Requa, Mrs. F. M. Smith, A. Chabot, Mrs. Garber, Mrs. Deane and others. Beside the eight cash prizes which we referred to a fortnight ago, a special prize of $20 is offered for the finest display of cut flowers, to be made Tuesday by ladies of Alameda, Berkeley and Fruitvale. Mrs. John Deane, of Claremont; Mrs. Samson, of Alameda, and Mrs. H. Wetherbee, of Fruitvale, have been selected as a committee to make this award.

GROUP OF IMPORTED PURE BRED SUSSEX CATTLE.

Sussex Cattle.

Since well-bred cattle have become so popular in this country, there has been a reaching out to all parts of the world for breeds which are locally popular, and which can be brought here and still farther improved, as is the American method, with imported stock. Although much has been done in increasing our resources of various breeds, even to the bringing of the Brahmin cattle of India, there are plenty of breeds still to come, for the continent of Europe has still many excellent local favorites which are not yet popularized in this country. We have on this page a group of cattle from a breed which has a good history in England, but which has only lately become a candidate for favor in this country. They are the Sussex cattle, which bear a resemblance to the Devon, and according to Youatt, "unquestionably betray the same origin. "The cattle have been bred from the earliest times in the fastnesses of East Sussex, and have been kept free from all admixtures. The Sussex are beef cattle and it is upon the excellence of the Sussex ox that the fame of the breed rests. Youatt says: "The Sussex ox holds an intermediate place between the Devon and Hereford, with much of the activity of the first and the strength of the second, and the propensity to fatten and the beautiful fine-grained flesh of both. Experience has shown that it possesses as many of the good qualities of both as can be combined in one frame." The cow is described as of little account for the dairy. The breed coming from the hilly pastures of Sussex is bred to thrive on an uneven country, and to do well on pastures only moderately set with grass.

The band of Sussex cattle shown in the engraving is the property of Overton Lea, of Nashville, Tenn. The bull, General Roberts, in the foreground, was calved in March, 1882, in England, and won prizes as a yearling in 1883 and the first prize as a two-year-old at the Royal in 1884. The same year he was imported to this country by Mr. Lea. The weight of the bull on moderate feed was 2209 pounds. The cow on the right, a four-year-old, Milkmaid, and the two-year-old heifer on the left, Rosedew, were both imported by Mr. Lea from famous Sussex herds. It is claimed that Sussex cattle have fine size and maintain great weight upon the system of feeding common to all cattle on the farm—plenty, without any attempt at forcing.

Santa Barbara County Notes.

Editors Press:—The graders of the branch Southern Pacific railroad are now working in the valley of Carpinteria. As a consequence of the boom, incident to the building of the road and opening up of this section, lands are going up in value, far above the intrinsic worth of any crops that can be produced here, as so many are anxious to get a slice of the "glorious climate." Several transfers have been made in Carpinteria at from $250 to $400 per acre, for land without buildings or trees; and $600 per acre was refused for 20 acres of walnut trees. Two new towns are being laid out here on the line of the railroad. In the city of Santa Barbara the boom goes on. Many fine residences and business blocks are going up. The city is lighted by electricity and various other improvements are in operation.

The County Horticultural Society is thoroughly alive, and will hold its annual rose festival and citrus fair on the 13th, 14th and 15th of this month. This flower and citrus fair is one of the specialties of the county, and can nowhere be beaten. The fair this year will be held in the Agricultural Pavilion and will undoubtedly prove a greater success than ever, the accommodations heretofore having been too small.

Fruit and walnut trees are blooming full. Thousands of olive trees have been set out in the Santa Ynez valley and vicinity, and will, in time, make that section one of the largest oil-producing regions of the world. The grain and hay crops throughout the county are in need of rain, and will suffer severely if it does not fall soon. Along the coast heavy fogs now prevail and help the growing crops to some extent. Some corn and beans have already been planted, the farmers fearing that the rainfall after this will be very light and therefore wishing to save what moisture there is in the ground from the last rain.

H. L. Williams is down over 400 feet in his oil-boring operations on Ortega hill. So far he has passed through two small veins of oil, but not in paying quantities. He is now working in sand much resembling seasand.

L. B. Cadwell.

Carpinteria, April 4, 1887.

From Tuolumne County.

Editors Press:—The Granger sings a new song of joy, this seventh day of April. The rains bathed the foothills last night with nearly 1½ inches of water—a baptism really necessary to insure even half a crop. All nature this morning wears a gladsome look. The verdure that was dying is springing up into renewed life. The fruit trees were changing from blossom to germ, and this rain is just what was required for a full setting.

Plenty is written all over for this season, and our faith in the goodness of an overruling Providence grows stronger the longer we live and take note of passing events. When we put ourselves in the scales with that unseen but not unfelt power, we become small and helpless indeed. As a general rule, crops did not suffer so much as feed; the hills were drying up, and the lone spots with shallow soil. The roots of grain did not wilt much, but its growth was retarded for lack of moisture.

At noon, appearances indicate more rain, and it is probable that the storm will continue until after full moon. If frosts come not, the fruit crop will be more abundant than for years The old Wadsworth place has been sold to parties from below for the sum of $2700—the first of our boom. The place is on the Mountain Pass road, adjoining James Goodwin's noted orchard. It is coming! Our foothills will yet be appreciated for their intrinsic worth.

April 7, 1887. John Taylor.

Vacaville Notes.

Editors Press:—The glorious rain has come at last and brightened up the faces of the farmers, as well as the trees and grass. There has fallen at Vacaville, in this last storm, 2.18 nches, and probably more will follow. Rain was needed as badly as I have ever seen it needed in this county in 30 years. On the plains between Dixon, Elmira and Cache Slough, the summer-fallow is from 12 to 18 inches high and very thick, and now will probably make big crops. Of the winter sowing, but very little is able to see over the clods, and what heads out will be very light. Grain is two weeks later than last year at this time. The hay crop will be light and short. The fruit prospect is better than ever. The late rains will be a great benefit to fruit, notwithstanding the statement of one of our large fruit-growers to the contrary. In many of the orchards, clod-mashers were going before the rain. Now the ground can be put in fine order with a harrow. The last time going over the ground is generally done with a weed-cutter. This implement is made with a frame like a sled, from 4 to 6 feet wide, and a cutter-bar of steel, a quarter of an inch thick and about 5 inches wide, sharpened on both sides and turned up square at the ends, so as to fasten to the runners with an iron clamp. The knife can be raised or lowered, and is usually run 3 or 4 inches deep. This cuts everything that it runs over, is very cheap, and does good work where the ground is not too wet. There is no patent on it, and any blacksmith can make one. G.

Vacaville, April 10th.

Fruit Marketing.

The California Fruit Union.

H. A. Fairbank, Secretary, on the part of the Directors of the Fruit Union, has issued the following statement:

The shipping season is advancing very rapidly, and while notifying you of the action of the Board taken March 14, 1887, by which the 4th installment of 25 per cent is now called, it might not be out of place to outline in a general way the anticipated plan of action for the coming season.

It was deemed best by the Board to send a fruit-grower, one who alike with us all would be interested in securing the best possible service the coming year, East, with instructions to thoroughly canvass all the principal markets—to personally investigate and establish connections of some character in *all* cities which can take fruit in car-lots; to acquaint himself, where agents to sell on commission are appointed, not only with their financial standing, but also their business qualifications and peculiar fitness for handling our particular line of the commission business; and having brought to bear the leverage of competition, to make the best possible terms with them as to commission to be charged; the principal aim this year being to develop markets as yet almost untried.

Our president has been selected to undertake this work, and intends starting about the latter part of May; and after working the matter up thoroughly in the East, establishing agencies and making contracts with the same in cities where it seems best, and getting into working order the machinery for handling by auction in others, he will return and present his report to the Board for their approval.

At the beginning of last year, that we ought to be able to ship fruit was simply a theory. The past season proves the theory a correct one. We *did* ship fruit, and consequently Eastern commission-houses being cognizant of the fact, we not only expect but already have received offers from a number of the largest houses, who last year desired 10 per cent commission, to take the agency of the Union at a much cheaper rate.

We can see no reason now why the business may not be very successfully conducted the coming season.

The strife of last year, and consequent competition in our own fruits, is effectually done away with, as the most prominent shippers are now associated with us, and we are all working earnestly for the same result—the advancement of the fruit interests. Those who desire to sell their products can now do so to our own members, and your fruit so sold will not be put on the market to break the price for your neighbor who prefers shipping on his own account, the intention being to so regulate shipments through our General Manager that no markets are glutted, and especially to put forth every effort to develop new fields, to the end that we can successfully (to our pockets) handle the immense amount of fruit which must, of necessity, be shipped out of the State.

Should but a comparatively small proportion of the prospective crop, from the present outlook, be put in a green state upon our local markets, we venture to assert that 1½ cents per pound would be the highest figure that even the most fortunate shipper would average for his crop.

Our stock is not assessable, so that when you have paid this, the last call, your stock is then paid in full, and nothing more can be collected upon it.

The revenue of the Union for defraying expenses, etc., must be derived in the following way: Each one consigning fruit through the Union pays 10 per cent commission. Of this amount, as different markets require different amounts, the commission merchant retains whatever is agreed upon, but at the highest, a commission of not to exceed 7½ per cent, and returns the difference, certainly 2½ per cent, possibly more, to the treasury of the Union.

This amount of rebate, if you so desire to term it, on the volume of business, at the unusually low prices, done by the two organizations of last year—now consolidated—will yield an income to the Union of $17,500, an amount which will amply pay all possible expenses, together with a dividend to the stockholders.

Should the business so increase in coming years that we find we are accumulating a large reserve fund, as the by-laws prescribe that dividends on stock shall not exceed six per cent, we can easily, by reducing the commission charged all consignors, reduce the income, because, as we understand it, the corporation is not designed to be a money-making investment as regards stockholdings, but simply a co-operative movement for our protection, which we desire at the same time to be self-sustaining.

We anticipate a great many have deferred remitting the third call, which was made Sept. 24, 1886 (as nearly $3000 still remains unpaid), because they were waiting to see what arrangements would be made for operating the business the coming season.

To all such we would say we now see no reason why they should not at once remit whatever may be due from them as delinquent payments, together with the fourth and last installment of 25 per cent now called. With all working in harmony, the disastrous results of last year *cannot* be repeated, and it must surely be presented with a great deal of force to every thinking mind, after looking about at the amount of fruit which we will have to take care of, that in the successful operation of this or a similar organization lies the prosperity of every one who has money invested in fruit property.

While a few associated together can surely bring about some good, to accomplish the best results we must *all* put our shoulders to the wheel, and while we are working out our own financial problem we will be benefiting one another as well.

The Board after deliberation decided that they could not in justice ask those who *did* pay their obligations to drag along those who did not, and so fixed the date as the 1st of May, after which all who have not paid the amount they owe the Union will be debarred from all privileges.

While to some these may not have been apparent, they certainly have existed, though few in number to what all concede we may now expect for the future.

Gratified at the outlook for a successful year's business, some of our largest stockholders have paid in full and taken more stock, in order to place the organization on its feet financially, as we are still some $700 in debt.

Had all the stockholders of the Union been as prompt in the payment of the calls, as they have been made, as has been the one of our members who certainly, if any, had reason to repudiate his obligations and complain at the results of last year's shipping—he having not only received nothing for seven cars of fruit, but at the same time found himself a very large amount in debt—there would have been no need for this fourth call. Certainly, many who are yet hesitating about sending the small amounts which may be due from them would do well to profit by this example.

Trusting that you will not only be prompt with your responses, but that you will influence your neighbors, who may not as yet be with us, to become members, we remain respectfully, H. A. Fairbank, Secretary.

California Fruit in New York.

We find in the New York *Market Journal* of March 26th the following notes on California fruit in that city:

Leading handlers of California fruit in this market give it as their opinion that if the Interstate Commerce law does not "play hob" with transportation, sales of the grapes, pears, plums, apricots, etc., of that section will be far more extensive this season than in any previous year.

Mr. Joshua Cromwell, of Fulton street, sold last year nearly 60 carloads of California grapes, and he believes that his sales can be largely augmented this season. Through his efforts these delicious grapes—the Muscat and other varieties—were last season distributed about among the people so extensively that, having once got a taste of them, they will surely demand more at anything like reasonable prices.

That shipments of grapes from California to the East were last year not altogether profitable was due, not so much to the large quantities sent forward as to the fact that so many of them were in poor condition when they arrived here. It is believed that twice the quantity received last year might have been disposed of profitably if they had come through direct to New York, and without delay in transit.

But at least ten times the quantity of California grapes were sold in this market last year over any previous season, and the heaviest shippers declare that the returns made from the New York market were altogether more satisfactory than those from any other point in the country. Many people will earnestly hope that our supply of this fruit of the Western vines will not be diminished this year, but that, on the contrary, it may be increased, and those whose enterprise has introduced and popularized the delicious fruits of California among us may find a permanent and profitable business in continuing to supply them.

A Large Fruit Auction-House.

The long-agitated question of having a new auction-house for the daily sales of fruits and produce has at last taken definite shape.

Some 15 or 20 of the leading fruit and produce-dealing firms of the city have associated and formed a Limited Stock Company, with a capital of $100,000, which has decided to establish an auction house at once, for the daily sale of produce and green and dried fruits, both domestic and foreign.

It is rumored that the new company has secured a building for the purpose in Park place above Greenwich street, and it is also stated that the stock of the company is in eager demand by the fruit and produce trade, who see in the movement the promise of a great success.

Sheep and Wool.

Improved Saxony Sheep.

Editors Press:—Being much interested in your illustrations and description of the Improved Saxony sheep in the Rural of January 22d, I wish to make further inquiry about them. The thought suggested by your article is: May it not be a profitable breed for California sheepmen to try, particularly in this section—Southern Humboldt—where there is no trouble from seeds and burs? How do they compare with the American merino for hardiness? and will they do well in large bands? What is their disposition—quiet or roving? And most important of all, what is their weight of fleece? Is it well set—that is, a large number of fibers to the square inch of surface? Those in the engraving seem to be as well covered as a merino. Our California climate might prove with them, as with other stock, to be just the thing, with intelligent handling, to bring them to the highest perfection in quality and weight of fleece, as well as constitution and form. More information on the subject would be very acceptable to the sheep-breeders of the State. —Rancher.

Editors Press:—I will endeavor to answer the queries of your correspondent "Rancher" in regard to improved Saxony sheep.

1st. "How do they compare with American merino for hardiness?"—I consider them more hardy than the American merino. The wool has much less grease. I think it requires as much feed to put grease in the wool as would fatten the animal. And if extra feed is not given, such animals decline in flesh and health. A certain amount of grease is necessary and healthful, but too much is a drain on the vitality of the animal, and is only a waste of feed.

2d. "Will they do well in large flocks?"—We never keep more than 100 or 200 together. Our land is fenced and divided into 10 or 20 acre fields, and not suited for very large flocks. They do better in flocks of that size than any other breed I know of.

3d. "What is their disposition—quiet or roving?"—They are very quiet; have been kept in inclosed fields for generations, and, if hunger is satisfied, will lie down contented.

4th. "What is weight of fleece?"—They are not heavy shearers. When bred up to XXX and above and brook-washed till clean, in order to secure the price of fancy wool, from four to five pounds for ewes and young sheep and eight or nine pounds of washed wool for rams. The washing reduces the weight about one-third.

5th. "Is it well set or compact on the sheep?"—Not so close on the sheep as the American merino, but still not what would be called open wool. They are well covered over the body, extending over the belly and legs. They are a great improvement over the first importations. I think they are a class of sheep that would be suitable for California. Of course, it can only be ascertained by experiment. We claim that they are hardy and active, and will secure for themselves a good living if it is in reach. They have much better feet than the merinos. I think it would be well if some of your breeders would give them a trial. They combine the highest priced wool on a good mutton carcass. They are as large as the merino, and much easier fattened.

John G. Clark.

Lagonda, Wash. Co., Pa.

The Wool Market.

The Sawyer Tanning Company of Napa, under date of April 1st, issues the following circular letter:

Owing to the uncertainty of freight rates East, we are unable to issue our regular price-list at present, but will do so as soon as we can determine what arrangements are to be made for shipping wool, hides and leather to New York and Boston.

To-day's San Francisco papers give rates by rail as follows: Wool, $3.85 per hundred; dry hides $4.65, and leather $5.05, from San Francisco to New York.

These rates will doubtless prevent all shipments until a different tariff is made. What the new rates will be, or when they will be made, is a matter of very great uncertainty.

We may get some relief from Pacific Mail, but it is doubtful. We propose to hold our product for lower rates or at least until it is determined whether we are to have favorable rates or not. We intend, until further notice, to reduce our prices on pelts, wool, hides and goatskins about ten per cent below prices given in our last price-list. This would bring sheep pelts with 6 or 8 months' growth of wool at from 75 cents to $1 each; 8 to 12 months' growth $1 to $1.25; shorts from 4 to 6 months, 50 to 70 cents; shearlings, 15 to 25 cents.

We recommend consignors to hold dry hides until rates are established, as we consider rates given prohibitory of shipping. Goatskins are in full supply and declining in price — reduction fully ten per cent. Deer and furs remain about the same.

We would advise great caution, as matters are in a very unsatisfactory condition. In addition to this trouble with freights, we have to report a very dull and declining wool market in the East.

Manufacturers complain badly of low prices obtained for goods, and beyond a doubt very low figures are now obtained for both wool and goods in the great markets of the East.

We hope to be able soon to report a better state of affairs.

The Ornithologist.

Dr. Gally on Birds and Bugs.

Editors Press:—This is in Pajaro valley, on the bank of the Pajaro river, on the side of Santa Cruz county, Monterey being on the other side. I've been living here 12 years, raising fruit, etc. Nearly every year, as soon as my cherry trees began to put on the white robes of constancy to the season—that is, to blossom—along came a swarm of dear little birds, such as linnets, sparrows, finches and a particularly mean bird—greenish-brown bird, with a long, slim beak—that looks some like a catbird, which is away back in Ohio and Pennsylvania. His further description I leave to the ornithologers, begging only further to say that this bird is no account—can't whistle, can't sing worth a cherry stone, and he is not pretty.

Well, every year, until this year, these birds come swarming in greater or less numbers just as soon as the cherries begin to bloom; and they cut the cherry blooms right across, behind the white flower leaves, till in a single day's work the ground under the tree boughs looked as if snowed upon. Now, I want some smart man or woman to inform the generous public where the birds have gone this year. The trees are loaded with blossoms—never man saw the like—too many blossoms for any good use, but no birds, or, if any, so few that their work would not be noticed by any but an experienced sufferer from bird ravages, or by an expert horticulturist.

I have read lots of eloquence, gush, mush, slush and blathering about having a board to hunt up, identify, arrest, quarantine, convict and execute the bad bugs.

They want a board, they say—why, gentlemen, it will take a whole lumber-yard and a bushel and a half of microscopes, and even then you will not get your work all in. The reason I so conclude is partly from the fact that 50 years ago, in Ohio, Pennsylvania and West Virginia, the women rose up "as one man" and resolved to obliterate the bedbug. They went to work at once. I watched them for over 25 years, scalding, soaping, poisoning and poking into nail-holes after the bedbugs; and I have reliable information that they are still at it—that is to say, they, or if the mothers have gone across the eternal river, then their beautiful motherly daughters of the rising generation. The women of America—more power to them—still wage relentless war upon the wingless, odorous, walking abomination of the midnight hour, yet he, the bedbug, like the stars and stripes at Fort Henry, "is still thar."

Now, if the women of America in half a century cannot destroy one kind of bug, how are a few old political stiffs and antiquated apple-sass men going to meet the gorgeous host of entomological hostility that swarms the brilliant balm of California's atmosphere? Go to; let every man in California, like every woman in the East, fight his own bugs, and if he will not fight 'em let his neighbors complain of him as a nuisance. That's all the law need do, except to look out for new importations.

But here is a plain thing. Birds are big enough to be seen, and ought to be easily traced with the naked eye; and I want to know what has become of my birds—where and why did they go? Will any of the bugs follow them?

J. W. Gally.

On the Farm, near Watsonville, Cal.

The Public Lands.

Limitations on Alien Land Owning.

The following is the full text of a law approved by the President on the 3d day of March:

An Act to restrict the ownership of real estate in the Territories to American citizens, and so forth.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that it shall be unlawful for any person or persons not citizens of the United States, or who have not lawfully declared their intention to become such citizens, or for any corporation not created by or under the laws of the United States, or of some State or Territory of the United States, to hereafter acquire, hold or own real estate so hereafter acquired, or any interest therein, in any of the Territories of the United States, or in the District of Columbia, except such as may be acquired by inheritance or in good faith in the ordinary course of justice in the collection of debts heretofore created; provided that the prohibition of this section shall not apply to cases in which the right to hold or dispose of lands in the United States is secured by existing treaties to the citizens or subjects of foreign countries, which rights, so far as they may exist by force of any such treaty, shall continue to exist so long as such treaties are in force, and no longer.

Section 2. That no corporation or association more than 20 per cent of the stock of which is or may be owned by any person or persons, corporation or corporations, association or associations, not citizens of the United States, shall hereafter acquire or hold or own any real estate hereafter acquired in any of the Territories of the United States or of the District of Columbia.

Sec. 3. That no corporation other than those organized for the construction or operation of railways, canals or turnpikes, shall acquire, hold or own more than 5000 acres of land in any of the Territories of the United States; and no railroad, canal or turnpike corporation shall hereafter acquire, hold or own lands in any Territory, other than as may be necessary for the proper operation of its railroad, canal or turnpike, except such land as may have been granted to it by Act of Congress. But the prohibition of this section shall not affect the title to any lands now lawfully held by any such corporation.

Sec. 4. That all property acquired, held or owned in violation of the provisions of this Act shall be forfeited to the United States, and it shall be the duty of the Attorney-General to enforce every such forfeiture by bill in equity or other proper process. And in any suit or proceeding that may be commenced to enforce the provisions of this Act, it shall be the duty of the Court to determine the very right of the matter without regard to matters of form, joinder or parties, multifariousness, or other matters not affecting the substantial rights either of the United States or of the parties concerned in any such proceeding arising out of the matters in this Act mentioned.

Approved March 3, 1887.

Horticulture.

Tree-Growing.

Editors Press:—One of your correspondents wants information on this subject. Perhaps my limited experience may be of some value. For eucalyptus, I fill shallow boxes three inches deep with rich soil, very sandy, so it will not bake with repeated waterings. I sow broadcast the seed, so as to have a seed or more to every half inch; sprinkle an eighth of an inch of sand over the seed, and over this a slight covering of sawdust. In hot sun a protection of barley sacks would be advisable. Water as often as to keep the soil in good growing condition. In two weeks the seed will be up. When three to six inches high, flood so as to make a soft mud, knock off one side of the boxes, remove the trees carefully, so as to save all the roots; do not expose them a moment to the sun or wind—I prefer a cloudy day—and set where they are to remain permanently. In this locality, October is the time to sow the seed, and they are ready to transplant in the spring; and by fall some of them will be six or eight feet high. I have tried transplanting large trees, but never with success.

I sow Monterey cypress in rich, moist soil, in the ground, the same as beets or onions, in the spring; if the sun is very hot, protect them with barley sacks or brush till they come up; keep them well cultivated during summer, and the following spring they are 6 to 12 inches high, and ready to transplant permanently. I do not scald these, or eucalyptus seed. They never failed to start passably well, with such seed as I have bought in the market, and the trouble is very little, and much better than to buy the trees, as they are already at hand, and can be set at one's leisure time, and little or no exposure to sun or air.

My wife once sowed some pepper seed, taken, I think, from trees growing in Santa Barbara. This was not a success, as I believe but two of them came up, and yet it *was* a success, as one of the trees is now growing where it was originally sowed, and it is worth a hundred-fold the cost. Yes, it is best for one to raise his own trees, for, in this case, he will think more of them, and take better care of them, enjoy them better—*have* them. In the other case, he may have them, and he may not.

Santa Barbara Co. S. P. Snow.

The Golden State Almond.

Editors Press:—In reply to your inquiry under date of March 31st, concerning the new seedling almond now growing in the Oak Shade orchard, and briefly referred to in the Dixon *Tribune* some time since, I will say that the description given was substantially correct, except that the tree is now ten instead of eight years old as stated, and has for some years past borne full crops without a single failure.

The nut is a large soft-shell, and has a full smooth-skinned meat. The nut parts from the hull readily, and if left on the tree will fall out of itself. It ripens from four to five weeks earlier than the Languedoc and the famous foreign variety known as the Taragona.

Its present position in the orchard was due most likely to oversight; and though recognized as a seedling, it was through neglect permitted to remain, until its real worth was established on the third year by a full crop of fine almonds; and season followed season disclosing new merits, until in an orchard surrounded by many thousand trees of Languedoc almonds it is in no perceptible manner favored by soil, location or treatment, and has borne from 40 to 50 lbs. of nuts yearly for the past two years. This nut, which I have named the Golden State Almond, is destined in my opinion to take a front place among the almonds raised at this day. One of its great advantages is that as it ripens so much earlier than the foreign variety, the Taragona, it can be gathered and shipped East before the Taragona is put upon the market. My confidence in the superiority of this almond over all others is such that I intend budding 60,000 trees this summer, the larger portion of which I shall plant in an orchard of my own.

Such, in brief, is the history of the Golden State almond, and any further particulars, if required, will be cheerfully given on application.

Webster Treat,
Manager Oak Shade Orchard.

Davisville, Yolo Co., Cal.

The Dairy.

The North Pacific Dairymen.

In one respect at least the dairymen of Oregon excel their California brethren, and that is in maintaining a dairy society for discussion and action upon matters affecting their industry. Their last meeting was held about two weeks ago. The report in the *Farmer and Dairyman*, of Portland, states that a committee was appointed to confer with the officers of the Domestic and Fat Stock Association, to make arrangements, if practicable, to hold an exhibition of dairy products in connection with the fat stock show next fall. The following constitute the committee: Messrs. J. B. Knapp, P. C. A. Heilmann and D. C. Stewart.

A resolution was passed indorsing W. B. Baker as dairy commissioner, and recommending his reappointment by Gov. Pennoyer.

President's Address.

The President of the society, Mr. J. B. Knapp, delivered the following address:

To the Officers and Members of the North Pacific Dairy Association: Since our last meeting the Legislature of the State of Oregon has met, held its usual session, adjourned, and its Acts have passed into history. Among the Acts passed by that body was an Act amending the dairy law of the State. The amendments were substantially those discussed and recommended at the last meeting of this association. Oregon has now a good dairy law, and I confidently hope it will give dairymen and consumers of dairy products all the protection needed. In one respect the law is still defective. While it declares that pure, unadulterated milk, and butter made from the cream of the same, shall be furnished to customers, and a severe penalty attached for its violation, it has given no declaration or standard of pure milk, of what should constitute in a legal sense, or determine the standard of purity. Suppose a dairyman is delivering milk to his customers, or to a creamery, and is accused of adulteration. The dairyman asserts his innocence, and perhaps litigation ensues; experts are called as witnesses, and authorities are consulted to establish what should constitute pure milk. Had the law declared that milk of a specific gravity of 1030 and 12 per cent volume of cream should be considered and regarded as pure, the contestants would have a positive and legal standard for comparison; and any person of common intelligence with simple instruments within the reach of every one, at a cost of less than $1, could determine the question of purity or adulteration to his entire satisfaction without trouble or cost.

The committee on legislation appointed at our last meeting to secure the needed amendments to the dairy law were divided on this question. A majority of the committee insisted on establishing a legal standard for the pure milk, believing if such standard was established disputes that might arise would be more readily adjusted and settled without resorting to legal forms. A minority of the committee opposed such standard, and rather than go before the Legislature, divided upon any amendment we asked; the majority gave way and consented to have the question of standard of purity left out altogether. Had such standard been established it would render the law more positive and easier of execution.

But as it is, we have a good dairy law. Any citizen feeling aggrieved on account of adulteration of milk, or short weights in butter, can remedy the matter peaceably himself, or failing to do that, can readily bring the offender to justice.

Dairymen had now better examine their butter molds, and if found too small cut out and enlarge them till they bring them to the required standard weight of two full pounds. Oregon dairymen are now relieved of the unjust discrimination against them by short-weight butter imported into the State and sold to dealers at actual weight, and to consumers by the roll, enabling the middleman to make a double profit and thus offering him a premium to discriminate against a home-made article.

The consumer has now ample protection against adulterations and the short-weight swindle. Both consumers and producers ought to be happy. Oregon dairymen have now a fair field before them, and no unjust discriminations against them. With very favorable conditions of climate, soil, and pure water, he has the elements of success within his reach. If he cannot now succeed the fault is his own.

Good, thorough, honest dairying will insure success. Without it the best quality will not be produced. Superior quality commands ready sale at the best going prices. Each and every one should make it his especial aim to produce the very best.

Should any lack in experience or the knowledge requisite to success, the State has provided the means to furnish ample instruction. Section 13 was added to the dairy law, authorizing the dairy commissioner, either by himself or by his deputy, to give a course of lectures in each county on dairying, when called upon by the citizens of any county to do so. There are several publications devoted to the dairy interests, giving from week to week valuable information on practical dairying, so there is no excuse for ignorance on this subject. The State has done nobly for the dairy industry. It has given us a law affording ample protection to producers and consumers, and furnishes free instruction in practical dairying to those wanting it. What more could we ask? What more should we expect?

It now rests with the farmers and dairymen to work out the problem, and honest work will bring success.

Uniformity of quality and color is a very important element in determining the commercial value of butter. Let 20 or 30 farmers having 20 cows each make their butter at home, and there will be as many different qualities of the product and as many different shades of color. The quality of each and all may be fairly good, but the commercial man has little confidence in it. Let the cream be gathered from each of those dairies, taken to a central creamery, worked by an expert, and the product of all combined will be uniform and of one color. The product will rate as first-class, and the commercial value in the market will be 25 per cent greater than in the first case.

The establishment of creameries, which I have often advocated, will contribute very materially and rapidly to the success of dairying in Oregon. In this way farmers and small dairies can sell their milk or cream to cheese factories and creameries, and realize more for it than to work it up at home, and get rid of all the work and drudgery of doing so. The day of small dairying and selling the product to the nearest country store is past. There is nothing in it for profit; better feed the milk to calves and pigs and save the labor.

The Oregon Law.

Mr. Paulsen, of the Legislative Committee, stated it as his opinion that the amendment as to a maximum specific gravity mentioned in Mr. Knapp's address, would not have passed the Legislature, and that he found a strong opinion among many of the members averse to the continuance of the dairy law, and against making an appropriation therefor. While he would have been willing to see an amendment of the kind referred to, he thought the opposition was too great. He said that 12 per cent of the volume of cream as the minimum for cream, as asked for by some of the members of the committee, was in his opinion too large. The result of 44 tests in the analysis of milk, as made by Dr. Stevenson Macadam (*American Chemist*, May, 1875, page 149), shows as the highest specific gravity for cream, 11.25, and the minimum, 5.00, and an average of only 7.8. The British Society of Public Analysis fixed on the following as the minimum for milk, viz.: Fat, 2.50; solids, 9.00; water, 88.50; total, 100.

Mr. Paulsen said that among the amendments passed by the last Legislature, the one referring to the feeding of "brewer's waste" was the most important one regarding the production of pure milk, and the amendment requiring full weight of packages and rolls the most important one as regards butter.

Mr. Knapp spoke of the opinion of the Governor and some of the members at the opening of the Legislature, for the repeal of the dairy law, but after the necessity of the law was explained to them their opinions were different.

Mr. Baker: An important direction of the law, until changed by the last Legislature, required the commissioner to take cases of violation to the grand jury room, where parties charged with offense against the law were allowed to explain that they were not intentionally violating the law, and had tried to obey its provisions. The present law, as amended, gives justices' courts jurisdiction in cases of violation. Mr. Paulsen has been active and energetic in working for the dairy law.

Yield of Oregon Milk.

Mr. Heilmann: I have been corresponding with the proprietors of several creameries in Oregon, inquiring as to how much milk it requires for every pound of butter made, and the reply came from the Farmington creamery that they used in test, 23.86 pounds of milk to a pound of butter; J. West, Westport, 25 pounds; W. N. Ruble, Syracuse creamery, 30 pounds; H. W. Koch, Woodland, W. T., 22 to 28½ pounds; Brownsville creamery, 12½ to 38 pounds of milk to each pound of butter, the test showing a wide variance, probably owing to breeds of dairy stock, their condition and treatment, and the condition of the cream, etc.

Mr. Collins, of the Hillsboro creamery, reported a test made there required 21½ pounds of milk to make one pound of butter.

Dairy Feed.

Mr. Stewart, recently from a trip East, and referring to the question of ensilaging in Oregon, says that he has seen many different plans of storing ensilage in the East, and has given the question some consideration in applying the principle here. He has been advised by Jared Miller, whom he regards as good authority, that ensilaging need not be given the consideration in this State where we have mild, moist winters and grasses are lasting and root crops abundant, as the dairymen have to do in the East, where the winters are more rigorous and the reign of green pastures short.

Mr. Scott: The cheapest green feed for winter forage, as I have found from experience, is a variety of cabbage called the thousand-headed cabbage, which is easily cultivated, producing 25 to 30 tons per acre, and if planted early in the fall will attain hardiness enough to stand our mild winters, practically growing all the while in the field and ready for gathering as needed to be fed to the stock.

Thickness of Human Hair.—Measurements have shown the thickness of the human hair to vary from the two hundred and fiftieth to the six hundredth part of an inch. The silkworm's thread is one five-thousandth. Blonde hair is the finest and red the coarsest. Taking four heads of equal weight, a patient German physiologist found the red one to contain about 90,000 hairs, the black 103 000, the brown 109,000, and the blonde 140,000.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Arcadian Duties.

[Read before an open meeting of Tulare Grange, April 2, 1887, by J. W. Mackie, W. L., and furnished for publication in the RURAL PRESS.]

My brothers, sisters, comrades and friends: I greet you in the name of Tulare Grange, and address you because that privilege has been assigned me and is one of the duties of the office to which I have been elected. I crave your indulgence in advance, as I am but a recent importation into this neighborhood and agricultural pursuits, consequently my experiences and observations in matters pertaining to farm-life and duties are very limited. I am not as well qualified to speak as those who have borne the heat and the burden of the day. Nevertheless, I attempt the honorable, and, in many respects, pleasant task assigned me, like a true Granger, and leave all responsibilities on the shoulders of the Grange.

Peace, tranquillity, happiness, have been the ascribed conditions of life on the Arcadian plains, where nature, reveling in sweetness and purity, greets the farmer at every step. Poets have wasted much paper manufacturing spring poetry and rhyming the praises of every season, month, and day of the year. Insects, birds, flowers, fruits, cereals, and everything which moves, or has root or leaf on the farm, have all been forced to contribute to poetic fancies and illusions. Poetic fancies and illusions, for nearly everything over which poets sing themselves into ecstasies is the enemy of the farmer and destructive of his peace, tranquillity and happiness. Where the poet sees beauty and inspiration, the farmer sees weeds, pests, and never-ending labor. Instead of peace he finds warfare. He is doomed by nature to be a fighting man. He must fight or die. With the uncertain elements, over which he has as yet no control, he wages an unequal warfare, being able only to watch and study their apparent whims and caprices, and take advantage of them. Then he has to fight gophers, squirrels, rabbits, and a host of four-footed pests; and declare war against an innumerable army of insidious insects of every hue, shape, and diminutive meanness. In the heavens above, on the earth beneath, in the waters under the earth and on the earth, are lurking the enemies of the farmer, taxing his wakeful vigilance to the utmost. Farmers must fight. They fight one another. It has become a habit.

But there is a class of enemies the farmer does not or cannot fight. To fight that class demands a cessation of hostility among the farmers; to fight that class requires unity of action and co-operation, which do not exist in farming districts. While the daily never-ending warfare of farm life is going on; while farmers are toiling and contending with natural enemies and with one another, "From morn to noon, from noon to dewy eve," this other class of enemies is watching and waiting for fitting opportunities; a class who, like the lilies, do not toil neither do they spin, and it is questionable whether Solomon in all his glory was ever clothed like one of them. Not finding any necessity for work, not being required to thus waste any time, their thoughts and genius are employed in devising plans to get from the farmers, from their little surplus after the devastations of minor enemies, "all that the traffic can bear." And every year the farmer is surprised to find this little surplus getting less and less, after so much toiling and fighting.

Every one remembers the delight of childhood in following the fortunes of an apple-pie through the tortuous and torturous gauntlet of the alphabet. The fate of farm-produce is similar, say a crop of wheat, which, after animals, insects, the elements, headers, thrashers, warehousemen, merchants, railroadmen, etc., have bit it, cut it, divided it, eaten it, fought for it, got it, and had it, how much is left for the producer? Is it fated that the farmer shall be forever on this daily treadmill of ill-requited toil? Is labor such a pleasant thing, such a thing to be in love with, that the farmer must hug it in his arms and be content with that and nothing more? So content with it that he has no time to destroy pests or fight his enemies, no time to read, no time to cultivate his mind, no time to meet in a Grange, no time for anything but to labor and be robbed? He has something else to do than dance attendance upon meetings, or bother his head with reform movements, or be inquisitive about railroad companies, who know enough to run their own business without his help, or make any special inquiry into the wholesale price of things and how to get goods at wholesale; merchants have to make a living and every one to his business.

How long will such a state of affairs continue to exist? As long as farmers remain isolated and separate, disunited and treacherous to one another, so long will they continue to toil and be robbed. Statistics notify us that farm-owners are growing fewer every year; that the farmers of America are destined to the fate of the sturdy yeomen of Old England, to be like them crushed out of existence. While Uncle Sam has been rich enough to give us all a farm, American independence has had a meaning; but in the near future, and practically *now*, all valuable land has been taken up, and when, at last, Uncle Sam has no more farms to give, when no land can be had except by purchase, then the grinding machinery of moneyed speculators and commercial sharks will be put in more active operation, till the lands will have passed from the hands of the workers into the hands of landlords, as in England, and the manly spirit of American freedom will be buried in the Potter's field of tenantry.

Will America ever become another Ireland? I hope not. I cannot believe that Americans will ever permit it; they will not if ever their eyes can be opened to see the maelstrom into which they have been drawn—drawn by the laudable efforts of individual thrift and industry and anxiety to gain wealth. The accumulative power of wealth obtained is now presenting its evil aspect to us.

Solomon has said: There is a way that appears right unto a man, but the end of that way is death. It is so in the present and prospective condition of the farmer. With the advantages now obtained by capital in the fields of commerce, transportation facilities, in the legislative halls, over the free press and in usury, with the general inertness and passive submission of farmers to the divine right of money to rule, how long will it be before all the business of the country, with all the valuable lands, will be in the hands of a very few men who will virtually be the State itself?

Labor-saving machinery, working on large tracts of land, can produce cheaper and better than on smaller tracts, where such machinery cannot be introduced to advantage, even when the cost does not put it beyond the reach of the small farmer. So the small farmer cannot compete. Year after year finds him going still farther behind in the race, every year still farther handicapped and less able to compete, till, while he is working and wondering what the matter is, his land slips from him and he is left content to pick the crumbs which fall from the rich man's table in the form of tenantry or labor. Is it right that the possibility of such conditions should exist? Is the spirit of independence of so little value that we can afford to see it smothered to death by non-producing capital? Is it even good for the wealthy few that they should be dependent upon the muscular bounty of the laboring poor? Can the bone and sinew of the country be degraded and leave exalted its degraders?

But it is easy to draw the lines of this dark picture to croak and find food for despondency and despair, easy to discourage the coward and hypochondriac—the question now is: What are we going to do about it? "Do about it?" I will tell you—we Grangers are going to give you no peace night or day; we will buttonhole you at every corner; we will invade the sanctity of your homes and by entreaty, by persuasion, by argument, we will compel you to meet with us and devise the remedy. For this meeting together is of itself the first letter in the alphabet of freedom. We must break up this individual isolation, this segregated and separate action of farmers, each one plodding along, the easy prey of designing and selfish men and the victim of his own stupidity.

Ireland is to-day what it is, not from foreign foes, but from internal factions and social jealousies. A united Ireland would have been an independent Ireland. Switzerland and Montenegro are among the smallest of European principalities, but their united purpose and action have enabled them to preserve their independence against fearful odds. United action based on a united purpose will cause farmers to be respected, and less open to the treacherous designs of the parasites who feast and fatten on the farmer. He must get rid of these parasites—not by American concentrated lye, but by American concentrated action and concentrated intelligence. The parasite does not believe that the farmer has intelligence. The farmer has become the laughing-stock of every moneyed fool. Even the Chinaman, in dealing with the farmer, says: "Mellican man alle same foolee man."

How long shall we permit this? When will it cease to be the fashion to associate clod-hopping with ignorance and stupidity? It will not cease until we unite in proving our intelligence, proving it by managing our own business and retaining the fruit of our labors instead of dividing it with speculators and corporations. Intelligence! There is no branch of industry in the world which makes so large a demand on science as farming. The full-fledged farmer must know something of chemistry, mechanics, civil engineering, natural history, physiology, medicine and indeed every department of practical science; and the more he knows, the more successful as a farmer he is likely to be. The natural education of the farm compels him to be a walking encyclopedia. It is disunion, and disunion only, which makes the farmer a fool and the easy prey to united capital. It is slavery to the farm, isolation and the not meeting together and co-operating, that consumes so much time that we have no time to attend to our best interests. It is short-sighted selfishness that prevents combination. Whereas, by united action, the farmers can control all transportation facilities and place their produce where it is most wanted at the right time. By united action they can get its full value. By united action we can make all the laws referring to our interests by sending practical farmers to Congress and the Legislature, instead of professional politicians and broken-down lawyers, who cannot make a living at their own profession, and whose interest it is to make laws as obscure and ambiguous as possible. By united action the farmer can impress his natural and naturally acquired intelligence upon the character of the State, and make every institution in it jubilant with life and spirit derived from the whole-souled, great-headed and muscular farmers of California.

Friends, to-day let us take one step forward on the works of the enemy; let us counsel one another as to the best means of effecting a combination of farming interests, whereby we can have the best tools at the least expense, the best produce with the least waste, and all the happiness, comfort and independence to which the farm is entitled. To facilitate this movement, Tulare Grange invites you into her councils and membership, to take part with her in advertising to the world how noble, intelligent, and self-reliant farmers can be, and that they are the backbone of the country, and mean to be, as they should be, its head, heart, and hand.

Come into the Grange, where our wives, sisters, and sweethearts can participate, by whom our cruder ideas are mellowed and refined, and made fit to appear in company, by whom our courage and flagging spirits are revived and warmed into enthusiasm, and who prevent us from flying off at a tangent into wild schemes of only visionary importance; whose deeper insight, purer spirituality and intuitive quickness of perception keep us continually in the safe paths of wisdom, in spite of our more ponderous caliber. These sisters invite you, and you will deem it a privilege to be so associated, and the day of your initiation will be ever remembered as a red-letter day in your life and the turning point in your better fortunes.

[We have also received a report of the other proceedings of the meeting at which the foregoing essay was read, but, for lack of space, are obliged to defer its publication until next week.—EDS. PRESS.]

Memorial Services.

At a meeting held to pay the tribute of fraternal regard to the late Mrs. Runyon, the memorial committee of Franklin Grange reported as follows:

Worthy Master, Brothers and Sisters: Your committee, to whom was assigned the sad and sacred duty of preparing resolutions in memory of Sister Mary K. Runyon, beg leave to submit the following for your approval and adoption:

WHEREAS, In view of the loss we have sustained by the death of Sister Mary K. Runyon, and of the still heavier loss sustained by those who were nearest and dearest to her; be it

Resolved, That it is only a just tribute to the memory of the departed sister to say that in regretting her removal to a higher Grange, we mourn for one who was in every way worthy of our respect and esteem.

Resolved, That we sincerely sympathize with the bereaved husband, sons and brothers, and realize that they have lost a loving and devoted wife, mother and sister, and commend them for consolation to Him who orders all things for the best, and whose chastisements are meant in mercy.

Resolved, That a copy of these resolutions be spread upon the minutes, and a copy be sent to the family, the *California Patron* and the RURAL PRESS for publication.

MRS. E. S. JOHNSTON,
MRS. H. P. FLEXMAN,
MRS. S. G. BRADFORD,
Committee.

In moving the adoption of the resolutions, Mrs. E. S. Johnston said: "Sister Runyon became a member of the Patrons of Husbandry in Franklin Grange, No. 147. The Grange was in its infancy; she was with us in our most palmy days; she also stood by us when trouble seemed hovering over us, feeling a deep interest in the farmer's common cause, and we have no reason to doubt her loyalty to the last. Our sister was sadly and severely afflicted with a long and lingering illness; but she bore it all with a cheerful, Christian fortitude that it would be well for us to imitate when the hand of affliction rests heavily on us. It was my privilege to visit her in her sickness, and I have never ceased to admire her courage and patience through it all. To her children I would say, follow her bright example; put your trust in Christ who died for you and her. To her husband I would say, hold fast to the faith you have acknowledged and all will be well in the end."

The other members of the committee also added words of eulogy and sympathy.

GRANGE ITEMS.—The *Patron* mentions that an open meeting is to be held today, April 16th, at Point of Timber Grange, Byron, where addresses are expected from W. M., Johnston and W. L., Flint; that Enterprise Grange also is to have its annual reunion today, 16th; That in the death of O. S. Freeman, in the 72d year of his beneficent life, Elk Grove Grange realizes the loss of a good Granger, a kind, genial neighbor, and a good citizen; that the officers of San Joaquin Pomona Grange (a list of whom, as elected, was given in the PRESS of Dec. 4th last), were recently installed, all being present but the G. K., Bro. Sollers.

GRATEFUL TO BRO. OHLEYER.—The Yolo Board of Supervisors last week voted Geo. Obleyer $300, as that county's proportion of the expenses he incurred in making two trips to Washington and carrying on the anti-debris contest in Congress.

The Sad Ending of a Secret Society to Which I Once Belonged.

[Written by ANITA M. DEWEY.]

Several years ago two other girls and I, having heard of the good doings of certain clubs, resolved to form one. For this purpose we held our first meeting at the house of one of our members. Considerable business was done at this meeting, such as adopting a name for the club, making badges, electing officers, agreeing upon a password and the rules and regulations to be observed by the club. The officers elected were president, secretary and treasurer. I was elected secretary — which proved very unfortunate, as will be seen farther on. Having this office, I had the pleasure of copying all the rules, regulations and secrets, and the minutes of each meeting in a book kept for the purpose.

Certain boys being very inquisitive—as boys usually are—determined, if possible, to find out all the secrets and doings of this club; so whenever we were met by any of these boys on the street, we had to undergo a certain amount of questioning before we could go on our way in peace. The boys being unable to gain any light on the subject in this way, determined to watch their chances for getting hold of the club-book. For this purpose my brother—being one of these boys—kept close watch to see where I put the book, after club-hours. They were soon gratified by my carelessness.

The club, having had a meeting at my house, decided, after closing, to go out in the yard for a game of croquet. Without thinking, I left the book on the piano in the parlor. My brother, having kept good watch, went immediately into the parlor as soon as we went out. Seeing the book, he picked it up and read it through. It is needless to say that in a few days the book was shown to every boy in the neighborhood, and that was the end of that club.

After awhile we formed another club, this time taking the boys into full membership, thus following out the noble example of the founders of the Grange, when they opened wide their doors to woman. This proved a success. It still lives and is flourishing. I am *not* secretary, but have often been asked at home, whenever clubs have been mentioned, if I would not like to act as one. I think some clubs accomplish much good, providing they elect a good secretary.

NOTE. Read at the Harvest Feast of Temescal Grange, Oakland, March 19th.

Grangers' Business Association.

The annual meeting of the Grangers' Business Association was held in this city April 13th. Daniel Inman, who has for several years been president of the association and has rendered excellent service, declined re-election to the Board of Directors, and the stockholders' meeting adopted resolutions expressing much regret at his retirement and esteem for his past efforts in the interest of the association. The following were chosen Directors for the coming year:

A. D. Logan, Colusa; A. T. Hatch, Suisun; J. W. Mitchell, Turlock; Charles Wood, Danville; E. W. Steele, San Luis Obispo; J. C. Campbell, Maxwell; J. C. Merryfield, Dixon; Th. Upton, San Jose; T. E. Tynan, Modesto; S. E. Biddle, Hanford; I. C. Steele, Pescadero.

Business for the past year was stated, and the report of the manager, E. Van Every, was received with considerable gratification by the numerous stockholders, as it shows the house to be one of the most flourishing institutions on the coast. The profits of the business were large and on every hand an increase in the various departments is shown. During the season, the warehouse has received grain far in excess of its capacity, and in order to accommodate its numerous customers, the association has been compelled to construct an addition, in the shape of a shed 625 feet long—running the entire length of the building. The small percentage of loss on the extensive business transacted is a source of great gratification to the stockholders and a credit to the management. This house, by its constant attention to the interests of its agricultural patrons, has of late become very popular with the farmers of our State, and is now receiving its reward by the extensive patronage accorded it.

The directors organized by electing I. C. Steele, president, and re-elected A. D. Logan, vice-president, and Chas. Wood, secretary.

SONOMA POMONA GRANGE.—The meeting of the Pomona Grange, to be held at Santa Rosa on Wednesday next, April 20th, promises to be very enjoyable. The following program is announced: 1, music; vocal quartette, by members of Sebastopol Grange; 2, address, by J. P. Whitaker, of Bennett Valley Grange; 3, select reading, by Miss Fanny Gamble, of Santa Rosa Grange; 4, vocal solo, by Mrs. G. W. Huntley, of Sebastopol Grange; 5, address, by Hon. S. M. Martin, of Two Rock Grange; 6, vocal quartette, by members of Sebastopol Grange; 7, address, by S. T. Coulter, P. M. of State Grange; 8, suggestions by members for the Good of the Order; 9, closing song, by the Grange.

GRAND JOINT PICNIC APRIL 23.—The great picnic in aid of the Gridley Monument Fund, of which mention was made in the RURAL of 2d inst., is to be held at Good Water grove,

Stockton, Saturday, April 23d. General admissions have been fixed at 50 cents. Public-school children under 12 years of age will be admitted to the grounds for 10 cents. The members of the joint committee seem very enthusiastic in their work, and bound to beat the record on picnics.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

The President has appointed the members of the Interstate Commerce Commission. The lawyers are well represented, but it is to be hoped that they will act fairly, and administer the new law in the best interests of all concerned. It has been interesting to note how many conventions and meetings of railroad officials have lately been held to "interpret" and "construe" this law. These meetings have been held in all parts of the country, and railroad lawyers and attorneys have, of course, "interpreted" and "defined" the law in as "favorable" a light as possible for the corporations affected. It would be well if the farmers, who, *most of all*, are interested, would also hold meetings and discuss the Interstate Commerce law. Every Grange could profitably make it a subject for consideration for several meetings, study it thoroughly, understand *all* its provisions, and so become armed with the weapons of *truth* and *knowledge*. Already the signs seem to point to efforts being made to have the law appear ridiculous, to make it oppressive, to keep before the public its "hardships," etc., and, without doubt, for some time at least, many complaints will be announced by the assertion that "It is all the work of the Interstate Commerce law."

The favorable action of Congress on the Interstate Commerce bill has stimulated the people, and particularly farmers, to make new exertion, with a hope for permanent and final relief from unfair and unequal management of railroads. The "Farmers' Assembly," of Virginia, in its session of February last, was outspoken in this direction in its platform so unanimously adopted. A few planks from this platform are of general interest, and are worthy of adoption and action by the farmers of other States as well.

Section 3 reads; "That railroads are highways opened by the laws and authority of the State for the convenience and reasonable accommodation of the people of the State, and are not made solely for the pleasure or benefit of the corporations who operate them; that the State in granting such franchises acts as a trustee for the people of the State, and as such trustee is bound to see that the terms of the trust are strictly carried out, and whenever there is an effort on the part of such corporations to use their franchises against the fair interests of the people of the State, then it becomes the duty of the State by proper legislation to interpose for the protection of her people. We therefore demand that the Legislature of the State shall pass such laws as will prohibit discrimination by railroads between localities and individuals, requiring the publication of their tariff of rates, and enforcing these and other measures of needed relief by adequate penalties and agencies."

Section 4 says: "That we indorse the measure lately passed by Congress, known as the Interstate Commerce bill, as a step in the right direction, giving the producers and shippers of the country this measure of relief; that the power to discriminate between persons and localities claimed by railroad managers, their lobbies, agents and attorneys, is but another device for taxing one class for the support of another; that neither the State nor the Federal Governments possess such power, and are therefore incapable of delegating it to the railroads; that the exercise of such a power by the creature of the State is, in effect, to take value from the land and products in one section and bestow the same value upon another."

"We call upon our State Legislature to be vigilant in restricting, with proper limitations, the charters to be hereafter granted to corporations. Charters to railroad companies should rigidly restrict them to the business of common carriers; they should be prohibited absolutely from owning, directly or indirectly, real or personal property other than that actually necessary for their business of common carriers. We regard the system now practiced by certain railroad companies of buying up, so as to monopolize, the coal and other mineral lands of the country, as pregnant with the greatest evil; to corner *fuel* would be scarcely less disastrous than to corner *bread*, and would place the consumer at the mercy of monopoly in the price to be paid for this necessary of life."

After thus plainly stating their position on these and other important questions affecting the interests of their State, these Virginia farmers say in their platform: "We hereby express our unalterable determination to support no man who will not aid us honestly and faithfully in obtaining relief from the grievances complained of. * * * While disclaiming any affiliation with extremes, we invoke the assistance and co-operation of all laborers, whether in the field, factory or elsewhere, and ask that such unite with us and make a common cause against a *common enemy*."

PROGRESS.—*Fourteen more new Granges.*

Reports of Grange work and progress in Virginia are full of encouragement. A number of Granges have been reorganized, and new members are being heard from.

IT is to be regretted that the dates of the two Grange picnics, at Clements and at Danville, come so close together—the former on the 6th and the latter on the 7th of May. This near succession was not intended, and may debar some from attending one or the other. On future occasions, perhaps, the like may be avoided by more general consultation ere the day is set.

MORE GRANGES IN TULARE COUNTY.—Brother Overhiser reports another Grange preparing for organizing in the school district, six miles west of Tulare city. The farmers in the "citrus belt" near Visalia are also desirous of reorganizing. Visalia should also soon have a strong Grange reorganized.

TEMESCAL GRANGE will confer the 3d and 4th degrees, meeting at 2 o'clock to-day.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

SWEETS IN A SANCTUARY.—Oakland *Enquirer*, April 8: The carpenters at work on the Catholic church at West Berkeley, last Monday, discovered a beehive in the north wall, near the eaves. There is a space of about 16 inches between two of the ornamental columns in which the bees had made their cells and built layer upon layer, until the hive appeared to be the result of the labors of years.

Amador.

FORMING AN AGRICULTURAL SOCIETY.—Jackson *Dispatch*, April 2: A meeting of citizens, including a goodly number from Ione City, Sutter Creek, Plymouth and other towns in this county and a few from Calaveras, was held at the Courthouse last Saturday to take steps toward organizing a District Agricultural Society. A constitution was adopted and signed by over 100 of those who wish to become members of the society. The question of locating the fair grounds caused quite an animated discussion between the representatives of the different towns, the Ione and Jackson delegations doing most of the talking. It was finally agreed that a committee consisting of E. Ginocchio, of Jackson, B. Isaacs, of Ione, E. S. Barney, of Drytown, C. Gardello, of Mokelumne Hill, and H. A. Messenger, of Messenger's ranch, be authorized to select the place for holding the fair and to name eight persons to be recommended to the Governor for directors, and report at a meeting to be held in Jackson on Saturday, the 9th.

Butte.

A CITRUS SUCCESS.—The Oroville *Mercury* says of the Citrus Association's orange orchard which was planted last year: Not a leaf in the entire 30 acres has been hurt with cold, and but a few dead ones have been found. The grove, at this writing, is one of the loveliest sights in the State, and is being enlarged and becoming more beautiful every day.

CHICO CANNERY.—*Enterprise*, April 8: As far as Chico and vicinity is concerned, the fruit crop is unusually large. The Rancho Chico cannery is preparing for a big pack. Men are busy all the time making cans, and there are about 100,000 now on hand. This cannery last year put up all the surplus crop on the Rancho Chico, and bought the products of other orchards as well. Canned fruit of last season's pack is being shipped East from Chico constantly. Yesterday a carload lett for Chicago, and the day before one left for Kansas City. The supply is almost exhausted.

Calaveras.

FOOTHILL ORANGES.—April 5th, Capt. J. W. Tyler, of Jenny Lind, Calaveras county, brought to the Stockton *Independent*, samples of oranges raised on his place in the foothills. The oranges were large, sweet and delicious, and compared favorably with the choice varieties of Southern California. The trees on Capt. Tyler's place were seedlings and are now nine years old. They grew without any shelter and were always exposed to the weather.

Contra Costa.

ORANGES IN SAN RAMON VALLEY.—Martinez *Gazette:* "I. H." states in the RURAL PRESS that the people of San Ramon valley make no claim to being in the citrus belt. If they do not, they ought to. Having been raised there, the writer can assert, with the knowledge of over 25 years' experience, that no climate in this county, and, so far as his wanderings have been, in this State, is more uniformly mild than that of the San Ramon valley, reaching from Walnut Creek to Danville. It is a little paradise, and if oranges won't grow there, the climate in the Garden of Eden was altogether too frigid for producing semi-tropical fruits. We have in our mind's eye a certain orange tree in Mrs. Van Patten's charming garden whose succulent fruit we tasted 'way back in our early boyhood days, and we can't be made to believe that oranges quite so sweet and all-persuasive as those were have ever been grown anywhere since. That orange tree has flourished and bloomed and borne its golden fruits year after year for almost 20 years—a solitary but convincing witness of the Edenic climate of the beautiful San Ramon valley.

Humboldt.

HAS FAITH IN THE INCUBATOR.—*Standard:* Geo. Gibson, of Worthington Prairie, is going into the poultry business on a large scale. He has an improved patent incubator in service, and the chicks are coming in flocks. One hatching resulted in an increase of about 100 chickens, and about 20 dozen eggs are now in process of hatching. The venture ought to be remunerative.

Lake.

EDITORS PRESS:—In our county we have a fine prospect for a good crop of grain and hay. The outlook for fruit, also, was never better; prunes, peaches, apricots, almonds, pears, olives, all promise an abundant yield. Alfalfa looks as well as we could wish. Sheep are doing well and promise a good clip of wool this spring. The grape is likely to pay well in the near future. The two samples of wine I send you were pressed from the grape last fall by George Thorington, of Lakeside Ranch, six miles north of Lakeport. The light claret is made from the Zinfandel and the white from the Reisling. The grapes grown on Mr. Thorington's land give a very high percentage of sugar, which will produce a fine quality of wine or raisins. Real estate is looking up in Lake, as we expect soon to have cheap and quick transit to your city by rail. We will say in conclusion to the Easterner, looking for a little home where he can spend the rest of his life in peace and happiness, where crops never fail, where the climate is mild and everybody at peace: come to Lake.—A. H. POE. [We received the two samples mentioned by our correspondent, and they seem to us to be good of their kind; but we do not profess to be judges of the article.—EDS. PRESS.]

Lassen.

WINTER LOSSES.—The *Stockman* learns, from parties lately in from Susanville, that the death rate among cattle is greater this year than for years previous. In the vicinity of Fort Sage, Long valley, hunters report seeing large numbers of dead cattle on the range, and the stench from the decaying animals which greets the nostrils of travelers in that section gives credence to their statement. Further north the loss has not been so great, as the stockmen, with few exceptions, succeeded in driving their cattle to places of safety, where they were fed as long as the snow remained of any considerable depth. Levy & Alexander, at Horse lake, are said to have fared the worst, but as they succeeded in buying considerable hay, paying $10 a ton, it is thought their loss will not be so great as was first reported. Within the past few weeks the grass has started up, and the people look forward to a prosperous season.

Los Angeles.

RESPONSIVE TO GOOD TREATMENT.—Anaheim *Gazette:* F. H. Keith has 1½ acres in orange trees, which are well taken care of and fertilized. As a result, he harvested 400 boxes of fruit from this little bit of an orchard, making a net profit of something over $600 an acre.

Mendocino.

THINNING THE COYOTES.—*Dispatch and Democrat:* R. L. Simmins, of Little Lake, made a lucky shot recently which netted him $15, but the sheep-growers thereabouts gained more than that amount, for the coyote he killed would have soon been the mother of seven puppies. The animal's scalp was delivered to the county.

Napa.

SEEDS FROM ASIA.—St. Helena *Star:* Miss L. Kelley, late of India, has made Mr. and Mrs. Elwood a very important present—nothing less than an assortment of different seeds indigenous to India. There are 36 kinds, among them chuna, the principal horse-feed of that country, and dal, a grain that forms a staple article of food of the people. Some of these have been planted and are now growing. Great pains have been taken to make their growth a success. Some have been sent to the State University, and another lot to A. R. Meserve, of Pomona, who is a very careful cultivator. This gives a wide range for trial, and we hope to know the probable successful varieties this season.

San Benito.

MENDING A HORSE'S LEG.—Hollister *Advance:* W. I. Reed's pet colt, under treatment for a broken leg, is progresing favorably. The injured limb was set and placed in splints, and the whole surrounded with plaster of paris. The animal is kept in such a position as to be unable to move the limb, and seems to understand just what is required of it. Animals with broken legs are generally killed, but Mr. Reed proposes to show that there is no necessity for such action.

San Bernardino.

A NOVELTY IN ORANGES.—*Valley Echo:* J. E. Cutter put an orange under the editorial proboscis, and said: "What does that smell like?" We thought it reminded us of soda-water somehow, and finally replied, "Pineapple." "Correct," responded Mr. C.; "it is a Florida pineapple orange." It was our first experience of an orange with a decided pineapple flavor.

San Diego.

MOUNTAIN APPLES.—San Jacinto *Register*, April 7: Wm. Hicks, a pioneer farmer of San Gorgonio mountains, was in town last week with a load of fine potatoes. He has one and a quarter acres set out in apple trees, which yielded 13,000 pounds of apples last season. Some specimens were as choice as any we ever saw on Front street, in San Francisco, and prove that our high mountains are adapted to raising this fruit. Mr. Hicks cannot raise too many of the kind of apples that we had the pleasure of eating last fall, and we hope he will go into the business on a larger scale.

San Luis Obispo.

A PLACE OF PROMISE.—San Luis Obispo *Tribune*, April 8: Corbley Johnson is located a few miles from Adelaide, and the remarkable growth of vines and fruit trees on his place has several times been noted in the county papers. While his attention has not been specially devoted to fruit-raising, he carrying on diversified farming, he has about 150 bearing fruit trees—apple, peach, plum, etc., all of which have done remarkably well. Grape-vines last year grew 28½ feet during the season; fruit trees two years old, girth 18 inches; gooseberries and Lawton blackberries show a growth of 16 feet during the season and were loaded down with berries. His ranch is about 1200 feet above the sea. There was no frost there this year sufficient to kill tomato-vines until February. Figs, almonds and oranges thrive; and, with the present railroad communication and the chance for a market, fruit-raising will be generally and largely undertaken in that vicinity.

San Mateo.

COLMA CABBAGES.—*Times and Gazette*, April 9: Residents of the First Township who own, or lease at reasonable rates, the fine cabbage-land of that section are experiencing a "boom." As high as $800 an acre has been netted by farmers of the Colma vicinage. The price per 100 pounds was $1.50 during the winter, and is now $1.40, at the railway station. Chicago, Minneapolis, Burlington and many other towns East are glad to have San Mateo county cabbages at an advance upon the selling price here, plus the cost of freight. Redwood City gardens have sent several carloads, while the eastward output from Colma has been continuous for many months. Of course, over-production may cause the supply of cabbage to so exceed the demand that present prices cannot be maintained; but we are assured that there would be money in cabbages at even 50 cents per cwt. Cabbages weighing 40 pounds each are now raised on land that has grown cabbages for over 20 years. An acre of fair cabbage-land produces from 20 to 30 tons. At even 50 cents per cwt. a 20-ton acre will net $200.

HORTICULTURAL COMMISSION.—At the supervisors' meeting, April 5th, a letter was received from Inspector Klee, calling attention to the need of immediate action to rid the county of the fruit pests now infesting many orchards. Thereupon, the following were chosen commissioners: Dr. L. D. Morse, of San Mateo; W. J. McNulty, of Woodside; Alex. Moore, of Pescadero. The clerk was instructed to notify those gentlemen of their election, and to request them to meet at the office of Dr. L. D. Morse on the 11th instant for organization and for districting the county. The board fixed the salary of the commissioners at five dollars a day for each member, provided that the aggregate days' work paid for to each member should not exceed 50 days in the year.

Sonoma.

ACRES OF BLOSSOMS.—Petaluma *Courier*, April 6: Cherry valley is something beautiful to look at at the present time, with its 5, 10, and 20-acre orchards in a solid mass of bloom. They resemble immense bouquets of white, pink and red blossoms. These little orchards are among Petaluma's brightest spots, and the cherries, peaches, apricots, plums, prunes, pears and apples are grown as fine here as anywhere in the State. This gives one an idea of what the colony system is, with little cottages, fruit-houses and barns, nestling in the orchards on the knolls and sunny slopes, and is a most peaceful and pleasant sight. The outlook at this season of the year was never better for a large yield of fruit.

Stanislaus.

RIVER FREIGHTS.—Grayson Cor. Modesto *Herald*, April 5: The San Joaquin river is at last in a fair boating stage, and the steamers and barges are getting the wheat storage along the river out rapidly. Freight is very low, owing to a fight between the boat companies. I understand they are carrying wheat at one dollar per ton from Hill's Ferry to Port Costa. They may be able to make money at that rate; if so, what did they make heretofore, when it was three dollars per ton? In early days here, in 1872, I have known freight to be six dollars per ton from Patterson's to San Francisco. This shows the march of improvement in handling freight, or else they were making fortunes then or losing money now. It may be rough on the boats, but it is good for the farmers.

Tulare.

FINE FRUIT AND GRAIN PROSPECTS.—*Tulare Times*, April 7: On Tuesday we received a sample of wheat and barley from a 200-acre field on the ranch of Stockton Berry, east of the Eighteen-Mile House and on the plains. The barley is three feet eight inches in hight, well headed and has a good growing color; the wheat is equally good-looking. It was raised on summer fallowed land, and its fine growth is attributable to thorough cultivation. Wm. Mehrtens and John Tuohy, neighbors of Mr. Berry, also have fine fields of wheat. A light shower of rain only will be needed to cause this grain to fill and make a large yield. * * * All fruits are early this season and setting well on the trees, promising one of the largest crops ever borne. The apricots are large already, and in a week or two should be thinned by the growers.

PREPARING TO CAN AND DRY.—The Visalia canning, fruit-drying and raisin-packing establishment will be ready for active operation as soon as the fruit season opens. The promoters of this enterprise propose to make a reputation for its products second to none in the State. Growers will be required to deliver at the cannery good merchantable fruit. To get such a grade, little care on the part of the grower is necessary. Good cultivation of the land and proper thinning of the trees will bring it.

Yolo.

REMARKABLE EGGS.—*Democrat:* Samuel Hiller has brought us a gigantic egg, which was laid by a hen on his ranch. The egg measures 8½ inches in circumference, and is a day's work of which any well-regulated hen might justly feel proud. It is on exhibition at this office. We have also seen, at Simpson's bakery, a curiosity in the shape of an egg within an egg—a small, perfectly formed egg about the size of a marble clinging to the shell of the outer egg.

Dewy Eve.

[Written for the RURAL PRESS by JOHN TAYLOR.]

Lazily the smoke doth rise,
Deep'ning shadows o'er darkening skies;
The crimson west proclaims the night,
A rest for man from his daily fight.

Come, dewy eve, with golden ray,
True lovers turn to thee alway;
Thy mantle hides the blushing rose,
And blesses life with calm repose.

The storms of time now quiet down,
No angry thought nor troubled frown;
A benison falls like an angel's psalm,
As evening sheds her holy calm.

Sweet hour of peace! why fly away
To usher in the god of day—
With all its troubles, stern and dire,
A crucible worse than refiner's fire?

Oh stay, thou sacred dewy eve!
'Tis heaven on earth; why shouldst thou leave
Poor, wounded hearts to bleed and die,
Changing from soft to frowning sky?

Ever on earth this change must be,
From darkening night we cannot flee!
Eternal morn will come apace,
And rest will follow life's fitful race.

Mt. Pleasant, April 7, 1887.

Bonnie Lassie.

[Written for the RURAL PRESS by HOONOS.]

"Then don't be sorrowful, darling,
Don't be sorrowful, pray;
For taking the year together, my dear,
There isn't more night than day."

Stopping his plow, a sturdy young man turned toward the house from which came the sweet girlish voice. There stood the singer, vigorously wielding the broom, not more than 50 yards away. She soon discovered that she was being watched. Laughing and shaking her broom at him, she called: "You'd better be at work, Bobby boy," and then inconsistently ran to speak to him.

"Good morning, Lassie," said the plowman, coming to the fence to shake hands with her.

"Good morning yourself," she answered saucily, tossing back her curls. "Father didn't tell us you were coming to work this morning. O dear! That will be one more to cook and wash dishes for. How long will it take to plow this field?" With a teasing look, as though she were not delighted to see him. Then, with a sudden change of tone, she told him of a book she had just been reading.

"Now go to work, naughty boy," she added; "*I've* got to. The idea of idling here when you have all that cornfield to plow!"

With a backward, saucy look, the girl ran singing into the house, leaving Rob, with a bright smile on his face, to continue the interrupted plowing.

The checked shirt and blue overalls did not hide Rob Raymond's manly, well-built form; and the wide hat, set far back on his head, exposed an honest, steadfast face, with earnest, hazel eyes, a firm but pleasant mouth just shadowed by a young mustache, and a square, determined chin. It was not a handsome face, but one would trust it instinctively.

Lassie's real name was Douglas, after her mother's favorite brother. Though disappointed that Lassie was "only a girl," she was determined to give her the name anyway. "We'll name her Douglas, anyhow, father," she said to her husband, "and call her Lassie."

And "Lassie" she was from that day, and the name well suited the saucy, willful, lively girl. Merry blue eyes, a nose inclined to be celestial, a sweet mouth whose constant smiles disclosed even, white teeth, a dimpled chin, all framed by the pretty brown curls, made up a face which was called the "prettiest on the creek."

Lassie and Rob had been friends and lovers since babyhood. Their parents had crossed the plains together and settled about five miles apart in the beautiful valley drained by Mark West creek. Now Rob's parents were dead, and the four boys, of which he was youngest, were separated. One had gone to sea, another studied law, the eldest tilled the home farm, and Rob was laying by what money he could earn by working out, to buy land for himself some day.

"And then, Lassie," he used to say, "I'll build me a pretty little cottage, and I'll go to housekeeping, won't I?"

"I don't know, I'm sure," would answer the teasing girl. "Will you invite me to the wedding?"

When Rob would cast a reproachful look at her, she would make a saucy face at him and run away. They were not engaged, and hardly knew they loved each other; yet whenever they thought of a home of their own they unconsciously thought of each other.

Lassie sang all the morning, that pleasant April day, as she helped the children get ready for school, churned the butter, made the beds and assisted her mother in preparing dinner. When her father and Rob came in from the field, she peeped out of the door and saw that Rob alone stooped over the sink, washing his hands. Seizing a dipper, she filled it from the bucket by the door and sent the water splashing over Rob's brown head. How she laughed as he sputtered and shook himself! At the familiar sound, Rob looked up and started after her. Lassie ran, but was soon overtaken and caught in a pair of strong arms. She hid her face, but with one brown hand Rob held both of hers and kissed her soft cheeks until they glowed.

"There!" he cried, letting her go at last, "take that for your sauciness! You can duck me again if you want to."

"No, I *won't!*" She pouted, stamped her foot, and seemed ready to cry. "You're a bad, hateful boy, Rob Raymond, and I don't like you one bit!"

She marched into the house with great dignity, but was not much comforted by her father's laughing "Served you just right, Lass." The spoiled child ran upstairs to smooth her ruffled curls and temper, and in a few minutes came down and ate dinner as though nothing had happened.

Such quarrels were frequent between the two. But as it was usually her fault if Rob kissed her, Lassie never stayed angry long. As she was only 16 and Rob 19, the old folks looked on them as children yet and thought nothing of their romping and quarreling.

After supper, Rob came into the kitchen and offered to wipe the dishes for Lassie.

"No indeed," laughed the girl; "I won't have a great lazy boy around to bother me. Mother, make him go 'way and behave himself."

Mother only laughed and left them together, well knowing that nothing would displease Lassie more than to have Rob leave.

"Ah, now, please let me stay," begged Rob. "I'll be real good. Mother McLane doesn't care if I stay."

With that he seized the dish towels and tucked them under his arm.

Lassie shrugged her shoulders and yielded, as she always did, at last.

"Oh, well," she said, in a resigned tone, "if you will stay, you will, and I can't help myself."

"Poor girl!" murmured Rob, "I'm awfully sorry for you. I say, Lassie," said the gallant dish-wiper, as they put away the last tin, "they're going to have a grand time at the picnic, Mayday."

"Is that so? Are you going, Bobby boy?"

"If I can prevail on your majesty to accompany me," and Rob made her a most elegant bow. "Bonnie Lassie, will ye gang wi' me?"

Neither Rob nor Lassie was Scotch, but he often tried to tease her about her name.

"I dinna ken," answered the provoking girl. "You'd better bide a wee, till I ken my ain mind. And while you're about it, do talk 'United States,' as Frank says, Bobby boy."

"I will, when you quit calling me 'Bobby boy.'"

"And I'll quit *that* when I get ready," with an emphatic nod of the willful head.

The silence that followed was impressive but short.

"Say, Lass," began Rob, "you haven't said whether you'd go to the picnic with me."

"I don't know. Frank may want me to go with him."

"Bother Frank! Do you suppose he'd want to go with his sister? Not much. He'll take Laura Mathews."

"*You* take Laura," coaxed Lassie, "and I'll go with Frank. Or perhaps you'd rather take Jennie Bennets."

"Don't you *want* to go with me, Lassie?" asked Rob, reproachfully.

"I heard that you said Jennie was the prettiest girl on the Creek," said Lassie, irrelevantly.

"Nonsense! Why, you know that *no one* in all this valley is half so pretty as you—bonnie Lassie," tenderly.

"Don't be silly, Rob," said the girl, smiling and dimpling with pleasure; for the rumor that Rob cared more for Jennie than for her had hurt her more than she would confess.

They went out on the porch to wash their hands. The moon shone softly upon the field of growing grain that sighed in the light breeze; upon the brown earth in the cornfield where Rob had been plowing; upon the lovely hills which surround the valley; and upon the rugged hight of St. Helena, which rises beyond the hills.

"How beautiful!' said Lassie, softly.

"Beautiful!" echoed Rob, letting his eyes wander from the moonlit scene to the girl's face, which shone spiritual and tender in the silvery light. He came nearer to her, irresistibly drawn by the sweet face. But that broke the spell, and with a laugh she flirted some water in his face and then turned to the roller towel which hung near.

"Lassie, will you go with me Mayday?" pleaded Rob.

And Lassie, with feigned reluctance, answered "yes," as she had intended to all the time.

* * * * * *

Mayday dawned bright and clear, and Lassie was as happy as a lark. For the weather had been cloudy and threatening, and she had feared she would miss the annual gathering.

In her pretty blue lawn, the girl reminded one of the shy, delicate nemophilas which tint the meadows. Rob looked his admiration when he drove up and found her in the garden, fastening a big bunch of pink roses in her belt. He begged for one bud, and being in an indulgent mood, Lassie pinned the prettiest one she could find on his coat. Years afterward she found this bud between the leaves of the little Bible Rob's mother had given him on her deathbed.

"There go the Wilsons," cried Lassie, waving her hand to a wagon-load of young folks, as she and Rob drove down the lane into the road.

"And there is Jennie with Charley White," said Rob, with a sly laugh.

Lassie blushed, and, to change the subject, asked if she might drive. Rob, who would have given her his head if she had asked for it, surrendered the reins at once.

"Ah, bonnie Lassie," he sighed softly, "how could you suppose I admired any one more than you?"

Lassie's cheek dimpled, and the relentless tease proceeded:

"But Jennie *is* a pretty girl. Such soft brown eyes, such a straight nose, such a smooth chin, and such glossy black hair in those pretty braids!"

By this time, Lassie was pouting and frowning most alarmingly. Seeing she was almost ready to cry with vexation and wounded vanity, Rob relented. The hood of the buggy hid them effectually, so Rob put his arm around her.

"Lassie," he whispered, "brown eyes have no charm for me while blue eyes smile on me kindly. Ah, don't shake those pretty curls over your sweet face. Let me kiss that dimpled chin—"

"Rob, Rob!" cried Lassie, struggling to free herself from his arms. But she was driving, so could not use her hands. "Let me go; some one will see us. Oh, let me go! I'll *hate* you if you kiss me. There!"

Dropping the reins, she dealt Rob's cheek a stinging blow. He let her go and grasped the lines just as they were sliding out of the buggy.

They rode on in silence. Rob's cheek burned as much from anger as from the blow. Lassie's eyes flashed dangerously. Both looked straight ahead, completely ignoring one another.

"You needn't have got so mad for such a little thing," growled Rob at last.

"Little thing, indeed!" snapped Lassie, taking refuge in fierceness to keep back the tears. "You wouldn't treat me so if you had any respect for me. It is perfectly contemptible of you to use brute force in that way to get a kiss."

"I didn't know you felt that way about it," said Rob more meekly, "or I'd have let you alone. But as for its being contemptible—I don't think it's contemptible to kiss a pretty girl any way you can."

"It *is!*" cried the indignant girl. "It is shameful to take advantage of inferior strength in any way."

"And you needn't think," continued Rob, not heeding the interruption, "that my kiss showed any disrespect for you. You looked so sweet and kissable that I couldn't help myself. I am but human, dear; and as for respect—why, Lassie, I respect you as I do the memory of my dear mother."

Mollified by this double compliment, Lassie consented to smile on him once more. As the truce was sealed by a hearty hand-clasp, they entered the picnic grounds.

Who has not been to a country picnic? The rosy-cheeked May queen, the songs and speeches by awkward boys and bashful girls, are familiar to all.

The grove commanded a beautiful view of the valley with its oak-dotted grainfields, its vineyards and orchards, and its numerous comfortable farmhouses. Through this peaceful scene the creek could be traced by its fringe of living green; while far in the distance the view was bounded by lofty hills clad in a mantle of majestic redwoods.

But the young folks, after lunch, careless of the view, impatiently waited for the tuning of the fiddle. When the merry dance tune at last rang out in the pure, sweet air, there was a hurrying to and fro, hunting partners. Rob sought everywhere for Lassie, and at last found her demurely flirting with a bright-faced young man, quite a distance from the platform. She pouted when told that the first set was forming, and went with Rob with such seeming reluctance that his sunny face was disfigured with a frown.

The scowl soon deepened, for, strangely enough, Lassie couldn't manage to keep any other dance for him. It was always "Just engaged, Rob—so sorry!" with a smile which belied her words. At first Rob chose other partners, but after one or two rebuffs he withdrew from the platform and watched Lassie with gloomy face. Cruel Lassie! When she scattered her smiles as recklessly as though she did not know how priceless they were to Rob, did she know what a storm she was raising in that young man's breast? She must have suspected, for whenever she caught sight of the frowning brow of her escort, she redoubled her smiles and shy glances.

The afternoon passed swiftly, and at last she spoke to the youth at her side:

"I must go home! Where's Rob? Oh, there he is by that big tree! Will you please take me to him?"

Reaching Rob's side, she dismissed her cavalier with a bow and a smile which left him in the seventh heaven of bliss, and signified to Rob that she was ready to go home. Without a word he helped her into the buggy and drove off. Lassie commented on the picnic, on the lovely weather, and on the people, but received no answer. Giving a scornful little laugh at this, she began singing, in a low voice, for her own amusement. They were passing a house where the thoughtful owner had placed a cup and a pitcher of fresh water on the gatepost, when Lassie spoke again.

"Rob! stop here," she said. "I'm thirsty. Please get me a drink."

He obediently stopped, gave her the reins, sprang out and got the drink. When he returned and would have taken the lines again, Lassie gave him a saucy look, as she started the horse and then held the reins out of Rob's reach.

"No, you sha'n't have them," she said, "until you can behave yourself. Smile at me—speak to me. Don't sit there like a ghost at a feast or a bump on a log. What is the matter, anyway?"

"You have treated me dreadfully to-day, Lassie," said Rob. "You had no right to flirt and dance with those fellows so much."

"And what right have *you* to say what I should do?" said Lassie, scornfully. "Here, take these reins," she added, dusting her fingers as though contact with anything belonging to him had soiled them.

"In the first place," answered Rob, "I was your escort, and—"

"*That* gave you no right to dictate to me," interrupted Lassie.

"It gave me a right to more consideration than I received," said Rob, hotly.

"And *I* had a right to repay you for your conduct this morning," retorted Lassie.

The silence which followed was at last broken by Rob.

"It was cruel of you, Lassie," he began in a quieter tone, "to treat me so. You *know* I love you. You know my life is worthless to me without you, and you ought not to torment me by flirting with those boys as you did."

"How was I to know you loved me, pray tell?" said Lassie, still angry. "I'm sure you never told me so before, and I'd never suspect it from your actions. I don't believe you ever did care for me or ever will, and I'm sure I don't want you to. You have no right to dictate to me, sir, and I'll have you understand that I'll dance and talk and flirt with anybody I choose to, and you'll have to stand it as best you can."

Lassie became more and more angry with every word she spoke. Petted and indulged all her life, she did not know what it was to be crossed or scolded, especially by Rob, who had always been her willing slave.

His unusual sentimentality that morning had startled and annoyed her, and now to have him scold her was more than she could endure patiently.

"Is that all you have to say, Lassie?" said Rob, with set mouth and a pained look in his eyes. "Has my lifelong devotion no value to you?"

"Devotion!" sneered Lassie. "Why, Gilbert Wright treats me better than you do."

They drove up to her gate as she finished speaking. Rob sprang out and helped her to alight. Then he turned to her, and, with the reins in one hand, held out the other in friendship.

"If you really feel that way, Lassie," he said sadly, "we had better part now forever. I'll go away somewhere and leave you in peace. You'll regret the way you have treated me some time, and feel sorry to think you have scorned an honest man's love."

"I wish you would go away, but I have no such hope," said Lassie, turning away from the outstretched hand. "You bother me dreadfully. If you stay here much longer I'll hate you."

With one reproachful look, Rob sprang into the buggy and drove away. As she saw him disappearing in the distance, she somewhat repented of her hasty anger. But, believing she would see him soon and "make up," she walked into the house with a triumphant step, feeling she had at last conquered him.

(Concluded next week.)

Anecdotes From Down-East.

A reader of the *Christian Register* (Boston) sends that paper the following anecdotes:

Once, while hearing a Sunday-school lesson, I asked, "By what other name was Jacob called?" expecting the answer, Israel; but the reply came at once, "Jake."

My little girl once said, after attending her first public entertainment, "I don't think people were polite; for, when the speaker got through, they clapped as though they were *glad*. I'm sure I was, but I shouldn't want to show it." Another child in the family, on seeing a live colt for the first time, asked, "When will the *rockers* grow?"

My faithful servant came to me one day, in tears, asking permission to leave her work to go to the post-office, as she had received word that there was a *dead letter* there, which confirmed a dream that she had had that some one was dead. She was highly indignant on her return, as the letter proved to be one written by herself to her lover in Erin, months before. This same girl came to me quite disturbed about some gloves that were mismated in the washing, saying they were not *comrades* at all.

My oldest boy, who had been taught to pray personally for his friends and schoolmates,

stopped in his prayer one night and asked, "What does 'neighborhood' mean?" I explained. "Then, God," he continued, "take care of the whole neighborhood!" He once fell from the barn-loft, scraping his leg fearfully, on which he remarked, "Well, I guess we'll call that a *narrow scrape!*"

A Few Vords Aboudt Boetry.

[Written for the RURAL PRESS by C. P. N.]

Der question vat vas in front of us at der bresent moment vas a teep von. Ve vill not addempt to oxblain der whole peesness of vat dot abstruct ting, boetry, vas, but vill say sometings aboudt vat der rabble dinks it vas or maype should be.

Some pig piles of shtuff vas been written py fellers who dink dey had more prains as somepody else hadn't, but idt aindt the piggest punkin as vas always der pest, now was hin? But O, my heart vas sore und mat ven some man as dondt can do nodtings but dalk of sometings he can't oxplain comes along und makes himself oudt dot he vas pig, you baed! I vas so madt ven I read aboudt some beobles as der men vas madt who had some chink in der pank dot der gashier dook wen he pusted der pank und shkipped.

"Boetry vas born, not made," ish der old sentence der vise man said, und you petter peleife idt. Boetry vas der art of oxpressing tings in der peautifullest as vell as der most easiest vay vot you couldt do (und sometimes vat you *couldn't* do) bud of you dondt make der tail end of der lines zound pretty close alike, or of you dondt gommence efery line mit a gapital ven dot vas all you could got oudt of your prains, vy, den it vas brose, und you baedder keep mum about being "boetry."

Bud ah! mine frients, gife me your ears und I dell you vot maype you dondt hear of already; ven you can dalk aboudt nodings, und ven you can dalk sometings you couldn't oxblain yourself, und ven you can make gapitals faster as you could in brose, den der vor.d vill gife you a boost und say you vas a boet. Idt dondt make some tifference vat you write, so long ash you dondt hurt nopody's feelings; of you rafe aboudt der peauties of natur und der sthar-lit heavens, und all der tings vat maype vas handy, you haf got der balance of der bublic py der ear; budt, mine frients, it vas more as baedder you dondt make boetry oudt of tings vat vas real goot for man to do, pecause you see man lofes generalties und he *dondt* lofe to pe bit. Dalk schoost so much as you blease aboudt lofe und peace, und all der oder gualities dot ve all like bretty vell, bud of you kick ofer der dhraces und sphoudt too many lectures you vill get der grand pounce so guick as you vink.

Der boet—der *dhrue* boet—vas a pig feller. His peesness dondt pring him too much money, budt in der eyes of der beoble he vas an elevated shentleman, roosting schoost so high as der pest of dthem. Shall he cast on der beobles der plack eye of scorn? Shall he grindt oudt from his stupendous prain such drash as vas so pad idt vas incomprohenserable und gonseqvently der boor, ignorant beoble tought it vas eggstra goot? Shall he—Oh, it vas pad, so pad I couldt not oxblain all I feel acrowding to der ben's boint. Blease vait a jiffy, vile I geep mine eyes from drownding.

My friendts, of you go mit der crowd you vas all hunky-dory, bud of you vill baddle your canoe so you hurt der objects of any von's bride, you baedder look oudt a leeddle. Maype you vas all righdt und maype not, bud dot dondt make some tifference; efery von vill dake a shy at you und you vill get knocked oudt.

In conclusion, ledt me gofe you some bieces of advices. Advices number von vas: Brose vas more as likely to be brose den boetry, budt a pig lot of shtuff vat vas called boetry vas nodings but brose. Advices number dwo vas: Efery man must suit themselfs, und of he vas happy you aindt got some righdt to comblain. Und my last advices vas: Most of us dondt got more prains den some oder beobles, und so ven ve gifes some dalks aboudt boetry ve baedder pile some charity on, now aindt it?

Haywards, Cal.

SHOW-CASE SHOES.—The beautiful varieties of boots and shoes that we often see in show-cases are not samples of salable lines, as a rule, but simply specimens of artistic manufacture made to attract attention. Passers-by instinctively stop and admire the marvelous combinations of rich color and fine workmanship, and are apt to envy the person who is to be the possessor of them.

YOUNG FOLKS' COLUMN.

A Fairy Tale.

You ask me for a story, dear,
A fairy tale of long ago—
Of dainty sprites and brownies queer
Who used to walk this earth below—
Well, pet, last eve I saw appear
A truly Cinderella, here.

Here in this room? Yes, dear, the moon
Filled all the earth with glitter bright,
While starry sky and crystal snow
Helped to reflect the radiant light—
Those are the times, as well you know,
When fairies walk this earth below—

I saw—all clustered by themselves
And dressed in brown of dingy hue—
Oh, many, many little elves—
Each looked like Cinderella, too,
As she sat alone by the fire that night,
And her godmother came, to her great delight.

You remember the tale? Well, these fairies, too,
Were discontented with their dull lot
And complaining among themselves—when, lo,
Their home was lifted from the spot
Where it had rested, and carried far
To a place as bright as the brightest star.

A golden light filled the air below,
New sights greet their eyes and new sounds their ears,
And on fiery horses, with radiant glow,
Their fairy godmother swift appears—

As they speechless gaze at the wonderful sight.
All discontent takes a rapid flight.

As she looks on each with her smile so warm,
Their hearts expand with a new delight,
Their old brown dress from their form is torn,
And they're dressed for the ball in robes of white;
How they dance!—but your laughter my tale has stopped—
Yes, the brownies were *corn and are now* ALL POPPED. —*Portland (Me.) Transcript.*

A Monkey and a Dog.

We don't suppose it is the same monkey and dog shown in the picture, but a delightful little incident is told in the *Irish Times* about a monkey and a dog. A brave, active, intelligent terrier, belonging to a lady friend, one day discovered a monkey belonging to an itinerant organ-grinder seated upon the bank within the grounds, and at once made a dash for him. The monkey, who was attired in jacket and hat, awaited the onset in such undisturbed tranquillity that the dog halted within a few feet of him to reconnoiter. Both animals took a long, steady stare at each other, but the dog evidently was recovering from his surprise and about to make a spring for the intruder. At this critical juncture the monkey, who had remained perfectly quiet hitherto, raised his paw and gracefully saluted by lifting his hat. The effect was magical—the dog's head and tail dropped, and he sneaked off and entered the house, refusing to leave it till he was satisfied that his polite but mysterious guest had departed.

Two Little Pigs.

One bright summer morning, as I was strolling toward the beach on the Island of Mackinac, I saw a short distance ahead of me two little pigs, one perfectly white and the other perfectly black, both the same size, trudging along side by side in the same direction as myself, seemingly engaged in earnest conversation.

They seemed so out of place, and I was so curious to know whither they were bound, that I followed them unobserved. They did not walk aimlessly, but as if they had some special object in view, and some definite destination.

I wondered what they would do when they reached the water. I was not long in being answered. Without a moment's hesitation they plunged into the waves side by side, and swam out and away toward another island, six miles distant. I stood and watched them until their two little heads looked like balls bobbing up and down, side by side, all the time.

When I related the incident to the landlord, a little later, he looked astonished and annoyed.

"Those pigs," he said, "were to have been served up for dinner to-day. They were brought here this morning in a boat from that island, and we thought we might allow them their freedom for the short time that they had to live, never thinking of their making an attempt to return home.

"And did you notice," he continued, "they chose the point of land nearest the island where they came from to enter the water? Singular that the little animals should have been so bright! And furthermore, they weren't landed there; that makes it more strange."

I, too, left the island that day, and I have never heard whether those brave little pigs ever reached their destination or not.

COMPROMISING.—"No, Bobby," said his mother, "you cannot go skating to-day. It's Sunday, you know."

"Well, ma," persisted Bobby, "can't I go if I'll just skate straight ahead and not try to do any fancy work?"—*Puck.*

GOOD HEALTH.

The Temperance Amendment.

Referring to the passage of the amendment to the school law, requiring instruction in the toxical effects of alcohol and narcotics to be given in the public schools, the Corresponding Secretary of the W. C. T. U. writes as follows:

Petitions were circulated in every part of the State and 13,000 names were thus secured asking for the passage of the bill. These petitions were presented by 50 different members of the Assembly, each for his own constituency. Of the names signed, just 10 per cent were school-teachers or officers, 395 were clergymen, 280 physicians, 250 lawyers and 50 *saloon-keepers.* The first petition offered was from the University of Berkeley, and bore the names in order of the whole faculty. Both Normal schools sent similar petitions, as well as many other religious and educational bodies. Notable among these may be mentioned the Sisters of Mercy of the convent and school of Mt. St. Mary's, their bishop sanctioning the movement.

The very capable W. C. T. U. Superintendent of Scientific Temperance Instruction, Mrs. D. J. Spencer, of Grass Valley, was in Sacramento during the entire session of the Legislature, and to her energy and perseverance is largely due the success of the bill.

Twenty States of the Union have passed this Temperance Instruction bill.

IN PRAISE OF MAIZE.—Among the good things which a reporter for the N. Y. *Mail and Express* has overheard from time to time in the elevated railroad cars is the advice of a noted physician the other morning, to a young man who complained of nervousness, loss of vision, night sweats, and a poor appetite. "Throw away your cigarettes, and eat a good bowl of mush and milk for your breakfast," said the learned doctor, "and you will not need any medicine. Indian corn is essentially an American institution. As the staple food of our daddies, it can really be said to have helped to lay the foundation of this great republic. With its product, the hog, it was, in the not very remote past, almost the sole food supply of the rural districts, and the dishes that can be prepared from its various forms are of much greater variety than can be prepared from wheat. Like Sambo's rabbit, it is good to roast, to bake, or to boil, and can be fermented and turned into whisky, but its stimulating qualities are best procured by making it into a mush. It contains a large amount of nitrogen, has qualities anti-constipating, and is easily assimilated. Though originally the poor man's food, it has come to be the rich man's luxury. It is cheap, and has great nutritive properties. A course of Indian meal in the shape of johnny-cake, hoecake, corn, or ponebread and mush, relieved by copious draughts of pure cows' milk, to which, if inclined to dyspepsia, a little lime-water may be added—will make a life now a burden well worth the living, and you need no other treatment to correct your nervousness, brighten your vision, and give you sweet and peaceful sleep."

DOMESTIC ECONOMY.

Brea as Fuel.

EDITORS PRESS:—As fuel is very scarce in Los Angeles county I will tell you what we burn in rainy, chilly weather, when it is necessary to keep a fire all day. The Spanish name is "brea." It is crude petroleum which runs out of the hills in many places in the southern counties of this State. The hot sun quickly evaporates the liquid part, or the coal oil, leaving the dregs or the solid part on the surface. It can be broken into chunks when cold, and is then ready for use.

We make a fire in the stove of wood and lay some of the brea on the wood. As it gets hot it melts and runs down over the wood and burns. The wood being covered with it, burns very slowly until the brea is burned. Without wood the brea would melt and run in the ash-pan. While the brea is burning there is a dense black smoke rolling out of the pipe which we do not object to at all; but what the cook objects to is the soot-tags which hang to the stove-plates as long as your finger. In a week or two the soot so clogs the draft of the stove that it has to be cleaned frequently.

I have only two points to make in favor of brea as fuel for domestic use. One is the price; as one cord of wood costing $9, and one ton of brea costing $3, will burn as long as three cords of wood at $9 per cord. This makes $27 for the wood alone, and only $12 for the brea and wood mixed. The other point in favor of brea is, it may rain on it all winter and does not injure it in the least; also the wood which you burn with it may be wet or green and is no detriment to the fire whatever.

In my next I will describe the oil-wells located five miles southwest of here. Also some of the many uses to which the oil is put.

Spadra, Los Angeles Co. D. J.

Polish for Ladies' Shoes.

EDITORS PRESS:—You would oblige me by telling in the columns of your RURAL PRESS of some reliable preparation for polishing ladies' kid shoes without cracking or injuring the kid.

San Jose. SUBSCRIBER.

BROILED LIVER.—Cut the liver into slices, scald it; take off the skin; wipe; season with salt and pepper; rub over with butter; broil about five minutes; serve with butter. Be very careful in buying liver to get it of a reliable market man, as no part of the animal is more liable to be diseased. Calves' liver is the best, as it is more delicate and in less danger of its being diseased. Slice and scald the liver as directed, and let the water stand on it for awhile to soak out the blood.

BREAD MUFFINS.—One cup stale bread-crumbs, three-fourths cup flour, half tablespoonful melted butter, 1 cup milk, 1 egg, 2 teaspoonfuls baking-powder, half teaspoonful salt; soak bread and milk half an hour; add beaten yolk of an egg, melted butter and salt, flour, baking-powder and white of egg beaten stiff. Bake in hot gem pans 30 minutes. This quantity will make a dozen muffins.

PAULINE MUFFINS.—Two and a half cups flour, 1 pint milk, 2 eggs, 1 tablespoonful sugar, 1 tablespoonful butter, 2 teaspoonfuls baking-powder, 1 teaspoonful salt; mix flour, baking-powder and salt together. Cream the butter, add sugar, beat well, then add beaten eggs, flour and milk. Bake 30 minutes in hot oven.

RICE CAKES.—One cup sweet milk, 1 cup warm boiled rice, one-half teaspoonful salt, 2 eggs, yolks and whites beaten separately, 1 tablespoonful melted butter, flour to make a thin batter. Mix in order given.

The Week.

The rains which began just in time to receive a glad greeting in our last issue have continued, not after the manner of fitful April showers, but with frown of sky and sigh of wind which attend a winter rainstorm. The result has been that along the coast, north and south, there has been a good drenching except in some special localities where only a heavy, rainy season really saturates the ground. The Sacramento valley and its tributaries report enough rain for good returns, the east side of the San Joaquin will do well, while on the west side there will be more than was expected two weeks ago. In the upper San Joaquin valley the rain came in time to rescue much grain. In Southern California, some districts will yield a good grain crop and others will make hay and feed grain, which is about all they count on. The trees and vines do not depend upon rainfall, and promise well. There will be a marked reduction in the aggregate grain yield of the State, because the peculiar season led to the decrease of the area sown, and the yield from the sown acreage will be moderate. It is quite possible that improved price may compensate for the reduced weight.

The rain has done a vast good, and as we have half the month left, more water may still be expected. Fruit promises to be very abundant, and, as stated elsewhere, the uncertainty about the disposition of it is all there is to complain of, and even that may work out in a satisfactory manner.

How to Do It.

There seems to be a general desire in California neighborhoods at the present time to go forward in public esteem and to enjoy a share of the sunshine of favor which is now being so generously shed upon our commonwealth. The desire is commendable. If it is acted upon it will accomplish at least two satisfactory results; one in securing the incoming of desirable people to aid in development; another will be the increase of local pride and enterprise which will make every place which cherishes them better fitted to minister to the needs of enlightened life. Possibly there may be many places in which some citizens feel the thrill of the newer life of California, but do not possess the knowledge of how to go to work to crystallize impulses into actions. Such people may, perhaps, take a lesson from recent events in Saratoga, Santa Clara county.

We have received a copy of a very excellent and carefully prepared pamphlet entitled "Saratoga and Its Environs," containing an address delivered before the Saratoga Village Improvement Association, by James E. Gordon. It describes Saratoga and its resources and advantages, and will be read with interest by all who are looking over California with a view to settlement. From Mr. Gordon's pamphlet we learn of the recent organization in Saratoga of two societies; one chiefly esthetic in its aims, the other bristling with business enterprise. Both of these means of advancement are desirable in a town. The society, chiefly esthetic, is named the "Saratoga Village Improvement Association," which has for its objects the following:

To beautify the roads by planting shade trees, sprinkling roads and streets, grading and maintaining roads, planting hedges, encouraging social intercourse by lectures and otherwise, promoting order, tidiness, and generally all means conducing to the health and prosperity of Saratoga and vicinity.

Officers: President, Hon. Milton H. Myrick; vice-presidents, James E. Gordon, Jennie M. Farwell; recording secretary, L. A. Sage; corresponding secretary, Carrie H. Gordon; treasurer, Frank M. Farwell.

Any information regarding Saratoga as a place of residence, its soil, climate, society, cost of living, railroad fare, etc., will be cheerfully answered by addressing the secretary at Saratoga, Santa Clara county, California.

This will improve the town, make it more widely known and minister to its advancement. The other organization, which has "business" for its foundation-stone, is called "The Saratoga Improvement Co.," and is a syndicate having to accomplish the following objects:

To buy unimproved land, plant and cultivate trees and vines thereon, and sell in ten-acre lots on easy terms; to build houses, mills, factories, and supply same with water and gas; construct roads, bridges and sidewalks; to manufacture the products of our fields and forests, and generally to develop the resources of Saratoga.

It seems to us many towns can well do as Saratoga is doing. The county "Boards of Trade" (a name which is, however, peculiar as now applied in this State) are good in the way of uniting for effort on the outside world, but it is quite important that there should be some good internal improvement work done for the benefit of the people and to make more sure the enrapturing of visitors who may come in answer to the county advertising. The example at Saratoga should not go unheeded.

CALIFORNIA ORANGES FOR GERMANY.—Griffin & Skelley, of Riverside, says the *Press*, are packing oranges to send to the World's Exposition at Dresden, Saxony, which will commence May 1st. The oranges sent will be the genuine Washington Navel, and will, no doubt, create a sensation in that country.

THE DROUGHT IN TEXAS has been relieved by copious rainfalls for 300 miles along the T. & P. R. R. and north of that line. In a large portion of that State rain had not fallen for nearly a year, and the suffering has been severe in consequence.

CALIFORNIA has 4000 wine-growers and 160,000 acres in vines, which gives employment to 40,000 people.

Wool and Freights.

The Interstate Commerce law bids fair to work some pretty severe hardships to California unless the Commission can be induced to exercise the prerogative vested in them to make inoperative those provisions which evidently work great hardship to the industry of the country. The general idea of railway regulation is, as we have always claimed, a good one, and one which in the end will prove of great value to the producing interests of the country. If railway managers are effectually taught that the popular interest is a more important consideration than their own aggrandizement, and that their acts must be held subject to regulation in the public interest, there will be a great point gained.

This is, we take it, the main point to be gained, and this is already well-nigh demonstrated even in the few weeks since the law was enacted. It cannot be well for the sake of enforcing this lesson, either to make rates on long hauls so high that producers shall not be able to market their products or to make the roads idle and unprofitable. The Interstate law comes fairly under experimental legislation, and this fact is recognized in the discretionary power vested in the Commission. This power we trust they will exercise wisely and promptly where there is apparent need. It is likely that all the wisdom of the Commission will be called forth in settling the various questions which will arise.

The overland carriage of California produce is certainly a matter which should early claim attention and be adjusted so as not to work great hardship to our producers this season. During this week there has been great activity among our citizens who are interested in handling the wool crop, and on Wednesday it was stated that a petition for relief would be immediately forwarded to the Interstate Commission. It is true that wool is not a perishable product, and the water route via Cape Horn is open at cheap rates; but the reason this does not furnish adequate relief appears from some remarks made by Mr. John H. Wise at a meeting of woolmen held in this city this week. Mr. Wise said:

The operation of the law would affect the wool-growing interest more than every other of the State combined. While California in relation to its fruit products had no competition from any source, and was practically independent on that account, wool, on the contrary, had competition in every State and Territory, and California, being at the extreme, suffered in consequence. The wool trade which heretofore came from Arizona, New Mexico, Utah, Oregon and elsewhere would no longer find a market here, this city being dependent on the tariff which was made for local points.

Should our wool be shipped by water routes, the three months' delay meant loss of the best market for our wool, which is the early one. By the railroad our wool reaches the East in May and June, when that market is bare of wool. If we are compelled to ship by sail, we reach the Eastern market when our wools come in competition with those from the entire country. The speaker had been assured that the railroads were anxious and willing to make a fair rate if permitted to do so. The trade amounted to 40,000,000 pounds per year, and at the present rate of $3.70, over $1,000,000 will have to come directly out of the growers' pockets. The high rates meant no higher prices East, but lower prices to the grower. The railroads had petitioned the commission to suspend Section 4 on imports, but the question of benefit to the people of the State far exceeded in importance that of our foreign trade. He believed a fair statement of the position of the trade on this coast to the Interstate Commission would receive its favorable consideration, and he had the assurance that if Section 4 was suspended—as to wool—the rates would be made fair; and while not as low as prior to April 5th, yet reasonably satisfactory to the trade. He did not believe the intention of the law was to be destructive to any section or to any interest; yet such was the present effect upon California, as far as the wool interests were concerned.

The action proposed was adopted, and a statement, as above, will be sent to the Interstate Commission.

It is quite a mistake, however, to hold, as Mr. Wise seemed to in his speech, that the California fruit interest had no competitors and is therefore independent. Our fruit interest has the keenest competition with the Eastern product and with imported European fruits. It has the added disadvantage of being perishable and therefore wholly unable to take advantage of low rates by water. It is clear that high rates on California fruit will cause the fruit to rot on the trees. It is clear that the prosperity of California demands some action on the part of the Interstate Commission, for a prohibitory freight rate will paralyze our young and promising industries.

VACAVILLE produces the earliest fruit in the State.

The Fruit Crop.

It seems beyond question that we are to have plenty of fruit this year. Some indications would promise a wonderful yield of some fruits, but it is a little early to make figures of immensity. It is safer and better policy to refrain from making over-estimates. In all probability, however, there will be as much fruit as can be profitably disposed of, and it may, perhaps, require some skill and enterprise to get the profit out of it. There is more than ever reason for growers to look about and see that they have proper safety-valves. It is likely that there may be need of more general recourse to drying, and he is wise who lays his plans accordingly. So long as a man is prepared to handle even a part of his crop himself, he is to a degree, at least, independent of bear efforts to put the price of fruit at the very lowest point, which may be expected. We hear that canners are talking very low figures for apricots and peaches. We know of one grower who has a drier in which he can handle 25 tons a day, who makes an offer of $30 per ton to his neighbors for their apricots, providing they cannot sell for more money to others. With a large crop, apricots can be grown with a profit at $30 per ton, and in that neighborhood at least canners must pay that price or the apricots will be dried, and no doubt the owner of the drier will do well by his enterprise. If all neighborhoods were thus situated, it would be well, for we hear of canners' bids as low as $15 per ton, which is a starvation rate to the grower and wealth to the canner. The only safety in the matter of fair prices is for the growers, either singly or by co-operation, to fit up capacious driers or canneries which may be operated or not, according to the market value of the green fruit.

The Interstate Commerce law comes into operation just at a time calculated to bring much uncertainty into the Eastern business. There will be much influence brought to bear at both ends of the line to induce the commission to put a generous construction upon the Act, at least as far as California fruit is concerned. The movement in New York looking to a fostering of the trade in California fruit in the metropolis, is apparently a good indication. An account of this movement may be found upon another page of this issue.

Upon another page may be found the last circular of the Fruit Union. We presume its operations will be somewhat influenced by the Interstate Commerce law. The circular mentions the visit of the president to the East to arrange trade facilities, etc., in the latter part of May. It seems to us that is rather late in the season, but there may be reasons for it. The situation is not altogether clear. The injection of the new elements of uncertainty has not improved it. Possibly, however, something more definite and encouraging may be soon announced.

The Vote on the Amendments.

The returns from the voting on the proposed Amendments to the Constitution are coming in slowly, but it appears, from the figures received up to the time of our going to press on Wednesday evening, that Amendments Nos. 1 and 2 are defeated by the manifest opposition to them in the interior.

Our farmers, who have been outspoken in their opposition to these measures, can congratulate themselves upon this result, which must be in a large measure due to their voices and votes. These amendments, it will be remembered, were intended to reorganize the Supreme Court and take the election of the Chief Justice from the people; also to increase judicial salaries. The people of the State have by this election declared themselves against such action. The fate of Amendment No. 3, which related to the charters of the lesser cities, is still in doubt. If it is lost it will probably be because it was caught in bad company.

This experience may also be taken as a rebuke to those who attempted to forestall public opinion and railroad these measures through by a special election, instead of allowing them to come up at a regular election—thus inflicting a vast and unnecessary expense upon the people. In this enlightened day it is becoming more certain that a sharp trick is apt to be dismembered by its own acumen, and that the plain, honest way is the best way after all.

An Upland Loco-Weed.

In the Rural of Oct. 30, 1886, we gave an engraving and description of a loco-weed occurring in Colorado and New Mexico, botanically known as *Astragalus mollissimus*. Upon this page may be seen another loco plant more common than the preceding and found in abundance on the high plains and in the mountain ranges from British America to Mexico. Its botanical name is *Oxytropis Lamberti*. Although the titles are apparently quite different, the plants are really closely related. Dr. Asa Gray, writing of the two plants named in the *American Agriculturist* some years ago, said:

All the plants sent for identification and said to cause loco poisoning have been of the Leguminous and of the Astragalus tribe. The species to which this damage is attributed in the plains of Colorado proves to be the *Astragalus mollissimus* of Torrey—a very downy species, as its name indicates. We never found this species on the mountains. But there the same ill effects are charged upon plants of similar appearance, belonging to a nearly related genus, *Oxytropis* mainly to *O. Lamberti*, which abounds at all elevations up to 8000 or 9000 feet. The botanical difference between these plants is so little that they might all be counted as species of *Astragalus*, but there is reason to think that this particular *Astragalus* of the plains of Southern Colorado is much the most dangerous. For this species is not found as far north as Wyoming and Nebraska, where the *Oxytropis* abounds on the plains; and there we never heard of this trouble.

These plants are all of the legumes or pea family, and the fact of their injurious character gave Dr. Gray occasion to write this very interesting history of the pea family:

There was a prevalent notion that plants of the pea tribe (*Papilionaceous* plants) generally are innocent, if not wholesome. No one suspected a tribe which gave us peas, beans, lentils and the ubiquitous peanut, and supplies such fodder as does clover, medick, lucern, vetch and cow-pea. In the first edition of his "Natural System," Lindley wrote: "The general character of this tribe is its nutritious, or, at least, wholesome, properties." Later, the note is changed, and in the "Vegetable Kingdom" he declares of the order "that, upon the whole, it must be considered poisonous, and that those species which are used for food by man or animals are exceptions to the general rule, the deleterious juices not being in such instances sufficiently concentrated to prove injurious." What a pity that our cattle are not better acquainted with the corrected rule! In Europe and in the Atlantic States no harm is known to come to cattle from want of proper discrimination. But when European flocks were taken to Australia, and to pasture and forage almost wholly new, thousands of sheep perished in the Swan River colony in consequence of cropping the leaves of some leguminous plants to which they were attracted. What made the matter worse for the botanists was that the very plants which did the mischief had been recommended by one of them (Mr. Preiss, a German) as the best thing the agricultural society could cultivate as artificial food for stock. But another botanist, Drummond, a canny Scotchman, got up some experiments and proved that the people were right in charging the damage to these very species (of *Gastrolobium*) which the German botanists on general principles expected to be innocent and useful. The same plants are fatal to goats and even to cows and horses. The symptoms, as described, are almost exactly like those produced by the loco-weed. In other parts of Australia, species of a different genus (*Swainsonia*), very like *Astragalus*, and like the bladder senna (*Colutea*), destroy cattle in the same way.

It is recorded that the poison plants of Australia were found on analysis to contain a poisonous alkaloid, apparently *Cytisin*, to which the injurious properties are attributed. It was thought chemical analysis might show something similar in our loco plants, but so far the analyses made do not disclose it. The plant shown in the engraving, *Oxytropis Lambertii*, grows in strongly-rooted clumps, has an erect habit. The leaflets are about one inch long by one-fourth to one-third inch wide, and are hairy, especially upon the upper surface. The flower stalks (says Dr. George Vasey in his description) proceed from the root stock and are usually 9 to 12 inches long, and naked except near the top, which has a rather close and thick cluster of flowers, much like those of the *Astragalus* in general appearance, but differing in some minute characters which separate it into another genus, and are succeeded by erect lance-oblong, pointed pods of about an inch in length. The flowers are subject to much variation in color, some varieties being purple, some yellow and others white.

The Pacific Kennel Club, at their last monthly meeting, decided to hold a bench show in this city on the 1st, 2d, and 3d of September.

Dried Fruit From Los Gatos.—On Friday of last week Mr. A. N. Van Fleet, our reader and correspondent at Los Gatos, showed us a sample case of evaporated fruit, put up by himself and his partner, Alex. Hildebrandt, the beauty of which is seldom surpassed. The case, about 15 inches square, was divided into eight compartments, radiating from the center, and containing, under glass, elegant specimens of French prunes (running 40 or 45 to the pound), Oregon silver prunes (about 18 to the pound), Muscat raisins, Crawford peaches, both peeled and unpeeled, and Blenheim and Large Early apricots. The fruit, as a whole, was singularly handsome, especially the silver prunes, and a carved border of oak leaves and acorns set off the exhibit very tastefully. Mr. Van Fleet reports the outlook for the fruit crop excellent in all parts of Santa Clara county.

A LOCO PLANT—Oxytropis Lambertii.

Counterfeit Silver Afloat.—Counterfeit dollars, halves and quarters, dated 1886, have been largely circulated in Fresno recently. The coins are said to be well executed and calculated to deceive, but are wanting in weight and ring, and can be detected by close scrutiny. The public are warned to be careful in examining their change, as the spurious coin has a new, bright look about it, and the date is liable to throw one off his guard. The "shovers of the queer" have been at work for some time in Los Angeles, and it behooves people in all parts of the State to be vigilant.

Ginseng Culture.—The Visalia *Times* suggests that growing ginseng, for export to China, would be likely to prove a lucrative business in some parts of the State. The Celestials use the root, dried, for medicinal purposes as well as for a preserve, and the Chinaman in this country is poor indeed who has not always a jar in his cabin. The *Times* is confident that the plant could be profitably cultivated in that portion of Tulare county immediately east of Visalia and also on the bottom-lands of Kings river and other streams, and that a ready market would be found in San Francisco.

Equine Surgery.—An Eastern dispatch reports a case of veterinary surgery which is said to be the first of its kind on record in the United States. A valuable brood mare on the stock farm of Norman Barnard, near Avondale, Penn., lately broke her leg, which was set by Dr. Ewing and left in good condition. But the limb was afterward broken again, by the animal's plunges, and Dr. Huedikosen, of the University of Penn., advised that it be amputated. The operation was performed, and the mare is said to be doing well.

Wheat and Alkali.

We notice that the Chicago *Tribune* in its issue of April 7th is hugging the idea that California wheat-growing is likely to die out because of outcropping of alkali, and that this will ere long remove our fields from competition in the wheat supply of the world. The same fate is to overtake the wheat industry of India, and therefore the Mississippi valley will be left the pleasure and profit of wheat-growing. There is alkali in California and India, and there is danger of its increase by irrigation if precautions are not taken against it. So far as California is concerned we anticipate that the drainage remedy will cope with the evil, for drainage systems must be had for this and for other reasons, and there is now a very hopeful disposition among the people in regard to it. The prominence given to the alkali extension in the excellent special report by Prof. Hilgard is not in anticipation of the result which the Chicago *Tribune* joys to foresee, but merely to inform people of the proper remedy and the need of applying it.

The production of wheat in California is but a very small measure from irrigated land. In the main it is from land moistened only by the natural rainfall. The irrigated area is increasing, it is true, but there is no likelihood of its supplanting rainfall in parts where rainfall gives good crops most years. Hence the downfall of wheat-growing is not to be expected. Our wheat product may decrease, and so long as the margin of profit on wheat is so small as at present, the decrease is not to be regretted. The reason why it is not to be regretted is that wheat decreases because other more profitable uses are found for the land. Irrigation water, as a rule, brings in another class of products, including fruit, alfalfa, and other crops for live-stock, etc., which produce more value from less area, give more and steady work for a laboring class, fill up the country with homes, villages, towns, cities, support manufacturing enterprises, and otherwise contribute to the full development of the country. When California land becomes too valuable to grow wheat on, then the Chicago *Tribune* can have the wheat industry for the Mississippi valley. The wheat industry has done much for California, and we shall cling to it as long as it serves us well. When we let it go, which is not likely to occur, it is because all the land is needed for other uses. If we do stop it will be not because the soil has become worthless, but because it has become too valuable. Let the *Tribune* note this fact.

Big Schemes and efforts to monopolize the various limited branches of business continue to be the order of the day. The consumption of sulphuric acid in the manufacture of petroleum is about 4500 tons per month. This affords a fine opportunity for the Standard Oil Company to step in and monopolize the manufacture of that commodity, which they are now making efforts to do. In addition to the demand for this acid for petroleum manufacture, it is also largely used by tanners, nitro-glycerine manufacturers, and for galvanizing anything made of iron, in brass works, for fertilizers and other minor industries. Another big scheme has been set on foot by Armour & Co., the well-known pork-packers of Chicago, who propose to control the manufacture of cotton-seed oil. It is said that 20 mills are in contemplation, for which sites are being chosen. According to report, eight will be built this year, each of which will have machinery costing $80,000, and 64 cotton presses will be ordered. The oil is said to be used as an adulteration of lard and other hog products. Doubt is expressed respecting the advantage to be realized from the sale of seed for oil rather than retaining it for fertilizing purposes, where the land is impoverished. By some, however, it is said that Armour's scheme is simply a bluff game, played by the big packer against the managers of the American Cotton Oil Trusts.

Mr. Geo. B. Green, of Courtland, who is engaged in raising apricots and peaches on the upper end of Randall's island, dropped into our office a few days since and renewed his subscription to the Rural Press. Mr. Green has been making a series of experiments with insecticide washes, the satisfactory results of which he means to bring before the public. He speaks very hopefully of orchard prospects this season along the lower Sacramento.

PUBLIC AFFAIRS.

Is It Well Spent?

EDITORS PRESS:—In a paper published in the interest of the liquor traffic I find the following statement, in reply to the common charge made by temperance people, that this nation spends annually $900,000,000 for strong drink. The writer says: "We will make a few statistical calculations for the purpose of showing these clever figurists that this money is well and economically expended and does more toward building up our social fabric, lubricating the machinery of Government—general and municipal—sustaining the body politic, as well as the social maintenance of the population, and employing a larger amount of capital than perhaps any other interest except agriculture and railroads. Thus, out of this $900,000,000 which it is claimed is wasted in intoxicating drinks, the United States is assisted to the tune of nearly $100,000,000 annually, this being derived from customs, revenue taxes and special licenses, which require the services of about 50,000 revenue officers, gaugers, etc., to look after these interests of the trade for Uncle Sam." Then, after giving the number of men employed in each department of the liquor business, the writer adds: "Thus we have shown that there are employed, fed and clothed, in connection with this trade, at least 1,200,000 people."

Let us now examine these arguments. He says it builds up our social fabric. But when we see the general effect of intoxicants upon men's social faculties, when we see convivial gatherings break up in drunken rows, and, above all, when we look to that most important part of our "social fabric," the family circle, and see the blight and desolation caused there by drink, we are ready to ask this writer if *that* is what he calls "building up our social fabric."

He says it lubricates the machinery of government. Yes! and our courts, prisons, almshouses and insane asylums are filled with the drippings of this whisky lubrication.

"Sustains the body politic." It does seem to, much as grog sustains a tippler. Our "body politic" is much "under the influence of liquor." Its legislative action shows it, and it gets "pretty full" on election days. Candidates carry a bottle and are said to run the better for it. Voters vote oftener and easier when inspired by candidate-whisky. Officers go to their office-work under its baptismal obligations. It is very "sustaining"—very.

And there is the revenue. Of the $900,000,000 annually spent for drink, $100,000,000 (minus salary of 50,000 officers) goes for revenue. But since most of this is gathered from laborers and withheld from other and useful purposes, can any one tell how much its value is increased by passing from other use into the liquor business, or how much more the money is worth to the nation, when passed into the treasury as whisky-revenue, than it was in the hands it was taken from? It was the people's money, individually, before, and is the people's money collectively, afterward, and is equally a part of the nation's wealth in either place; so where is the gain?

But it is suggested that it relieves from taxation. Yes! the revenue thus gathered relieves capitalists from taxation, and laborers from having anything to tax—a double relief, of course!

It gives "employment" to 1,200,000 people, and an immense capital. That sounds well, but it should be remembered that employment may be useful or harmful, according to its results. Agricultural labor produces value in grain. Mechanical labor, as in building houses and ships, constructing railroads, machinery, and implements, produces therein value that did not before exist; and whatever withdraws labor or capital from useful occupation, or uses it harmfully, depletes the product wealth of the nation.

There is destructive employment as really as productive. The great Rebellion gave employment to many men, and much money, but its instigators are not regarded as benefactors. It killed many men and destroyed much property. But statistics show that the nation's drink has killed more than all its wars, beside the many it has crippled and not killed. General Scott once said that one wounded soldier made more trouble than three dead ones, and certainly one living drunkard makes more trouble than six dead ones. The latter make no expense for police force, criminal prosecutions or pauper support, while for the former the bills are enormous. When whisky disables a laborer, it lessens national wealth to the amount of value of his labor time. Competent authority has made the following estimate of this depletion of the nation's resources:

Idle time of tipplers	$296,849,592
Idle time from insanity caused by drink	49,129,500
Idle time from idiocy caused by drink	159,954,000
Labor time cut short by premature death from drink	612,500,000
Total	$1,118,433,092

If withholding the labor of 1,200,000 men and an immense capital from other useful occupation to put into such results, is not a national loss, what *should* it be called? If it *is* so, then at $1 per day for 300 days in the year, the loss for that time, not reckoning the capital, would amount to over $1,478,000,000 annually. Leaving out of this reckoning the court, prison and hospital expenses of the traffic, is not that rather an expensive way of transferring the comparatively small amount of revenue from the people's pockets to the people's treasury? Is it not about time that the liquor revenue plea and the liquor employment plea were abandoned? and really, is it not time the whole business was abandoned?

Of course, many important considerations have been overlooked in this estimate. The writer referred to neglected one which we might notice. In numbering the persons connected with the traffic, he left out the drunkards. They are numerous, and are the chief support of the business. They do more toward the aforesaid "building up our social fabric, lubricating the machinery of government," etc., than any other class. But their service shortens life; so that out of 100,000, 6000 annually hasten to drunkards' graves, and the world hastens to forget them. THOUGHTOGRAPH.

Paskenta, April 2, 1887.

THE FIELD.

The Government Crop Report.

WASHINGTON, April 9.—The report of the Department of Agriculture for April relates to the condition of winter grain and the comparative healthfulness of farm animals. The returns show that the condition of the soil at the time of seeding was somewhat unfavorable in the States on the Atlantic and Gulf coasts, owing to the drought during the late summer and autumn months, which was severe. In portions of Pennsylvania, in Maryland and Virginia and parts of Texas the same unfavorable conditions prevailed. In Western Missouri and in Kansas the continued dry weather made plowing difficult and seeding late, and in localities where the soil was broken when winter set in, germination was slow and the fall growth small. In the great wheat States of the central belt, from Tennessee to Missouri, seeding was late, but the greater part of the area was in favorable condition, and with local exceptions, the plant made good growth before going into winter quarters. The covering of snow during the early portion of the winter was better than usual over a large part of the wheat area, but there are from many sections complaints of scanty protection during the very trying weather since Feb. 15th. The month of March was the most severe for a series of years, the temperature being below the average over the whole wheat area of the Mississippi river, and the alternate freezing and thawing brought serious damage to the bare fields, especially in the bottom and poorly drained lands. Pennsylvania, Virginia and Ohio suffered severely from this inclemency. The general average of the condition is .88, the same as in 1881, and higher than at the same time in 1883 and 1885, when it was .80 and .76 respectively. The April condition of last year was 92.5, which was still further improved by the favorable weather during the month.

The average for California is .92; Oregon, .98. The damage from the Hessian fly is comparatively unnoticed; its presence is mentioned in from one to four counties in New York, Texas, Tennessee, Ohio, Pennsylvania and Michigan. Rye has withstood unfavorable meteorological conditions better than wheat, the average condition being .92 against .92 at the same date one year ago.

The returns of the condition of farm animals show a loss of swine amounting to 13.4 per cent, or 5,500,000, and indications are continued of the widespread prevalence of hog cholera. The losses of sheep amount to 7 per cent; of cattle, 4.3 per cent. The losses of cattle are heaviest in the South, and on the ranges in the far West from 5 to 9 per cent, while in sections where shelter is provided and better care taken, it amounts to only 2½ to 3 per cent.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.
GEO. MCDOWELL—Tulare Co.
T. P. POWERS—Napa and Sonoma Cos.

A SCOTCH COLLIE.—We have received from D. Z. Evans, Jr., dealer in thoroughbred live-stock, at Germantown, Pa., a photograph of a drawing of an imported Scotch collie, "Rob Roy"—a nice-looking specimen of that valued breed.

NO MORE SNUFFING, HAWKING, OFFENSIVE BREATH--NO MORE CATARRH!

CALIFORNIANS

WANT

CALIFORNIA TESTIMONIALS

AND NONE OTHER!

When they pay money for a prescription they demand some assurance of a good result. No prescriber warrants. Our National Disease has been neglected and allowed to run its course, because, heretofore, there has been no guaranteed cure. Years of patient toil and research have brought forth the **Only Absolute Cure for Catarrh, Neuralgia, Nervous Headaches, Catarrhal Deafness, Sore Throat, Inflamed Tonsils, Bronchitis, Granulated Lids, Weakness of the Optic Nerve, Diphtheria** and **Quinsy.** We have proved that the "CARBOLIC SMOKE BALL" and the "DEBELLATOR" will cure, by the numerous Home Testimonials published, and which we will be pleased to send to any address.

THE PEOPLE

ARE DONE WITH EXPERIMENTING!

WORTHY THE SCULPTOR'S CHISEL!

THE WORDS OF PRAISE!

THE LETTERS OF COMMENDATION

Received from those who have Tested the Merits of the

CARBOLIC SMOKE BALL!

WE WARRANT OUR CLAIMS!

(Which are constantly being verified by Home Evidence.)

Catarrh—Cured in from three to six months; warranted.
Asthma—Cured in nearly every case; always quickly relieved.
Bronchitis—Cured in every case; warranted.
Hay Fever—A cure guaranteed when taken in time.
Catarrhal Deafness—Cured in from three to six months.
Eyes—Granulated lids, weakness of the optic nerves, etc., cured within two months.
Neuralgia and Headache—Stopped after the third application.
Diseases of Children—Whooping cough cured; croup relieved in five minutes and cured within two days.
Throat Troubles—Quinsy quickly relieved and thoroughly cured, as are inflamed tonsils and ulcerated sore throat.
Snoring—Three doses each night before retiring cures this trouble.
Colds—In the head, cured by a few applications; fresh colds on the chest, in 12 hours.

THE COMPLETE TREATMENT includes the "Debellator" package, unequaled as a blood purifier, which must be used in Catarrh when there is a dropping of mucus into the throat, biliousness, or where the bowels are irregular or there are stomach or kidney disorders. It should be used in all cases of Catarrh, Asthma, Bronchitis, Hay Fever and Ulcerated Sore Throat. Price of the complete treatment, $5; "Smoke Ball," $3; "Debellator" package, $2. One complete treatment is generally sufficient.

MAIL ORDERS receive careful and prompt attention. State disease or symptoms in writing, addressing MAIN OFFICE. Complete treatment mailed on receipt of price, $5, and four cents in stamps. "Smoke Ball," $3 (four cents in stamps). "Debellator" packages, $2.

"CARBOLIC SMOKE BALL" CO., 652 Market St. {Cor. Kearny, Rooms 7, 8, 9, 10} San Francisco.

Scale-Bug Exterminator & Preventive

The only Sure Death to the OYSTER-SHELL SCALE or SAN JOSE SCALE.

EXTRACTS FROM LETTERS:

Courtland, March 28, 1887.

Mr. Chas. J. Woodbury, San Francisco—Dear Sir: It has given better satisfaction than any other wash I have used, as it has destroyed the San Jose and Black Scale, which all other washes used by me failed to do. It has also been a benefit to the trees as a fertilizer, and I regard it as being by far the best insecticide on the market. T. W. Dean.

Courtland, March 28, 1887.

Mr. Chas. J. Woodbury, San Francisco—Dear Sir: From my experience with your tree wash, during the past season, I have no hesitation in saying that I believe it to be the best in the market. I have succeeded in destroying the San Jose Scale, which infested my orchard, and which all other washes I have used had failed to kill. Parties wishing to inquire further in regard to my experience with it, can do so by writing to me. Geo. B. Greene.

Walnut Grove, Cal., March 23, 1887.

C. J. Woodbury, San Francisco—Dear Sir: During the past winter I have used the Scale-bug Wash which you are making, and find, when properly applied, it does effective work in killing the scale and has not injured the fruit buds on either peach, plum or pear trees where I have used it. Yours respectfully,

A. T. J. Reynolds.

Walnut Grove, March 20, 1887.

Charles J. Woodbury—Dear Sir: It does the best work on the San Jose Scale of anything yet, and in fact it is the only wash that will kill them, and is sure death to all other scale and insects, such as Red Spider, Peach moth and Codlin moth, if used in the early part of the summer. Yours respectfully,

L. D. Greene.

Courtland, March 28, 1887.

Mr. Chas. J. Woodbury, San Francisco—Dear Sir: The Scale Wash you are manufacturing I have used the past season and find it satisfactory in every way, and I shall continue its use. Yours truly,

Dwight Hollister.

Grand Island, Sacramento Co., March 22, 1887.

Mr. Chas. J. Woodbury, San Francisco—Dear Sir: We take great pleasure in informing you that we have used your wash the last year, and it has done the best work of any, and we have tried nearly every wash. Our orchard is here to stand as proof, and we honestly recommend it to all fruit growers. We are, respectfully,

Messrs. Figg & Green.

Tyler Island, Sacramento Co., March 22, 1887.

Mr. C. J. Woodbury—Dear Sir: I have quite a large orchard of mostly peach, pear and plum trees, all of which were infested with the San Jose Scale. I had heard of the efficacy of the wash as compounded by you, so I tried it, and I now wish to say to you that I consider it *superior* to any wash ever used on this River Section. It is cheap, kills the San Jose Scale *sure*, and does not in the least injure the trees or fruit buds, even if applied two or three times in one season. I finished spraying March 31. Yours truly, Jno. Miller.

Courtland, March 22, 1887.

Mr. Chas. J. Woodbury, San Francisco—Dear Sir: It not only destroys the scale, but also the moth, and leaves the bark of the tree in a healthy state. I am, yours respectfully,

Joseph Green.

Try a Sample of WOODBURY'S SCALE-BUG EXTERMINATOR AND PREVENTIVE.

FACTS:

First—This is the only preparation which destroys the San Jose Scale or Cottony-Cushion Scale. Any number of mixtures are advertised which profess to destroy the ordinary small insect pests, and which are more or less efficacious against all such as are not protected like the Armored Scale. If the testimonials published in regard to these mixtures are carefully examined, or if the actual work of any of them is thoroughly tested, it will be seen that they have no power whatever against any of the insects which are thus protected. *They cannot penetrate the scale.*

Ours is the only wash that literally consumes, both in larvæ and after development, the Blight Worm, Codlin Moth, Peach Moth, Cottony-Cushion Scale, Woolly Aphis, Red Spider, Black and Oyster Shell Scale. Also, after cleansing, it protects the tree from the formation of young scale. A preparation which would accomplish this at almost any cost would be a boon to the fruit-grower.

But when we mention the second great consideration in favor of this preparation, namely, that it costs only about two cents per gallon, whereas the cheapest washes that have attempted the same work cost six cents, any reason for not trying it should disappear. The actual cost of spraying an ordinary tree with this wash is not more than six to ten cents. One spraying does each year. We guarantee that our wash literally consumes the pest without injury to the tree. Full directions on each package.

Price 3½ cents per Pound by the Case.

Two 40-pound Cans in Case. 10 per cent Discount by the Barrel, 400 lbs.

This is the cheapest possible wash. It is effectual; does what we claim for it. It retains its strength; most other washes when exposed crystallize, become a carbonate. Then their strength is gone. We give full directions, both for the summer and winter wash. They are easy to follow, so that it is impossible for the fruit grower to in any way injure the tenderest shrub or tree, or fail to remove the insect or bug, either mature or in the germ. All trees washed with this preparation will show a more thrifty growth and better general appearance.

Try it and you will find it is the solution of the scale-bug question. Address,

CHARLES J. WOODBURY,

THE WASTE OF WOOD.—It has been estimated by competent persons that, comparing the dead weight of a tree as it stands in the forest with the dead weight of the lumber that is obtained therefrom, not more than 25 per cent is actually delivered in the timber market. The remainder consists of limbs and slabs, roots and edgings, and buttings and waste in general, in the forest and at the sawmill. However extravagant and wasteful the timber trade may have been in time past, it may now be noted with satisfaction that, owing to the increased demand in various directions for these so-called waste products, it is likely that the proportion utilized will be reversed, and the loss not exceed 25 per cent, even if it reaches that amount. This is especially due to the growing uses for wood pulp, which now enters not only into the manufacture of paper—in itself a vast industry—but also finds employment in many other directions of almost equal magnitude.

THE SETTLER WAS AHEAD.—On the 9th inst. Acting Sec. Muldrow of the Interior Dep't affirmed the adverse decision of the Commissioner of the General Land Office in the case of Robert Elwell vs. the N. P. R. R. Co. claiming a certain eighth section in Walla Walla, W. T. The appeal was made by the company respecting an application to surrender a patent for amendment. The railroad company claimed the land under a withdrawal from the public domain that had been made for its benefit, but the decision is that Elwell had a prior claim to it by reason of prior settlement and continuous occupation and cultivation of the tract.

CAN'T "MAKE THE BUSINESS RESPECTABLE."—A number of saloon-keepers appeared before the Tulare Supervisors, April 6th, asking for the abrogation of that portion of the liquor-license ordinance which requires a bond in the sum of $2000 as a guarantee for keeping an orderly house. They claimed that it would be impossible for the great majority of saloon-men to secure the bond—though they could easily secure the requisite signatures of 10 freeholders.

PEACHES IN JERSEY.—At a recent meeting of the horticulturists of Hunterdon and Warren counties, N. J., it was generally admitted that the fruit crop, especially of peaches, promises to be uncommonly large—perhaps the heaviest for years.

Something New

And most important. Hallett & Co., Portland, Maine, can furnish you work that you can do at great profit and live at home, wherever you are located. Either sex; all ages. Asa P. Rand, Westboro, Mass., writes us that he made $60 profit in a single day. Every worker can make from $5 t $25 and upward per day. All is new. Capital not required; you are started free. Full particulars free. Send your address at once.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER

Agent for sale of all kinds of Country Property.

Choice Homes in Contra Costa.

Improved Places for Sale near Walnut Creek.

One lot of 11 acres, with house of six rooms; pantry, milk-room and summer kitchen, in good repair; barn, chicken-house, etc., and fine orchard of various fruits. Situated within 1½ miles of the village of Walnut Creek, this offers an almost ideal home to those desiring a sheltered spot in an almost perfect climate. Price, $2000.

Also, 12 acres close by the same village, half set to Zinfandel grape-vines, just coming into bearing, with four-room house—hard-finished and nearly new—stable, etc. Price, $2300. Wells of excellent water on both places.

For further information, address
H. F., Box 2361, S. F.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. 20,000 acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION, 401 California St., San Francisco.

The Fruit-Growers' Convention at Riverside.

As we go to press the Fruit-Growers' Convention and Citrus Fair are in progress at Riverside. The RURAL PRESS has a special representative present, to whose letters we shall trust for a full account of the proceedings in future issues. The following accounts of the meetings come by telegraph:

First Day.

RIVERSIDE, April 11.—The Fruit-Growers' Convention met here this afternoon. It was opened with an address by the president of the State Board of Horticulture, Ellwood Cooper of Santa Barbara, who reviewed the work of the convention from the date of its organization to the present time. He referred to the failure of needed legislation by the late Legislature and the failure of the Appropriation bill for the State Printing Office, which crippled its resources to such an extent that the proceedings of the last two State conventions could not at present be published. He was followed by H. J. Rudisill, who delivered an address of welcome on behalf of the citizens of Riverside.

The convention was then fully organized by the election of S. C. Evans and L. M. Holt as vice-presidents and B. M. LeLong of Los Angeles as assistant secretary. Elwood Cooper was ex-officio president of the convention and J. Chester of San Francisco was secretary. E. W. Holmes and H. J. Rudisill of Riverside and I. A. Wilcox of Santa Clara were appointed a Committee on Program.

A very able paper on Japanese fruits, by Mrs. H. H. Berger of San Francisco, was read and discussed at length.

Prof. C. V. Riley, United States entomologist, is here, and will address the convention to-morrow on the subject of insect pests. To-day Professor Riley has taken a trip through Riverside, and wonders at the clearness of the trees and freedom that our orchards enjoy from all kinds of insect life. He urges strong quarantine regulations to keep out the pests which threaten so much destruction in other parts of the State.

The convention was held to-day in the Baptist church, in order to give the people time to arrange the fruit exhibits in the pavilion, and the day has been thoroughly occupied by placing in shape one of the finest exhibits of citrus fruits ever seen in this State. The space is limited, as only one-half of the pavilion could be used by the exhibit, while the other half is seated to accommodate an audience of 500 people. The exhibit covers five long tables. The center table is occupied by Griffin & Skelly, fruit packers. This firm has purchased the bulk of the Riverside crop, and have on their table some of the finest fruit to be found in the valley. It is due to the energies of this firm that the price of Riverside oranges rallied from the first scare and gradually advanced until they are quoted in Chicago at from $4 to $7 a box, and they are now reaping the reward of their energy and pluck.

The Interocean Cold Storage Company has a fine exhibition of oranges and lemons that were kept in cold storage for 48 days, then removed two weeks ago and repacked, at which time every sample was in a perfect state of preservation, and to-day they were sampled and found to be perfect in every respect, thus proving the proposition that fruit will keep after being taken out of cold storage.

The Colton Marble Company has on exhibition a fine collection of marble samples and onyx taken from Slaver mountain, seven miles north of Riverside. The onyx is worth in the rough $35 per cubic foot in the New York market.

Second Day.

RIVERSIDE, April 12.—The attendance at the State Fruit-Growers' Convention was increased to-day and much interest was manifested. Professor C. V. Riley delivered a very able address on insect pests, which was listened to with marked attention and was followed by a very interesting discussion. W. G. Klee, State Pest Inspector, also delivered an able paper on the same subject. Professor Riley urged the use of kerosene emulsion spray for the extermination of the cottony cushion scale by means of a cyclone nozzle. The question of interstate commerce will be discussed to-morrow.

HEREFORDS.—Readers who have noticed the mention we have made from time to time of the Hereford cattle from the herd of James Kay, the famous English breeder, will be interested in an advertisement on page 346 of this issue, showing that the cattle are to be sold at auction by Killip & Co., at the agricultural fair grounds in Sacramento, on Wednesday, April 27th. The Herefords are becoming very popular on this coast as beef cattle, and the sale should draw a crowd.

ONE branch of useful industry upon this coast likely to profit largely by the Interstate Commerce Act, is the manufacture of breakfast cereals. Having the raw material close at hand, the work of preparation need not be loaded with the extra cost of transcontinental freighting.

PLEURO-PNEUMONIA IN ARKANSAS.—In response to a telegram from the Governor of that State, the Commissioner of Agriculture has ordered an inspector to proceed to Arkansas and examine some herds of cattle which are thought to have pleuro-pneumonia.

Stockton Notes.

[Written for the RURAL PRESS by MRS. W. D. A.]

Farmers' faces have shortened one-half, and shine with satisfaction at the fine rain, just in time to save the crops which in some places began to show checked growth and curl of blade. The six weeks' spell was broken the night of the 6th by a shower; but a north wind cleared the sky and hope sank till the 8th, when the moon fulled and a rain of more than an inch poured down, with an hour's high wind, that twisted large limbs and tops from the big full-leaved oaks, and scattered buds and boughs from the orchards. Flashes of lightning brightened things also.

The night of the 7th was brilliant with moon and stars, and with the star tragedian, Edwin Booth, at the new theater, whose nerve and quiet power, intensified by years of study, charmed the full audience. Messrs. Southworth and Humphreys, owners of the theater, deserve thanks for getting the greatest of living actors here.

Friday night 12 wheat-buyers came from San Francisco, and after the big rain on Saturday, drove in three hacks to look at the crop prospect between here and Lodi, along the good gravel road. Some offer to buy the growing crop at $1.75—the farmer taking the risk of no crop. There is little doubt of the yield being fair now. True, hot showers in June might rust it somewhat and blizzards on sandy soil blow the roots bare.

The Shippee Harvester Co. has made 125 of the unrivaled Houser machines, 100 of which were conditionally sold; but this rain assures two-thirds of a crop, at least, and the sale of all the machines.

The rain is timely for the vineyards and orchards, set all over the county this season, in from a half acre to 60 acres. Many cuttings are being sprouted, too. A farmer near Lodi set 1500 nut trees; another, two years ago had nearly a ton of almonds from 150 trees. Last year red spiders injured the crop; early spraying destroys most of them. Eastern people are buying small tracts and making homes thereon, and will raise grapes and fruit, and, in time, increase the pupils in our small but excellent country schools.

A grand picnic will come off April 23d at Good Water grove (donated), given by the G. A. R., Pioneers, Grangers, and Ladies' Relief Corps. We hope that every one will turn out, as a fine oration, music, recitations and games will repay the lovers of fun and aid a worthy object. We ought not to be left to monopolize all the honors to the humane Gridley, for he is the hero of Nevada and our whole State and coast.

Stockton, April 12, 1887.

Yolo County Items.

EDITORS PRESS:—I can report flattering prospects in this part of the Sacramento valley, as we have received the early and the latter rain, and now, with the heavy dews that usually come from this time on, I think the crop is assured, even without more rain; but it is still showery, and the weather is by no means settled. The grain is looking finely—could hardly be better.

The dry weather during the greater part of March enabled the owners of orchards and vineyards to put their ground in good condition and to eradicate the winter growth of weeds. Strawberries are beginning to ripen and promise an unusually heavy yield. Peaches are not heavily loaded, but pretty well distributed on the trees and will be large. Apricots will have to be thinned to keep the trees from breaking down, especially the Moorparks. The new Peach is nearly the same. It seems that the Moorpark is trying to redeem its lost, or failing, reputation as a good bearer this year, and now if that embargo on freight East can be raised, I see nothing in the fruit-growers' horizon to prevent his realizing something this year to compensate him for the time, labor and brains he has put into the business.

A Board of Trade was organized in Woodland last Saturday night for the purpose of letting our advantages be known to the home-seeker from the other side of the Rockies. Land here is being divided into small parcels for persons of small means—5, 10, 15 and 20-acre lots—at $100 per acre; and better land for fruit, especially the raisin grape, the sun does not shine on in California.

We tried planting the whole potato last year and got more potatoes per acre; also more small ones and more large, overgrown ones, composed of many in one. The eye in the piece gives a better average size and more marketable; and beside, this year, owing to the price of seed, it is more economical. If seed is low and land scarce, plant whole ones; if the reverse is true, then cut according to cloth is our motto More anon. J. B. SPRINGER.

Woodland, April 11, 1887.

A NEW PACKING FOR FRUIT.—There has long been a call for some material, cheap and abundant, which will answer as well as cork-dust to pack fruit in. It appears, by the Auburn *Republican*, that T. S. Fitch, of Lincoln, has found the article desired in ground corn-cobs. The material is as light as cork-dust and imparts no smell nor flavor to the fruit. Mr. Fitch has applied for a patent on his discovery.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

"Said Aaron to Moses,
Let's cut off our noses."

Aaron must have been a sufferer from catarrh. The desperation which catarrh produces is often sufficient to make people say and do many rash things and many continue suffering just as if no such cure as Dr. Sage's Catarrh Remedy existed. It cures every case from the simplest to the most complicated, and all the consequences of catarrh. A person once cured by Dr. Sage's Catarrh Remedy will not be apt to take cold again, as it leaves the mucous membranes healthy and strong. By druggists.

"I Don't Know What Ails Me."

Says many a sufferer. "I have the 'blues' frightfully; I am troubled with headache and dizziness; I have lost my appetite, there is a bad taste in my mouth constantly. What is the matter with me?" We will tell you; you are "bilious." Get a bottle of Dr. Pierce's "Golden Medical Discovery," use it faithfully, and you will soon be a new man again. All druggists have it.

Use the surest remedy for catarrh—Dr. Sage's.

A Perfect Tree Wash for Summer.

In response to inquiries, too many to answer by mail, I wish to assure all interested that my SCALE-BUG EXTERMINATOR is unequivocally *guaranteed* to be *perfectly harmless to the tenderest tree or shrub.* You can use it with perfect confidence when your trees are in full foliage and the fruit set. There has never been a single instance of the slightest injury from it. The trees come out from it as from a healthful bath. See advertisement in another column. Address, CHARLES J. WOODBURY, 123 California St., San Francisco.

A GOOD WORD FOR TOPOLOBAMPO.—The Auburn *Argus* of the 9th inst. says that L. A. Gould, who went to Topolobampo, Mexico, last autumn with the colonists, is still there and appears to be satisfied with things as he finds them. He writes his friends that the clamor in the papers is unwarranted, that the Owens have been made the objects of attack of envious people, and that the colony is all right, or likely to be so if left to itself. Mr. Gould went down to take charge of a ditch enterprise.

Climax PATENT Crates and Baskets. The best made. Indorsed by all leading berry growers. Prices low. Illustrated Catalogue free.

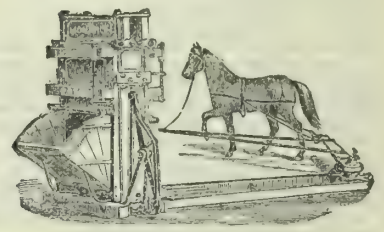
HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



ITS RECORD

For the first year of its existence is as follows: Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.

Two sizes: Compressed bales and common bales. Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., $1000.

THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., $500.

—THE—

Genuine Price Petaluma,

With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., $350.

Send for large illustrated Catalogue of above presses. Office and Factory, SAN LEANDRO, CAL. Address

NEW IMPORTATION

—OF—

NORMAN STALLIONS.

Theodore Skillman has just arrived from France with the choicest importation of Norman Stallions that has ever reached the Pacific Coast. Mr. Skillman has selected these horses from the best in France, with a view to the improvement of draft horses on this Coast. They are young and sure to suit the tastes of intending purchasers as regards color, etc., a number being coal black. He has also on hand some Imported French Coach Stallions. These horses are now very popular in the East and have long been the favorite carriage horses of France. Their merits speak for themselves. Come and inspect this rare collection of horses and be convinced that they are the best ever seen on this Coast.

Catalogue for 1887 sent free on application.

THEODORE SKILLMAN,

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, April 13, 1887.

General rains fell throughout the State three days the past week, cheering all. The rains, if followed more from time to time in this month, assure a large yield of cereals on the foothill lands, lowlands, and irrigated lands; but owing to the north winds in May and June, crops on the plains cannot be counted as sure until harvested. The rains have helped garden-stuff and also improved pasturage in many sections. The Eastern and European wheat markets have ruled barely steady throughout the week, with fluctuations reported in the Eastern markets. London cables received to-day are as follows:

LONDON, April 13.—Cargoes off coast, dull; cargoes on passage and for shipment, neglected; Mark Lane, turn easier; Cal. wheat just shipped, 39s; Cal. wheat nearly due, 38s; French country market, quiet; Liverpool wheat, spot, white firmly held; red, very dull; Liverpool wheat, Cal. 7s 6d to 7s 9d; weather in England, unspringlike.

Foreign Review.

LONDON, April 11.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: The wheat markets have been of a holiday character. Prices are unchanged. Foreign wheat is a shade weaker. Corn, oats, and all other articles are dull. The trade for wheat cargoes on passage or for shipment is at a standstill. There was no market to-day.

The Turkish Prune Trade.

NEW YORK, April 7.—The Turkish prune plot thickens, and trade is somewhat at a loss as to the next move of the syndicate. The estimate of the crop was placed by them in their original circular at 22,000 casks. Up to date 25,000 casks have been received here, and upon the way there are now 5200 casks, making the crop thus far 30,200 casks—8200 casks in excess of the syndicate estimate. Included in the quantity upon the way is 1400 casks which left Trieste on the 4th inst. It is reported on the street that the program of slate offerings has been continued. Hereafter sales will be made as the stock is required, by the trade. It is also said that the syndicate will to-day entertain offers of 5c. From reliable authorities in Europe information is received that the crop of Bohemian prunes reaches a total equivalent to 32,000 casks, of which quantity this country takes 13,000 casks.

Crops at the East.

CHICAGO, April 10.—Following is the weekly summary of the *Farmers' Review:* Complaints of drouth now come from all parts of the interwheat belt and are numerous in Ohio, Indiana, Illinois, Kansas, and Missouri. In nearly every county of Illinois the reports indicate that the ground is dry, and, together with the prevalence of cold winds, has retarded the growth and caused some injury to growing grain. Spring seeding has commenced in Illinois, Iowa, and Nebraska, but not under favorable conditions, owing to the dry weather. The fruit prospects in Illinois, Indiana and Missouri are poor, peaches especially having been injured, and there will be a short crop. In Ohio and Wisconsin fruit prospects are considered good.

Eastern Wheat Markets.

NEW YORK, April 10.—The aggregate number of bushels sold for the week has been rather moderate. The demand of both shippers and millers was light. Spot closed fairly steady at 1@1¾c higher for the week. Futures, unsettled at ⅛@1⅛c higher for the week.

NEW YORK, April 13—12 M.—93c for cash, 91⅝c for April, 91½@91⅝c for May, 91¼@91⅜c for June, 91⅜c to 91¼c for July and 90½@90⅝c for August.

CHICAGO, April 13—1 P. M.—Wheat stronger; cash, 79⅛@82c; May, 73⅞c; June, 71⅛c.

Eastern Wool Markets.

BOSTON, April 9.—There has been no improvement in the demand for wool. The sales of wool have been only 1,558,000 lbs of all kinds. Manufacturers continue to move slowly, and confine purchases to immediate wants. The only movement of any importance has been in Territory wools, which have been sold quite freely at low prices. The most important news in relation to the California clip is the reduction in freights which has taken place. Rates are more satisfactory, but still too high to admit of any profit in the handling of California wool at current value, for it is expected there will be a further reduction. There is considerable new spring wool on the way here, something like 750,000 lbs It is estimated this comprises the early arrivals at San Francisco, cleaning out that market. Wool was hurriedly shipped to take advantage of the rise in freight. Oregon wool is in fair demand, with sales of 55,000 lbs, at 16 to 21 cts; 20,000 lbs Eastern at 17 to 20c; 20,000 lbs Eastern at 18c; and 15,000 lbs on private terms. California fall wool sold to the extent of 90,000 lbs, but no prices could be learned.

NEW YORK, April 10,—The market remains dull and easy, Fine wools are held quite steady and sales were generally made at full prices. The sales of the week included 25 bales scoured California at 50c; 50,000 lbs Territory at 21c; 50 bales Colorado, 14,000 lbs scoured superior pulled, 20,000 lbs Oregon, and 10,000 lbs Montana on private terms.

New York Hop Market.

NEW YORK, April 10.—Transactions run almost wholly on small lots, medium and common qualities, that may be picked up cheap, with foreign goods figuring most conspicuously in the little business passing. Choice quality of Bavarians and Pacifics being in only moderate supply are held somewhat firmly, but find an outlet only to a very moderate extent. New York State, 1886, best, 20c; do common to good, 15@18c; do 1885, best, 11@12c; Pacific Coast crop, 1886, best, 20@22c; do common to good, 16@19c; do 1885, good to prime, 1@10c; German crop, 1886, best, 20@23c; do common to good, 14@18c.

California Fruit in Chicago.

CHICAGO, April 9.—Oranges are in good request, both on local and shipping account. The receipts from California of oranges are sufficient to fill all orders, the fruit from the Pacific Slope being taken in preference to that grown in other parts. The demand is only for the best and choicest grades, which are ruling firm, while cheap grades are hard to sell. Prices from the *Official Circular:* Bright Riverside, $3.50@4; San Bernardino, $3.50@4.25; Santa Ana, $3@3.25; Los Angeles, $2.75@3.25; Navel oranges, according to quality, $5@6; Duarte, $3@3.50; San Gabriel, $2.75@3; blood oranges, fancy, $5.50@7.75.

A moderate business is doing in dried fruits, yet not of sufficient magnitude to cause much change in the market. Stocks of dried fruits are, as a rule, small, and as a general thing a steady feeling prevails. Choice quarter apples appear to be in fair request and there is no trouble in selling evaporated, but common grades of quarters rule rather neglected. Peaches are almost nominal; they are scarce and at the same time without demand. The receipts of California dried fruits of late have been very small, and the market in consequence is quiet. French prunes, ℔ lb, 8@9¼c; plums, pitted, 10@11c; peaches, halves, 11@12½c; do, halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London Layers, 20-lb boxes, ℔ box, $1.40@1.50; loose Muscatel, ℔ box, $1.20@1.30; California Layers, ℔ box, $1.25@1.35.

Dried Fruit and Canned Goods East.

NEW YORK, April 10.—Canned Goods—The demand for most goods is hesitating. Buyers are satisfied to purchase from day to day, giving no attention to future necessities. Gallon apples are in better demand and firmer. Tomatoes, quiet. Corn is jobbing fairly. California canned fruit remains quiet and unchanged.

Dried Fruit—California raisins are moving rather more freely. Buyers, however, yet show a preference for dealing in small lots; but frequent drafts of this kind are making inroads into the stock. Prices are being gradually strengthened. Two-crown loose, California, are held at $1.25; three-crown do, $1.50; London Layers, $1.50@1.70.

Prunes—Turkish remain quiet, but firm at 4⅞@5c; Bohemian, quoted firmer at 4c; French, firm at 6¾@7c.

Currants are held steadily and selling at 4⅝c.

Citron, quiet at 17@17¼c.

California Products at New York.

NEW YORK, April 10.—Seeds quiet but steady; California yellow mustard 4¼@5c.

Local Markets.

BAGS—Rains the past week advanced sellers' views, but buyers at 6 cts for July delivery are scarce.

BARLEY—Rains caused a weeker feeling and a stronger selling, bringing about a lower range in values, but with clearer skies the market recovered under steady and free buying, and closing strong. Today's sales on Call were as follows:

Morning Session: Buyer season—100 tons, $1.-08⅜; 200, $1.08½; 100, $1.08¾; 200, $1.08⅞; 900, $1.09; 1400, $1.09⅛. September—100 tons, $1.03. Buyer 1887—100 tons, $1.13; 200, $1.14 ℔ ctl. Afternoon Session: Buyer season—100 tons, $1.-09½; 100, $1.09⅝; 800, $1.09¾; 300, $1.09⅞; 400, $1.10. Seller 1887—100 tons, $1.01½; 100, $1.01¾. No. 1 Brewing, buyer season—100 tons, $1.24. Buyer 1887—100 tons, $1.14¾; 1200, $1.14½ ℔ ctl.

CHEESE—The market is firmer under lighter supplies and a less selling pressure. The trade call is reported good for the season.

EGGS—The market for poorer qualities is very weak under free receipts from the East, but strictly choice are firm at full figures.

BUTTER—Although buyers are talking the market down, still the general tone is steady, with no further decline looked for unless a strong selling pressure sets. Both dealers and sellers are packing.

FLOUR—The market is strong at last week's advance. Several mills have shut down, some compelled to this course owing to the proprietors having shorted wheat on Call, so as to keep prices down.

WHEAT—In the sample market trading continues light, the only sales reported having been made are to short sellers. On Call the past week witnessed a fair degree of activity with a decline under strong selling owing to the rains, but with clearer skies prices recovered. Today's sales were as follows:

Morning Session: Spot, season's storage paid—100 tons, $1.74. Buyer season—100 tons, $1.80⅜; 700, $1.81; 500, $1.81½; 400, $1.81¾; 100, $1.81⅞. May—1300 tons, $1.76½. July—500 tons, $1.77; 600, $1.75¾. Buyer 1887—600 tons, $1.91¼; 100, $1.91½; 200, $1.92. Seller 1887—200 tons, $1.66¾; 100, $1.68⅜; 900, $1.67; 400, $1.67⅛; 1000, $1.-67¼; 300, $1.67⅜; 500, $1.67½; 700, $1.67⅝; 100, $1.67¾ ℔ ctl. Afternoon Session: Buyer season—300 tons, $1.82½. Buyer 1887—400 tons, $1.92½. July—100 tons, $1.77⅛; 200, $1.77¼; 500, $1.77. Seller 1887—500 tons, $1.68¼; 600, $1.68⅜; 400, $1.68½; 100, $1.68⅝ ℔ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

Owing to the great strength of the wheat market with all operators crying prices down, saying they are too high, more interest centers in the situation in the United States and Europe. The following is the latest statistical position in this country:

	Bushels.
The wheat crop in 1886	457,000,000
Liberal estimate for visible and invisible stocks July 1 last	80,000,000
Total for year's supply	537,000,000
Consumption for food to March 1 (pop. at 58,000,000)	180,000,000
Winter wheat seeding, 1886	35,000,000
Consumption in manufacturing arts	10,000,000
Exports to March 1, say	104,000,000
Total consumed and exported to Mch. 1,	329,000,000
Total visible and invisible March 1	208,000,000
With quantity of wheat on hand Mch. 1,	200,000,000
We shall require for food	90,000,000
We shall require for seed	18,000,000
We shall require for manufacturing, etc.	5,000,000
Total four months' requirements	113,000,000
If we carry over visible and invisible, July 1 next (as compared with 80,000,000 bushels last year)	50,000,000
We shall want for four months	163,000,000

Which would show but 43,000,000 bushels "available for export" on March 1 last.

The cable reported, March 29, a deficiency of 25 per cent in this year's wheat crop of several important provinces in India, and an indifferent output in several other Indian provinces. The wheat area in India in 1885–86 was 25,350,000 to 25,853,000 acres. The average yield of wheat in India is about 10 bushels per acre. The crop harvested in March–April, 1886, was 256,530,923 bushels, and the exports for the calendar year 1886 were 43,160,000 bushels. The exports for the season ended March 31, 1887, will probably be less than 43,160,000 bushels. Of the exports in 1886, about 54 per cent went to the continent of Europe. The crop of 1886, as indicated by the export movement during February and March, 1887, was probably about exhausted. It was for the week ended March 19 only 60,000 bushels, but was increased in the week ended March 26, 1887, by new crop wheat to 380,000 bushels. The wheat exports from India in April, May, and June, in bushels, were:

	1886. To United Kingdom.	1886. To continent.
April	1,051,597	2,392,738
May	2,788,938	3,964,242
June	3,138,296	2,552,252
Total bushels	6,977,831	8,909,232

The voyage from India to the United Kingdom via canal (including time for discharging cargo) is 45 days. Taking this into consideration, the foregoing India exports in the above months will indicate about what wheat supplies Europe can probably obtain in the three months to end June 30, 1887, on the assumption that the crop output and reserve shall be as large in 1887 as in 1886 and in 1885. During the five months to end August 31, 1887, with the increased continental demand this year over last, it is not probable that the United Kingdom will obtain much to exceed 10,000,000 bushels of wheat from India to supplement her more than 62,000,000 bushels of foreign wheat and flour required in that period.

The wheat crop of Europe in 1886 was 1,178,136,148 bushels, against 1,217,809,309 bushels in 1885. The normal wheat consumption of Europe is 1,372,000,000 bushels annually. Europe's deficiency this season on this basis is 193,863,852 bushels of wheat, which must be obtained from the several wheat-producing countries outside of Europe, against 154,000,000 bushels in 1885–86. As to supplies from Russia, the exports of wheat from the principal ports, not including overland shipments, have been in the 12 months ended December 31:

Bushels. Europe's supplies from	1886.	1885.
Taganrog and Rostoff	7,744,912	14,797,104
Odessa	12,130,400	29,096,000
Nicolaieff	2,487,328	5,625,152
St. Petersburg	10,403,304	12,584,236
Total bushels	32,765,944	62,102,492

Russia's wheat crop of 1886 is reported at 198,135,000 bushels, against 177,753,300 bushels in 1885, but the quality of the 1886 crop is inferior, and may not give, with reserves, little if any more surplus in 1886-87 than in 1885-86.

Crop advices on this coast are favorable for a full average in Oregon, Washington, and Idaho. In this State the rains of the past week greatly benefited wheat, but followed as they were by heavy winds, the moisture in the plains was partly absorbed; but the damp, rainy weather of the past two days has done much good. The plant on the foothills, in the lowlands and irrigated lands, cannot look better. The acreage of the State being less, even with well-distributed rains the outturn will hardly be as much as last year, while with hot north winds later on, the yield will be very considerable less. No one can predict with safety the yield in this State until after harvest, for even in harvest hot winds have been known to shell out more wheat than harvesters.

The wheat market the past week has ruled very strong, owing to light stocks and a large short interest combined, with all advices favoring a better market abroad. Transactions in actual wheat have been light. Two millers are reported to have brought western wheat to this market so as to keep our market down, but as the quality is not up to California wheat, the flour will hardly be as good as if made from the latter.

Barley has held to firm prices throughout the week, notwithstanding the rains. The consumption is increasing and supply decreasing. The acreage seeded to barley is below last year's, but the general outlook is favorable to a fair average yield to the acre.

Under light stocks, with very little to come forward, oats rule strong. The high prices restrict consumption.

Corn is strong at a slight advance; higher freights from the East are against buyers.

Rye and buckwheat are dull.

The demand for ground feed continues fair, with a higher range for bran and middlings, owing to a lessened output, caused by more mills shutting down.

Feedmeal is stronger in sympathy, with an advance in corn.

Hay is firm at full prices. Offerings continue moderate, and as the consumption is large, buyers are compelled to pay full prices, with now and then an advance for choice grades.

Fruits.

Strawberries continue to come forward sparingly, causing fancy prices to rule.

Apples are, as a rule, of poor quality. The demand is slow.

Oranges continue to move off freely, keeping the market well cleaned up from day to day.

Choice limes and lemons are in light stock, with sound good keepers fetching an advance.

All advices concur in reporting the prospects for a large fruit crop never better.

Dried fruits are slow, but as stocks are light, the market holds to strong prices.

Raisins are quiet, but as stocks are light, prices are maintained.

Vegetables.

Onions have been advanced to still higher figures, with stocks light and a good demand ruling.

Asparagus has ruled stronger under lighter receipts. Prices are too high for canners' use.

Under heavier receipts, peas have fallen to low prices, but canners are not disposed to buy yet.

New potatoes continue strong, at high prices, owing to light receipts. The first crop was killed by frosts, but the coming crop promises well. Old potatoes are very strong under a good demand and light supplies.

All other vegetables are fairly steady, under moderate receipts. The late rains have done an immense amount of good.

Live-Stock.

Rains and the prospects of better pasturage cause a stronger holding of both bullocks and mutton sheep. The consumption is increasing since the close of the Lenten season. The drouth in Texas is said to be in favor of this market. Hogs are steady. In horses and milch cows, there is nothing new to report.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 9½@10c; first grade, grass fed, 9@9½c per lb.; second grade, 8@8½c; third grade, 6½@7½c.

MUTTON—Ewes, 6¾@7c; wethers, 7½@8c.

LAMB—Spring, 12½@15c.

VEAL—Large, 6@8½c; small, 5@8c.

PORK—Live hogs, 4¾@5¼c for heavy and medium; hard dressed, 7¼@8¼c per lb; light, 4½@5¼c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	208,425	217,022
In port, disengaged	105,067	39,284
In port, engaged	12,873	42,636
Totals	326,365	298,942

The above gives a carrying capacity as follows: 1887, 524,667 short tons; 1886, 478,300 short tons; increase over last year, 46,360.

Wool is unsettled, owing to the uncertainty regarding what will be the freight rates to the East, and until this is settled buyers will not operate except at very low prices.

In hops there is nothing new to report. The demand is only fair for local use, and absolutely nothing for the East, owing to the unsettled condition of freights.

Pink and white beans are dull and heavy, under freer offerings, but other varieties are fairly steady.

Honey and beeswax are quiet, but steadily held.

Seeds are reported unchanged, but the general feeling is easy.

Poultry continues to come to hand sparingly, particularly choice conditioned, which causes a strong market to rule.

Nuts are firm, with the stock on hand light.

The stock of dried fruits is very light, which causes a strong market at full prices. Raisins, if choice and in attractive boxes, are steady, but the poorer qualities are hard to sell.

Tallow is firm at full prices, owing to lighter supplies, but hides are weak.

San Francisco, April 13, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

USE THE **STANDARD HAYING TOOLS**

FOR STACKING OUT IN FIELDS OR MOWING AWAY IN BARNS

The use of a good Hay Carrier and Fork a few hours in a catching time may save many times its cost. At such times, anything that facilitates the handling of hay lessens the risk from bad weather.

We manufacture Anti-Friction, Reversible, Swivel and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pulleys, Floor Hooks, etc. Also the celebrated Halladay Pumping and Geared Wind Mills, Corn Shellers, Feed Mills, Stalk Cutters, Horse Powers, Jacks, Tanks, Pumps, etc. Send for catalogue and prices. Agents wanted in all unassigned territory.

ARCTIC OIL WORKS,

Manufacturers of

INSECTICIDE!

FOR ERADICATING AND DESTROYING ALL PESTS THAT INFEST FRUIT TREES AND PLANTS, SUCH AS

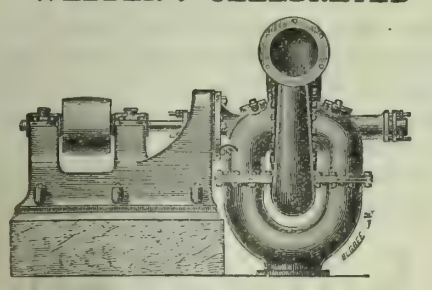
SCALE BUG, HARVEST FLIES, TREE HOPPERS, PLANT LICE, Etc.

It has been fully tested by the Agricultural Department of the State University, and pronounced a success, the endorsement of which we append. It is put up in convenient forms for use both in liquid and paste state.

For Sale in Barrels and 2 and 5-pound Cans in paste form, and in Barrels and 5-gallon Cans in liquid form.

Copy of Letter Received from the University of California, College of Agriculture, Berkeley, dated December 4, 1886.

J. N. KNOWLES, Esq., Manager Arctic Oil Works, San Francisco—Dear Sir: We have lately tested the Insecticide preparation of Whale-Oil Soap sent by you to us, and have found it to be very effectual against the Scale infesting Orange and Bay Trees here; also against the Thrips. From our previous experience with a similar composition, I think it will be found fully effectual against any small Insect Pests not specially protected like some of the armored Scales, and against which any Wash short of strong lye cannot be used. Respectfully,



E. W. HILGARD, Professor of State University.

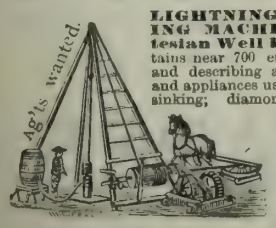
In the UNITED STATES,

Consisting of Wood and Iron Working Machinery. Pumps of every description.

ENGINES AND BOILERS

A SPECIALTY.



COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

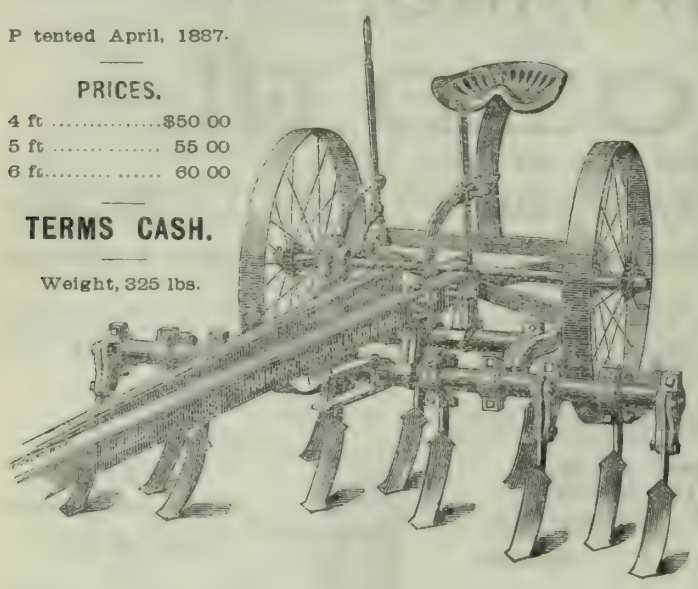
SEE SAW CULTIVATOR.



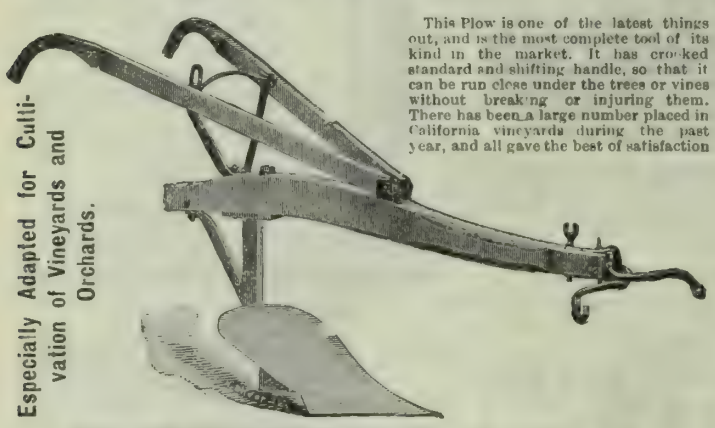
Patented April, 1887.

PRICES.

4 ft $50 00
5 ft 55 00
6 ft..... 60 00

TERMS CASH.

Weight, 325 lbs.



Don't Waste Your Time

By simply glancing at this machine, but read the following carefully, then order a SEE SAW CULTIVATOR, and you will never regret your purchase. It has points of excellence possessed by no other Cultivator manufactured, here or elsewhere. It is entirely a new inception, and has been the object of our special care and attention for many months, and we now KNOW we have the best Cultivator on earth.

1. It is all iron and steel. No wood used except in pole.
2. All the shovels are in front of wheels, so that all the work is done in full view of driver.
3. The gas-pipe beams are rigidly joined and pivoted to sulky frame and working easily on its bearings, thus giving great adjustability.
4. You may SEE SAW to your heart's content. The weight of driver exactly balances the weight of gas pipes and shovels, so that a pound pressure on lever in front of driver's seat will raise or lower the shovels, so that depth of cut is regulated with the greatest ease.
5. In all Cultivators with shovels behind the wheels the first movement of team away from the vine or tree causes the Cultivator to swerve toward instead of away from the vine or tree you desire to avoid, frequently resulting in serious loss. In the SEE SAW the motion away from the vine is positive, and the whole frame immediately moves in direction desired.
6. The axles are pivoted in center of sulky frame, and by use of lever, at right of driver's seat, the direction of the Cultivator may be instantly changed to right or left without changing the direction of team or touching the reins.
7. It is the only Cultivator that is a perfect SIDE-HILL machine. With all others you are compelled to work your team up hill continually, and cause your cultivating to be done in a slanting, awkward fashion, distressing to driver and team. We have done away with all this; simply use the lever to the right of driver's seat and throw the wheels toward the hillside. This gives the machine a tendency "up hill," but does not alter in the slightest the direction of the sulky frame or pole, so your team can travel along without the annoyance consequent upon side draft, and the hauling and dragging on the reins by the driver.
8. The machine is simply PERFECT. It is expensively made and great care has been used in its manufacture.

New Bradley Vineyard Plow.

Especially Adapted for Cultivation of Vineyards and Orchards.

This Plow is one of the latest things out, and is the most complete tool of its kind in the market. It has crooked standard and shifting handle, so that it can be run close under the trees or vines without breaking or injuring them. There has been a large number placed in California vineyards during the past year, and all gave the best of satisfaction

Price, with Wooden Whiffletree, $9. Extra Share, $3.

IMPORTERS, MANUFACTURERS, AND DEALERS IN

HARDWARE and AGRICULTURAL IMPLEMENTS.

PEERLESS No. 4 MOWER AND SELF-RAKE.

INCOMPARABLE AND MONARCH OF ALL.

Wherever this machine has been used, it is regarded with greater favor than any other of its class, owing to its UNSURPASSABLE WORKING QUALITIES, as uniformly exhibited in the field, both as a mower and reaper. Its career in this respect has been the MOST REMARKABLE—without a precedent in the history of combined machines. We note a few of its many superior features: It is exceedingly light in draft; does good reeling and raking; excels in delivering a nicely-formed sheaf; has a simple contrivance for stopping motion of rakes, and an excellent device for raising and lowering outer end of bar and platform.

No. 4. Price $140.

The machine is strongly and durably built, well balanced, and will cut grass and harvest grain in the MOST UNEXCEPTIONABLE manner.

It can be readily converted from reaper to mower, or the reverse, which is a very desirable feature, making it a cheap and convenient machine for a small farm, as it will answer the double purpose of mowing and reaping; and in reaping it will rake the grain to the side, out of the way of the team, so that there is no necessity of binding it as fast as cut. The same bar is used for cutting both grass and grain, and its width of cut in grass is 4 feet 9 inches; in grain, 5 feet.

PEERLESS NO. 6 SINGLE REAPER.

PRE-EMINENT AMONG SINGLE REAPERS.

Absolute perfection may never be achieved, yet it may be said that our No. 6 Single Reaper, in its present form, reaches that point as nearly as is possible. It would be a difficult matter to show wherein it could be made better or more serviceable than it now is. Its SUPERIORITY over other single reapers is distinctly noticeable in the MANY EXCELLENT FEATURES entering into its construction. Attention is directed to a few of the most prominent of these:

It is light in weight, yet strength, durability and utility have not been sacrificed to attain this end, as has been the case of a number of other single reapers.

The equipoise of the machine is all that can be desired. Its tipping arrangement is the most effective in use, and is conveniently operated. The outer and inner end of the platform and bar can be easily and quickly raised and lowered. It has a strong angle iron bar, which is superior to the wood bar found on other single reapers. The seat is located where the driver is entirely out of danger. It will harvest down and tangled grain as well as standing, in the MOST SUCCESSFUL MANNER, and deliver the NICEST sheaf of any Self-Rake made. The machine is painted in the most attractive colors. The width of cut of this machine is 5 feet 6 inches.

Price $115.

TWENTY-FOUR PAGE EDITION.

Vol. XXXIII.—No. 17.] SAN FRANCISCO, SATURDAY, APRIL 23, 1887. $3 a Year, in Advance. Single Copies, 10 Cts.

In the Canyon of the Rio Grande.

Readers who lately passed over the "Sunset Route" may recognize in the engravings on this page scenes which delighted them en route. It may be that the water fowl and the grand old buck did not appear; such features of a landscape do not generally materialize when most wanted, and the reader must take the artist's testimony as to their existence. There is enough, however, in the engraving to show that the scenery in the canyon of the Rio Grande is worth a journey to see. The mouth of this canyon is in Texas, about 750 miles westward from New Orleans. Major Ben. Truman, in his book, entitled "From the Crescent City to the Golden Gate," speaks very highly of the beauty of the river, which is the geographical boundary between the United States and Mexico. At one point he speaks of the canyon being bounded with vertical lime-stone walls on each side, from 250 to 300 feet in hight, and the tourist is treated to a scenic and engineering paradox of traveling a long distance up the river on a down grade. Two miles further west, the train enters a tunnel 1426 feet in length and 75 feet above the water line, emerging from which it moves along for several miles upon a wonderful piece of shelving cut out of the great limestone bluff overhanging the river and about 60 feet above it. This is pronounced by Major Truman one of the grandest pieces of railroad travel in the world, and is very beautiful and very impressive for quite a distance. The engravings give some idea of the startling and beautiful features of the railway conctruction and the scenery.

SCENES IN THE GRAND CANYON OF THE RIO GRANDE.

State Board of Horticulture.—The Board held its formal meeting in Los Angeles on April 16, following the Riverside Convention. Officers were elected for the following year as follows: President, Ellwood Cooper, of Santa Barbara. Vice-president, N. R. Peck, of Penryn, Placer county. Secretary, B. M. Le Long, of Los Angeles. Treasurer, Gen. M. G. Vallejo, of Sonoma. Auditor, Dr. E. Kimball, of Haywards. Inspector of Fruit Pests, W. G. Klee, of Berkeley. Executive Committee—Ellwood Cooper, A. Block and Dr. Kimball. The president was authorized to have published 5000 or more copies of a bulletin giving insect remedies reported to the Riverside Convention. The Inspector of Fruit Pests was authorized to make experiments in insect destruction, under direction of Executive Committee. Santa Rosa was selected as the place for holding the next State Convention, in November, 1887, exact date to be fixed hereafter. The thanks of the board were returned to Secretary Chester for efficient services rendered during the sickness of the regular secretary. Resolutions eulogistic of the late secretary, A. H. Webb, were then passed and the board adjourned.

Anti-Debris Association.—A special meeting was held in Yuba City April 13. G. W. Hutchins, of Yuba, moved that an Advisory Board, or Committee of Twenty (ten from Yuba and ten from Sutter) be appointed by the directors of the association, whose duty it should be to confer with the directors and the Executive Committee from time to time as they may deem proper and necessary. The proposition was carried unanimously. C. P. Berry, P. C. Slattery, Dr. D. P. Durst, H. C. Jones and A. H. Wilber were appointed a committee to select the names of 35 gentlemen, in connection with their own, making 40, from which to select the ten from each county. George Ohleyer read a long list of the names of the mines that have violated the decrees of the courts since the beginning of the anti-debris litigation. There were about 150 in all.

Oleofacture Prohibited.—Both houses of the Delaware Legislature have passed a bill prohibiting absolutely the manufacture and sale of all kinds of imitation and adulterated butter.

Important Address on Insects.—We give a good deal of space in this issue to a full report of the address delivered by Prof. C. V. Riley, U. S. Entomologist, at the Horticultural Convention at Riverside. The manuscript has been carefully revised by the author especially for publication in the Rural, and the address will be read with close interest by the many who are struggling with insect suppression. Other important features of the Riverside Convention will be noted later.

Practical Girls.—The Martinez *Gazette* speaks of the daughters of two farmers in that neighborhood as able to hitch up a horse, handle a plow, and do almost anything in the line of farm work. Are not such accomplishments more to be desired than those of city belles?

Land-Grabbers and Frauds.

Now that alien land monopoly and landlordism has been given a black eye by Congress and the Illinois Legislature, it is in order to look more closely into the land-grabbing frauds.

That the Government has been systematically swindled out of the public domain through the ingenious tricks and manipulations of landsharps and land-rings, is a matter of common fame. Their operations in this State were detected by Mr. Wilson T. Smith, Special Agent of the Land Department, during Mr. Arthur's administration, and under the auspices of Mr. Lamar, Secretary of the Interior, the special agents of the department have been silently but vigorously on the scent ever since. The culmination has come, and there is thunder all around the horizon. There is pale consternation in the camp of the grabbers. Their exploits as revealed by the vigorous report of the United States Grand Jury in this city and Portland, Or., is merely a part of a gigantic land-swindling scheme extending over eight or ten States and the Territories.

These frauds are usually committed by hiring men to go upon the land and acquire a colorable title. The Desert Land Act only allows a man to take up 640 acres in his own name, but it is easy to whip the devil round the stump, by employing some one to go and make desert land claims, and as soon as the proof is presented and recognized in the local Land Office, convey the title. It is true that men who engage in such a conspiracy have to commit perjury, but scruples of conscience seem to weigh very little when one is robbing the Government. Congressman L. E. Payson, of Illinois, in a notable speech in the House in February, said:

As to the land which requires actual settlement as is required by the Homestead and Preemption laws, here is a favorite way of doing it. The law requires there shall be proof of a house being erected, and that the man making the proof is the actual occupant of the land and resides in the house. They will build a house and put it on wheels. The man hired by the party desiring to make the entry goes in and sleeps in the house one night, then goes to the nearest land office and swears he lived in the house situated on the land 9x12 feet, with a second story, and all that sort of thing, giving a minute description of what for that country would be a pretty excellent house. Next morning a pair of oxen are attached to the house and haul it on to the neighboring piece of land, and the same process is gone through. My colleague sitting near me (Mr. Plumb) tells me a man in his town was one of a party of capitalists who, by just such methods, secured in one county in Nebraska 27,000 acres of the public lands, and the records in the department show it.

As samples of the gigantic frauds that have been going on, he called attention to one company that within a few years had procured over 30 miles of continuous water front on the North Platte river, and sufficient land behind this to control hundreds of thousands of acres, and another syndicate that by hook and by crook had got possession of an area larger than the State of Rhode Island or Delaware. But there is no need to go beyond the limits of this State for land piracy. Let us hope the Government may now be able to break up the whole rookery.

Irrigation in Inyo.—A large number of citizens of Inyo county have petitioned, under the Wright law, for an irrigation district to take water from Owen's river and its tributaries.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions

Ventura County Notes.

EDITORS PRESS:—A very acceptable rain of nearly one and a half inches, precipitated yesterday, has insured good crops in this county and at the same time infused new courage in the hearts of farmers, merchants and the real estate dealers. Grain of all kinds was looking backward and pasturage exceedingly short, but with these generous showers and the warm weather, vegetation of all kinds will grow rapidly. Much of our soil is of a deep, sandy, alluvial character, and retains moisture for a long time. We are almost sure to have showers later. Rainfall to date nearly 14 inches.

As a consequence of short pasturage, stock, both beef and mutton, is in poor condition, comparatively, though the quality of meat in the markets is improving and will continue to from this time on. There are always fat hogs for sale and numbers of them. Thousands are raised in this county, pastured on alfalfa or wild grasses and fattened on corn. Large numbers of these fat swine are, every month, shipped to San Francisco.

Ventura county can safely be counted on for an abundant harvest of grain, fruit, nuts, flax, corn and beans this season. Orchards are in splendid order, the trees full of blossoms or early fruit. Increased attention is being paid to horticulture, as it has been demonstrated that this branch of farming is very profitable here, and will be more so now we have railroad facilities for transporting our products quickly to market. Nowhere else in the State are there to be found finer apricot orchards. The trees bear large crops of very fine fruit that always commands good prices. Several large fruit-driers have been built within the last few years and one or more will be erected in the fertile Santa Clara valley this season. Nut trees bear excellent crops and we predict increased attention will be paid to this crop in the future. Prunes are not grown to any great extent, though we are informed that this fruit does well here. In fact, it would be difficult to find a nut or fruit tree that would not thrive here.

Apiarists are busy caring for their swarms of busy bees. The production of honey in this county, annually, is very large, and the labor and skill necessary to carry on the business is well rewarded. Thousands of swarms are located here and there in the hills in various portions of the county, bee food being found in liberal quantities most everywhere. Previous to last season the bees, in many places, destroyed a large amount of ripe fruit. So much damage did they do that orchardists threatened to make use of harsh measures if the apiarists did not remove their hives to some distance. In consequence, many hives were taken to well-located spots in the hills.

Land is appreciating here, and will continue to, owing, in great measure, to the building of the Newhall extension of the S. P. R. R. There are large grants, containing scores of thousands of acres, yet undivided, whereon very many families could, and will, when once they are divided, find pleasant homes. The soil everywhere is rich and productive and oftentimes of immense depth.

The mines in Lexington, in this county, are proving to be quite rich, and many seekers for wealth are flocking thither. The oil wells are yielding large returns, and new wells are being developed. This is one of the prominent industries of this county, a large amount of capital being invested in it and employment given to many men.

In favored localities irrigation ditches extend for miles through farms, water being taken from the numerous streams that rise in our mountains. By means of this water large crops, and several of them, can be raised yearly, though there are comparatively few acres that can be thus irrigated. Of course, farms adjacent to these ditches command higher figures than those differently situated.

We note an improvement in stock of all kinds. There is a desire to raise better breeds of cattle, horses and hogs. Norman horses, Holstein cattle and Berkshire hogs have many admirers and seem to be favorites. R.

Santa Paula.

THE FIELD.

University Distribution of Seeds, Plants, etc.

University Experiment Station Bulletin, No. 68.

The books of record of the distribution of seeds, plants, cuttings and scions, for the year 1887 were closed on April 1st. A review of the summary prepared by the clerk in charge of the distribution, reveals some facts which may be of general interest as showing the extent of this branch of the University's work, and the popular interest taken in it.

Bulletins 61 and 62, describing the material offered for trial, were issued the first week in January. The announcement was given wide circulation by the newspapers of the State, and it soon became apparent that the demand for some kinds of seeds and plants was far greater than the stock which we had been able to propagate. This fact shows the wide interest taken in local experimental work in this State, and encourages us to efforts for larger supplies for future offerings. It is, of course, not easy to secure always enough material, because it is designed to distribute only novelties which are not yet in the hands of the nurserymen and seedsmen. For example, two varieties of olives obtained through Mr. Pohndorff's importation were multiplied as far as the wood available for small cuttings would go, and yet the stock secured was not enough to fill half the orders which came in for them. It was much the same with the new varieties of guavas.

In the seed distribution most interest pertains to grasses and forage plants. The improvement of our pastures and meadows is one of the most important problems in California agriculture. The substitution of perennial grasses for the annuals which are running out so fast under close pasturing, the discovery of suitable forage plants for situations where alfalfa does not yield satisfactory results, are matters to which the people generally are wide awake, and our correspondence shows that the University distribution has already placed in the hands of the growers several plants which will serve an important purpose in ministering to these needs.

The tabulated statement below shows that the orders for forage plant seed was several times greater than for other kinds of seed, and though a large distribution was made, there was over 20 per cent of the orders unfilled because of lack of material. In all cases orders are entered according to the dates, and those first received are first filled.

The offering of seeds and plants by the College of Agriculture involves a plainly expressed obligation, which is assumed by the applicant, that the results of the experiment will be communicated to us, in order that a wide area of local experimentation may be in our view, as we endeavor to decide upon the adaptation of any industrial growth to the conditions in this State. We are glad to acknowledge that this obligation is being well discharged by a large proportion of those to whom we have sent materials for experiment. Our report for 1886, which was transmitted to the State printer last December, but which, unfortunately, has not yet been published, will show how active an interest there is in experimentation, how gratifying a disposition to communicate results, and how important are the facts that have been disclosed by local experiments. Of course, as the distribution widens and as larger numbers of voluntary observers are enlisted, still more interesting and important results may be expected.

Summary of Distribution of 1887.

KIND OF PLANT OR SEED.		AMT. DISTRIBUTED.
Hessian-Fly proof Wheats:		
Volo	(lbs.)	20
Missoyen	"	21
Atlanti	"	22
Textiles:		
Ramie	(plants)	270
Esparto Grass	(plants)	70
New Zealand Flax—*Phormium tenax.*	"	380
Flax:		
White Flowering from France.	(lbs.)	15
Royal from Germany	"	14
Russian from Pskoff	"	14
Yellow Seeded	"	15
Grasses and Forage Plants:		
Schrader's Brome—*Bromus unioloides*	(pkgs.)	142
Millet Grass—*Milium multiflorum*	"	63
Japan Clover—*Lespedeza striata*	"	86
Trees and Plants:		
Kikar or Gum Arabic—*Acacia Arabica*	(trees)	205
Black Wattle—*Acacia decurrens*	"	185
Back Wattle—Packages of Seed	"	42
Olives—Manzanillo and Nevadillo	"	224
Guavas—*Psidium pomiferum Cattleyanum and aromaticum*	"	201
Insect Powder Plants:		
Pyrethrum roseum	(pkgs.)	34
Pyrethrum cinerariæfolium	"	80
Miscellaneous:		
Bamboo—*Arundinaria falcata*	(plants)	78
Quinoa—*Chenopodium quinoa*—Seeds	(pkgs.)	40
Kaffir Corn	"	61
Cuttings and Scions:		
Apricots	(bundles)	175
Apples	"	204
Crab Apples	"	79
Pears	"	220
Plums	"	313
Mulberries	"	193
Vines, Native American	"	82
Vines, Asiatic	"	42
Vines, Huasco Raisin Grape	"	139

As the bundles of cuttings and scions average about ten sticks each, there were about 15,000 sent out in the course of the distribution. The demand for named scions of standard fruits is evidently large and the University orchard is serving a most important use.

In many cases the scions have been ordered for grafting in orchards to identify varieties of which the names have been lost, and in this way an opportunity for local comparison of fruits, grown under precisely the same conditions, is secured. In other cases the scions have been sent for to work over many of the old seedling trees planted in early days when seeds were used in place of young grafted trees which were not then available.

The distribution of New Zealand flax included a lot sent for planting in a large vineyard in Fresno county, where, if the plant thrives, the leaves will be used in tying vines. In the coast valleys it has been shown to grow well, and its use for vine-tying, and for other similar purposes, promises to be large.

The records show that in all, 631 orders were received, and material was sent into nearly all the counties of California. Packages were sent to 197 express and 429 post offices. The total receipts from applicants were $291.70, which was expended as follows: Packing material, etc., $54.13; wages, $90.25; expressage and postage, $85.27; money returned (to those who sent in excess of requirements), $61.99. Total, $291.64. This close balance of receipts and expenditures shows that the charges were well gauged to meet the cost of the act of distribution; and the charge has been of advantage in preventing idle application for what could be had for nothing, and has brought the material into the hands of those who really desired to experiment with it. Of course the expense of propagation of the seeds and plants is borne by the general funds of the College of Agriculture; applicants are only charged the bare cost of packing and transmission.

It may be remarked that this showing indicates the work that has been done in the way of promoting local experimentation in advance of the provision for such effort by the United States, in the Experiment Station law which was passed at the last session. It is expected that when increased funds become available under that law, this work will be proportionally advanced, as it is contemplated that each station shall constitute an additional center of distribution. E. J. WICKSON.

Berkeley, April 15, 1887.

ENTOMOLOGICAL.

An Ounce of Gold for an Ounce of Bugs.

The announcement that Mr. Hatch said at a recent meeting of the State Horticultural Society that he would give an ounce of gold for an ounce of the black ladybug with one red spot on each wing cover, has awakened wide interest. Some weeks ago Mr. S. W. Shafer, of Downieville, Sierra county, wrote as follows:

In the report of the meeting of the Horticultural Society, Mr. Hatch is made to say that he will give an ounce of gold for an ounce of ladybugs. I think I can supply him with bugs. My experience in ladybugs is this: The bugs seem to gather in bunches near running streams to winter, and last spring I gathered perhaps a quart and turned them loose on the ranch. They scattered about, and in a few days only an occasional bug would be seen. About July they became quite plenty and seemed busy among the trees and plants. I saw several with rosebush lice in their jaws, holding them clear of the bush. On strawberry plants they seemed to do most of their hunting under the leaves and at the base of the crowns. I found many clusters of insect eggs torn open in an irregular way, and chinch bugs have almost entirely disappeared. My clover at the second cutting was literally alive with ladybugs. I suppose my bugs were not all of my own breeding, but there were never half so many here before, and my place was never so free from insects injurious to trees and small fruit. My theory is that nature's remedies are best where they are discoverable. I will send you a sample of my bugs when the rain lets up a little.

This letter being forwarded to Mr. Hatch, he replied as follows:

Conditions of the Offer.

Mr. S. W. Shafer—DEAR SIR: Yours to Prof. E. W. Hilgard was received by me last evening. In answer to you will say, I am ready to pay as per my offer for what my offer was made, which was one ounce of gold or its equivalent in money for one ounce of a *certain kind* of ladybug, that is, a *black* ladybug with one red spot on each side—they to reach me alive. If that is the kind you have so plentifully, and you will send to me one ounce of them, I will send to you $20 in money. The common kind of ladybug is quite common here. —A. T. HATCH, *Suisun, Cal.*

The insect to which Mr. Hatch refers is the *Chilocorus*, as illustrated in the RURAL PRESS of July 24, 1886, page 81. They are well distributed over the State, but most people who have orchards probably consider their services worth more than Mr. Hatch's offer. The following paragraph by J. W. Rucker, in the Fresno *Republican*, relates to the same insect:

On the 29th of March of last year I was sitting near a south window writing a few stray thoughts, as is my habit at times, when I noticed for the first time these little spotted beetles, said to be destroyers of the San Jose scale. The gentleman who first brought to my notice their scale-destroying quality said to me afterward that they had disappeared from his orchard after cleaning the trees of scale, and that he should like to know what became of them—whether they died, or where they went to. Last fall, after these bugs had cleaned my trees of scale, they disappeared as they had done from my informant's orchard, but as they are now returning I am anxious to know whether they have come to harvest a second crop of scale or whether they will move on to others who have some of the old crop on hand. I was in hopes that they would not be needed in my orchard this year. I noticed their return a few days since inside a room in which there was a very warm fire. They would fly against the window, and there I caught a number and examining them with a glass, I found that they had the same distinguishing marks of those that were upon my trees last summer and disappeared in the fall. Whether they were hatched in the cracks of an unfinished room, or whether they hibernated during the winter, would be interesting to know. They are now fully grown. Is there some one who can throw light on the matter?

HORTICULTURE.

The Apricot in Southern California.

At the meeting of the Los Angeles County Pomological Society, held in Monrovia, April 7th, J. O. Matthewson, of Duarte, read the following essay on apricot culture:

Ladies and Gentlemen: I am to talk for a very few minutes on growing the apricot. I would say first of all that I am not a very observant man, but that during an experience of 20 years in nursery and orchard I have learned some things worth knowing in that line that may be of use to beginners.

To secure the best success in any direction, we must begin right. To begin right in the vegetable kingdom we must be specially careful in selecting the seeds we plant. I think as horticulturists we very seriously fail here. To plant poor, immature, unhealthy and diseased seed and then expect the best results is only to insure disappointment. We see this fact markedly illustrated in the history of citrus culture in the past and I think nearly equally so in deciduous trees. Now, in growing the apricot, we want first of all good, healthy, well-developed peach or apricot pits from healthy stock not affected with the gum or black-knot or blackwood diseases. If pits are planted from such trees they will invariably develop the same disease in the near future and make an ugly gap in your orchard. Nurserymen are not careful enough in their selections in this respect—indeed, where a large nursery is carried on, it is a very difficult matter to do so, and yet it is necessary to insure healthy stock. I regard the peach as the best stock for the apricot in certain places and for certain reasons. The trees bear earlier, they require less pruning, and enjoy freedom from gophers. They ought, however, to be planted where artificial irrigation is practiced, and not where the soil is naturally wet or damp.

For long life, none so good as the apricot root. It is a more vigorous feeder, does not bear so early, requires more labor to keep the tree in proper shape, is subject to the depredations of gophers, and also more liable to gum disease. So I take it, as we are a people rather impatient of results, I would advise the use of the peach stock for our apricot orchards.

This stock, at the age of eight or nine months, will be budded, close to the ground, closer the better, and here again we require great care in the selection of our buds, not only to see that they are well developed but also taken from trees free from disease.

In growing the bud for the first year it ought to be treated so as to throw the strength of the root forces into one main stalk. This can be done by early attention. I prefer one-year-old trees for planting in the orchard. Before the trees are taken from the nursery rows a sharp pruning-knife ought to be used to trim this yearling tree up to a switch, not leaving a single branch on the main stem, and cutting off the top also at the hight of four feet from the ground. Then take up the tree carefully, place it in the orchard at about the same depth as it stood in the nursery rows; if any deeper, not more than two inches—carefully spreading out the upper and lower roots horizontally, the tips slightly dipping. In taking all this care, we are to remember we are sure of ample reward in the future. It always pays to do things right.

In growing the future tree in the orchard don't be too hasty in rubbing off the superfluous sprouts. Let the tree get fairly started to grow. Foliage is absolutely necessary to root growth.

Then when the young sprouts are four to five inches long, go over all the trees. Cut or rub them off to within two inches of the top. In two months after, take a sharp pruning knife and cut off every sprout except three or four main branches at the top, and let them also be selected, so that they will be two or three inches apart—to save future splitting.

In the winter cut away two-thirds of these three or four branches—we are to remember we are training this tree for long years of usefulness in fruit-bearing, and we must begin right, as we desire a tree that will give us the least possible trouble in the future.

In this way a tree will bear its own load of fruit without propping up, and will also economize its root forces for future fruit-bearing. Treat your trees in this way for the first three years, and, other things implied, your orchard ought and will be a credit to you.

After the tree has been in position for three years in good soil, an average of 10 or 12 inches of winter rains, with good cultivation, is all that is needed for the future well-being of the tree.

In my orchard I have always kept my trees dry in the fall so far as I was able. I wanted the leaves to drop early, so that the trees might have a long time to rest and be ready to start out at the first approach of spring. I have given but little cultivation in the spring after the fruit is formed, rather keeping the weeds

under with the hoe. My object in this is to dry out the soil early and keep it hard around the tree, so that all surface roots would be retarded in their growth and tend to early ripening of the fruit. In this way I have secured ripe fruit in quantity about ten days earlier than any other part of the county I know of for the last five years. While pruning largely determines quantity, controlling the moisture at proper times around the tree largely determines earliness.

I have adopted the methods of pruning that have given me the largest returns, *i. e.*, cutting back to within 6 to 12 inches immediately after the crop is off. I also prune the Royal apricot in winter, as they have a tendency with me to overbear. If they require water at all, immediately after the summer pruning, at the end of July, is the proper time. The varieties I have grown are the Royal, Early Golden and Large Early. The Large Early is a very shy bearer and is not worth cultivating in our section. The Royal is better than the Golden. It will hang three days on the trees after it is ripe without dropping; the Early Golden will hardly do that, though it bears well.

My returns have not been large, but satisfactory, and all the more so because I've never had a total failure. A heavy year and a light one is the rule, but never a failure. From 416 trees, ranging in age from five to eight years old, I have averaged for the four years past about $800 net each year, and I am sure they have paid me better than any other trees on my place, considering the labor bestowed, except, perhaps, the lemon.

So far as diseases are concerned, I am inclined to think that the gum is often started by imprudent watering, starting an undue flow of sap that cannot find quick enough utilization in top surfaces, must find an escape some way, and comes out as a gum, especially in the crotches, where it is specially dangerous in heavy-bearing trees. To obviate this, I think less cultivation until the crop is off would have a tendency to help in this direction. I think it is true that apricots standing in comparatively damp ground are more liable to this disease than when planted in dry soil and needing artificial irrigation. I have been troubled very little with it. I cannot say as much in reference to black-knot. I think the only way out of this difficulty I can see is to be careful of our beginnings and never to deluge the trees with water.

And now I want to say that for our section here the apricot is peculiarly at home. By proper attention to our work we can grow large and handsome fruit. One year I had some, five of which weighed two pounds. The trees require but little care after being fairly started. The fruit is always in demand, coming from the 25th of May to the end of July.

The Stable.

Tulare Horse-Breeders' Views.

Editors Press:—John Potter, a pioneer of '49, farming in the neighborhood of Poplar, near Tule river, has been, for years, paying particular attention to the breeding of horses fit for various purroses on California ranches. He says the Black Hawk is rough, durable and fine for the saddle, but too light for draft. The Patchin is rather small, low and heavy set, but is a good roadster, a good trotter, and fine traveler. The studs are generally considered of bad disposition.

He has several horses of Morgan mixed with Goldfinder, which average in weight some 1200 pounds; are remarkably well proportioned, clean limbed and good travelers. The Peacock is another variety which he highly esteems, weighs from 1200 to 1400 pounds, is clean limbed, a good roadster or saddle horse, and is suitable for all purposes on the farm. Similar to Whip or Diomede.

On Mr. Potter's farm we were pointed out a light bay horse of about 1200 pounds, whose dam was out of a Peacock mare sired by an Orphan Boy, and whose sire was by English Coach and Black Hawk. This animal is represented as a good traveler, and as draft horse one of the very best of pullers. Also another, of much the same description and qualities, out of a Peacock mare, and sired by English Coach and Black Hawk. Mr. P. thinks 1200 pounds is as heavy as needed for general purposes. He doesn't wish to include in his horse pedigrees any of either Clydesdale, Norman or Percheron stocks.

T. J. Dale, 11 miles east of Visalia on the Kaweah river, who seems well informed and has long noted the best qualities in various breeds either reared in our country or introduced, recommends the breeding of large mares to ordinary sized horses.

A few years ago the Morgan and Black Hawk were regarded with high favor. They were sought after as furnishing the only reliable trotting strains in the country. Breeders of the present day want only thoroughbreds, such as are descended from the Arabian or English thoroughbreds. For draft horses, preference is shown for half-bred Norman or Clydesdale mixed with good trotters. On the farm, horses of 1200 or 1300 pounds are the best for general purposes. For best saddle horses, half thoroughbred and half mustang are preferred. In the matter of preference much depends upon taste and culture, and of these there is great variety.

Mr. Dale has on his premises the celebrated stallion Hubbard, of chestnut color, foaled in 1869, bred by R. A. Alexander, Woodburn Steed Farm, Woodford county, Ky., sired by Planet, 1st dam Minnie Mansfield by imported Glencoe, and having a long pedigree of best blood, running back through many first-class dams of most honorable history to Old Vintner mare of the 16th generation. He is full brother to Katie Pease, of famous turf record.

Hubbard in his day won many performances well worthy of note, competing with some of the most noted racers in New Jersey, Maryland and New York. Among these we will specially mention only two or three. October, 1872, at Baltimore, Dixie stakes, for three years old, 90 nominations on a dash of two miles, 110 pounds on colts, 107 pounds on fillies, Hubbard won, beating some colts that afterward became most famous, such as Joe Daniels, True Blue, Wheatley, Woodbine, Mate and others; time, 3:36½; value of stakes, $13,800.

At Saratoga, New York, August 2d, in a well-contested dash of three miles, he won, beating several noted horses, making time 5:34. At the same place, seven days later, he won in a hotly contested dash of 2¾ miles, beating Boss Tweed and Katie Pease; time, 4:58¾, the fastest on record.

The running of Katie Pease is reported to have been of the same sterling character, having made two miles in 3:32½; and in all distances, from a half mile to heats of four miles, she made a record which, according to the time test, is unequaled by any mare of the past or present.

Hubbard, at the age of 18, is now in honorable retirement, having the liberty of Mr. Dale's best stables and grounds. McD.

Tulare Co.

The Dairy.

Santa Cruz Dairies.

The *Sentinel* of last week has interesting descriptions of two dairies near Santa Cruz from which we take the salient points:

Wilder's Dairy.

About three miles from the city, in one of the many canyons that cross the coast road, is one of the most noteworthy and extensive dairy ranches on the Pacific Coast, the property of D. D. Wilder. On this ranch are employed 16 men who twice a day milk nearly 300 cows. Each man has certain cows to strip of the lacteal fluid, some to the number of 25. As soon as the pail is well filled the milker goes to a strainer close by and pours in the milk, which runs through a tin pipe and empties into a tank of 200 gallons capacity located in the large milk-room, wherein is a De Laval cream separator of wonderful power. The cream is separated from the milk and pushed to and out of a tube projecting from a stationary tin covering over the revolving vessel, thence emptying into a large can, while the creamless milk passes off, empties into a trough and is carried through an underground pipe to the pig-pen, a distance of 200 yards. This separator has a capacity of working 120 gallons per hour, and a six-horse power engine is used in running it.

Mr. Wilder speaks highly of the merits of the separator, and says that with it, in a period of nine months, last year, he turned out 50,419 pounds of butter, while from Oct. 1, 1884, to Oct. 1, 1885, a period of 12 months, by the old process, he turned out only 43,984 pounds. At present he makes 140 pounds of butter per day, all of which finds a ready market in San Francisco and Santa Cruz. In a clean and capacious room, adjoining the milk-room, is a large churn which is turned by steam, and it is said as high as 300 pounds of butter have been churned at one time. With the use of an ice-chest to draw the animal heat from the milk, and by the new process, butter can be made in half an hour after the milk leaves the cow. All the appointments about this dairy are perfect. Of the 2330 acres of land owned by Mr. Wilder, 80 are in cereals and 80 in hay, and a number of acres are in pumpkins and beets, while the greater portion is pasturage land. Mr. Wilder is yearly improving his stock by working in the Durham breed, and in time will make his dairy second to none in the United States.

Laird's Dairy.

About 12 miles from Santa Cruz, along the coast, is the 2200-acre dairy ranch, the property of Geo. P. Laird, a prominent citizen of this city. For a distance of two miles along the southern border of this ranch old ocean constantly plays upon a gently sloping beach, while close by in a sheltered cove, protected from the coast winds, are the barns connected with the dairy and a handsome residence. Surrounding these buildings is a level piece of excellent farming land, which gradually rises by a succession of hills and tablelands to an elevation of from 1000 to 1200 feet.

Some 500 or 600 acres of the hill-land is said by experts to be well adapted to the growing of the grapevine and fruits of any variety, while the lower land is excellent for grazing and farming, 200 acres of which have yielded as high as 110 bushels of oats to the acre. Over 100 acres are in grain at the present time, that will be cut while green and cured for hay. The yield will be from 250 to 300 tons. About 30 acres of land in the immediate vicinity of the buildings are utilized in raising vegetables, and, upon the land adjacent the streams, corn, squashes and beets grow fast and in abundance. As high as 60 tons of beets to the acre were gathered during last season. An important item in dairying is the large growth of native bunch grass that is found on this ranch, which grass greatly enriches the milk.

The location of the dairy and the cool weather that generally prevails in that neighborhood make it a desirable place for the manufacturing of butter and cheese. The highlands are warm and sunny most of the year, and free from fogs. The San Vicente creek flows the entire length of the southern portion of the farm, a distance of 2½ miles. This stream is well stocked with fine mountain trout, and during the spawning season large numbers of salmon run up this stream. Upon the northern limits of the ranch flows the Agua Puerca, or muddy water creek. Besides these two creeks there are numerous springs at different points, which afford pure and refreshing drink to some 300 head of stock. Of this stock, 200 are first-class dairy cows, that produce the richest cream. The butter and cheese find a ready market in San Francisco, and a large quantity is disposed of to Santa Cruz merchants.

Davenport landing is close by, just north of the dairy, where, in early days, during nine months of each year the farmers in this part of the county shipped large quantities of their produce, but owing to the dilapidated condition of the pier, and the expense attached to keeping it in repair, this point of shipment was abandoned, and now the farmers are obliged to haul their produce to Santa Cruz, some a distance of 20 miles. Let it here be said that if the new owners of the S. P. C. R. R. would extend their Boulder Creek branch to Pescadero and take in these coast ranches, it would open to the commercial world one of the richest dairying and farming districts in the State. Lack of facilities for transportation is the only drawback to this strip of country.

Holstein-Friesians.—There have been a number of very handsome publications made in this country in the interest of improved live-stock, but we doubt if any excels that of Smiths, Powell & Lamb, a copy of which we have just received. This firm is, of course, well known to our readers through their advertisements in the Rural and the many mentions we have made of the doings of their famous cattle in our columns. They are also well known on this coast by the large numbers of choice animals purchased from them by Pacific Coast breeders. The catalogue just issued has 244 pages, is profusely illustrated with excellent engravings, and bristles with statistics gained from the accurate records which are kept in the Lakeside herd. All interested in live-stock, whether breeding Holsteins or not, should have a copy of this publication on their shelves. We presume a copy can be had by writing to Smiths, Powell & Lamb, Syracuse, New York.

The Veterinarian.

The Stockman's Medicine Chest.

The *Breeders' Gazette* gives a list of remedies for the domestic veterinary treatment of farm stock, arranged in alphabetical order, with the doses for different animals:

Aconite Mixture—Tincture aconite, one dram; tincture of lavender, one dram; water, half pint. Action sedative; allays fever and externally relieves irritation. Dose: Horse or ox, one tablespoonful, with half a pint of water; sheep, one teaspoonful, with a quarter of a pint of water.

Alcohol, in the form of whisky or brandy, or strong ale, is useful for cases in which the system requires to be temporarily aroused from a state of depression. Dose: Horse or ox, whisky or brandy, four to eight tablespoonfuls; sheep, one to three tablespoonfuls. Strong ale, horse or ox, one pint; sheep, quarter of a pint.

Aloes—A purgative for horse or ox. The ordinary aloetic mass and the solution should be kept at hand; both preparations should be obtained from a dispenser. Dose: Horse, four to six drams of the aloetic mass as an ordinary purgative; ox, half a pint of the solution, usually given in combination with linseed oil, in cases of continued constipation.

Ammonia Liniment—Made by adding a strong solution of ammonia and oil of turpentine, an eighth part, to soap liniment. A pint bottle, carefully stoppered, should be kept on hand. The liniment is useful in an application for sore throat, and for all cases in which an external stimulant is necessary. Must be applied with the hand and well rubbed into the skin.

Areca Nut—A useful worm medicine. These nuts should be kept in a stoppered bottle in a dry place. When required for use, the quantity should be grated by means of a nutmeg-grater. Doses: Horse or ox, half an ounce to an ounce of the grated nut mixed with the food—corn and bran; sheep, two drams; dog, half to one dram.

Calves' Cordial—A form of chalk mixture for calves and sheep. To be prepared by a chemist, as follows: Prepared chalk, two ounces; powdered catechu, one ounce; ginger, half an ounce; opium, one dram; peppermint-water, one pint. Doses: Calves, two to four tablespoonfuls; sheep, one to two tablespoonfuls.

Carbolic Acid—A powerful caustic and antiseptic, ordinarily used in combination with 50 to 100 parts of water, as an antiseptic lotion to unhealthy wounds, and for disinfection purposes.

Carbolized Cotton and Gauze—To be obtained of the druggist. Valuable antiseptic application to wounds.

Castor Oil, also Linseed Oil—Purgatives. Doses: Horse or ox, one to two pints; sheep, four tablespoonfuls.

Colic Mixture—Equal parts of laudanum and sweet spirits of niter, and an eighth part of chloric ether. A half-pint bottle to be kept at hand. Dose: Horse or ox, two to four tablespoonfuls in three parts of a pint of water.

Electuary—A soft mass, compounded with honey or treacle; must be prepared by a dispenser as follows: Camphor, two ounces; powder myrrh, licorice root, and niter, each eight ounces; extract of belladonna, two ounces; treacle, enough to make a soft paste. Dose: horse or ox, a portion the size of half a walnut, to be put at the back of the mouth two or three times a day, with a piece of stick. Useful in colds, sore throat and influenza.

Ginger—Stimulant. Forms an essential part of all cordial powders for exciting appetite; may be given with strong ale in cases of prostration from overwork and disease. Doses: Horse or ox, one or two teaspoonfuls of the powder in a pint of ale; sheep, one-fourth of the quantity.

Mercurial Ointment (blue)—To be purchased ready for use. Valuable to promote the growth of hair, and in some forms of skin disease; only small quantities may be applied.

Mercurial Ointment (red)—Binioide of mercury. A good form for blisters in case of splint or after sprain of tendons.

Niter (nitrate of potash)—Diuretic and fever medicine. Doses: Horse or ox, two tablespoonfuls daily in the drinking water, or half the quantity in the food; sheep, one teaspoonful in the food.

Salts (Epsom or Glauber)—Common purgatives for cattle and sheep. Dose: Ox, 12 to 16 ounces, dissolved in a wine bottle of hot water. A tablespoonful of ginger may be added. Sheep, four to six ounces.

Salicylic Acid—A valuable antiseptic, effective in the treatment of foot and mouth disease. Dose: Four tablespoonfuls of the acid are to be put in an earthen vessel and dissolved in a quart of boiling water; hot water is then added to make a gallon. The solution is to be used to syringe the feet and lave the mouth and nostrils, and also to wash the udder, and finally to sprinkle over the litter; half a pint of the solution may be added to the gallon of drinking water every day. The dry acid (powder) may be sprinkled on the feet after they have been syringed with the solution.

Santomine—Used to expel worms; one of the most effective agents for this purpose. Dose: Horse, 15 grains, with three drams of aloes, to be given in the morning before feeding, and repeated after two days.

Sulphur (flowers of sulphur)—A very valuable alterative. Dose: Horse or ox, a tablespoonful, with a teaspoonful of niter, may be given in the food once a day; sheep, quarter of the quantity. Sulphur mixed with any common oil forms an excellent dressing for mange or surfeit in animals.

Turpentine, Oil of—Stimulant to the skin. Internally used to expel worms; useful in "husk" in calves. Dose: A tablespoonful daily, in half a pint of mixture of milk and eggs. Lambs, one-quarter of that quantity.

Vaseline—Emollient to the skin; effective in irritation of the surface, chapped heels, mud fever, especially if mixed with an eighth part of trisnitrate of bismuth or carbonate of lead (white lead) or oxide of zinc.

Zinc, Chloride of (Sir William Burnett's disinfecting fluid)—Mixed with 50 to 100 parts of water may be used for the purposes for which carbolic acid is employed.

Sheep and Wool.

The Mohair Market.

Editors Press:—We have just received the report from Turkey that, owing to the severity of the winter and the present scarcity of water, Angora goats are suffering severely. The report goes on to state that the clip this season will not be up to the average, either in quality or quantity.

Our Constantinople correspondent states that, even with a limited demand, the receipts of mohair are quickly taken and old prices sustained.

To our own knowledge, the stocks of Turkey and Cape mohair in Bradford, Liverpool, London and New York are all small and not desirable quality. In addition to this, there is an improved demand from our domestic manufacturers.

We do not say that these circumstances will lead to higher prices for the coming domestic clip, but we give you the facts and do say that growers should not sell their mohair until they know how the market will go.

Wm. Macnaughtan's Sons.

New York, April 5th.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Temescal Grange.

Last Saturday Judge Blackwood, of Eden Grange, enlivened the meeting of Temescal Grange with some very sensible and interesting remarks. The judge is feeling good over the result of the Constitutional Amendment election, especially the defeat of amendments No. 1 and No. 2. He portrayed in a very convincing way the fact that the successful defeat of these uncalled-for amendments was to be credited to the Grange organization and united influence throughout the interior of the State. There is a double satisfaction in their defeat, for the reason that a sharp trick was evidently practiced in calling an election so soon, and putting the State to such an unnecessary expense, when the amendment could better have been submitted to the next annual election after allowing a more suitable length of time for discussion and a fair consideration of the same on the part of the people. The good feeling of the speaker over the result of the election was heartily participated in by all the Patrons present.

Rev. Alfred T. Perkins, of Alameda, received the third and fourth degrees and gave the Grange some appropriate remarks. Quite a number of the brothers and sisters addressed the Grange and made good suggestions for the Good of the Order.

Miss Jessie Weed recited "The Young Fireman's Rescue" with good effect; altogether the meeting proved a decidedly interesting one.

District Lecturer Renwick is on a brief visit to his son-in-law, R. M. Jones, postmaster of Chico.

Brother Christian Bagge is still suffering from rheumatism, but is soon expected to be a regular attendant again at the Grange.

Much interest is manifested by the members of Temescal Grange in regard to the Danville picnic, and it is hoped that a goodly number will attend, including the newly initiated fruit-grower, Brother Perkins.

The Tulare Grange Meeting.

The following personal letter, received from a fellow-Patron and old friend, will be read with interest both by his former associates in Temescal Grange and by all those who note with satisfaction the signs that our Order is growing and thriving in California.

TULARE, April 9, 1887.

My dear Friend: Our open meeting of the Grange last Saturday was a success, and good results will undoubtedly flow from it. Bros. Overhiser and Flint shed the gilding of their character all over the meeting, and made us all feel as if we were each somebody. The forenoon was devoted to the amateur speakers of our Grange and locality; the afternoon to our worthy brothers from the State Grange. I inclose you my little effort, with which the meeting was opened, and which, on motion of Bro. Overhiser, was voted to be sent to the *Patron* for publication. I would have liked to introduce your idea of an experimental farm of 10 or 20 acres, near Tulare, but did not find fitting opportunity.

Quite a number of our brothers and sisters of the Grange, and of the visitors, spoke well and to the point. Among the more noted guests were Senator Roth, Major McQuiddy, and Messrs. Patterson and Fletcher. Senator Roth begged to be excused from speaking, and the meeting, taking his natural diffidence into consideration, permitted the loss. Mr. Patterson let his logic loose on the money department of thought as the main root of all our evil; that we were suffering the effects of broken laws, among which stood prominent the money evil and the love of it. Major McQuiddy, who has been a Granger since 1873, and others, followed, all agreeing that the remedy for farming troubles lies in judicious and well-managed organization; that every school district should be the center of a Grange in preference to meeting in towns and cities.

But the *chef d'œuvre* of the day was the mid day lunch. I cannot describe it, but those who have had the good fortune to partake of the hospitalities of our sister Granges can imagine, and those who have not will have to join a Grange to discover.

In the afternoon Mr. Elder occupied considerable time, as Bro. Overhiser, who followed him, said, showing that he evidently was not a Granger. Bro. Overhiser gave a detailed account of the origin of the Grange, its principles and subsequent history. Every one regretted that the day was too far spent to permit Bro. Flint to speak at length. We will long remember the genial sunshine of his benevolent countenance, and perhaps his outspoken goodwill will partly compensate the loss of his longer speech.

Bro. Overhiser is certain to leave his mark behind him as a Granger, go where he will; a better drummer could not easily be selected.

I hope all our friends in Oakland are well and prospering. Remember me to Temescal Grange. To-morrow is Easter Sunday. I wish I were with you to participate in all the memories of that day. Your very sincere friend,

J. W. MACKIE.

The Words of a Master Workman.

Representatives of the Knights of Labor, to the number of 200, met at Harrisburg, Penn., last week, to examine the various bills concerning labor before the Legislature. Thursday night a large public meeting was held in the House of Representatives. General Master Workman Powderly presided, and in the course of his speech made this manly and patriotic utterance:

"No matter what errors we have committed in the past, we have always aimed at doing right. We have always kept clear of one thing that brings odium on our country, 'anarchy.' We rejoiced, therefore, in the defeat of the Anarchist candidates in Chicago. I read of the result of the elections in Chicago the other day, and I was glad to see and hear that the workingmen of that great city were good enough to throw and lie back into the face of those who posed as their friends and representatives. No sooner did the Anarchist ticket go before the people than its supporter said: 'We will carry the ticket through under a flag on whose face not one star glistens and not one stripe is to be found, and the teachings of such men as Powderly and Griffiths will have no weight with us.' But they found on election day that anarchy was snowed under as it was never snowed under before. I say amen to that every time. [Great applause.]

"I did not know but in the decoration of this hall you might forget to place the American flag on the wall. That it might not be forgotten, I brought this with me this morning [here Mr. Powderly produced a flag, amid tremendous applause], and I brought it down here so that if we were charged with not being Americans we could show that we were. Let them to-morrow morning, after these outbursts of applause, charge us with being anything else but free-born American citizens, and these manifestations, which you have now given expression to, will be a refutation of that lie, which will ring down the centuries in condemnation of the red flag.

"Now, my brothers, we are here, and we will stand or fall by the sentiments you have given utterance to. We are here as Americans to teach American legislation in the interest of the American people, and in our American way; and, also, to say that those men who assembled 100 years ago in the city of Philadelphia and gave out the Declaration of Independence to the world were right when they declared that all men were created free and equal and endowed with certain inalienable rights, and that we believe they told the truth, and that it still continues to be the truth, instead of a living lie, as some of these men would have the people believe. We can do this without being Anarchists, and we do it without becoming partisans, and without being tied to the chariot wheels of either end of the Democratic or Republican parties." [Applause.]

In the *Journal of United Labor* for the 16th inst., Powderly says: "The Knights of Labor need not go away from home to get 'issues' to advocate. They have a declaration of principles, any one of which, if carried out, would materially advance the welfare of the human family. Take the fourth section of our platform, for instance, 'That the public lands are the heritage of the people, to be reserved for actual settlers. Not another acre for railroads or speculators,' and 'all lands now held for speculative purposes are to be taxed their full value.' The latter clause, especially, would materially lessen the tax-rate in nearly every municipality in the country by making it profitable to build. A graduated income tax, which is the thirteenth article of our faith, would more equitably divide the burdens of taxation. Doing away with banks of issue is the third important question which will soon have to be met, for the rapid payment of Government bonds will induce the issues of illogical and expensive National bank currency to ask Congressional sanction for some other means of keeping hold of this source of income. And last, but not least, a matter of vital importance to free Government, the State ownership of railroads, telegraphs and like means of transporting intelligence, passengers and freight. On this point the Knights speak with no uncertain sound."

Danville Picnic.

We believe that excellent arrangements are being made for the Grange picnic to be held at Danville, Saturday, May 7th.

There should be a large attendance from all Granges in Contra Costa, Alameda and Solano counties, and a number are expected from Stockton and many representatives from other parts of the State. We presume arrangements will be announced next week stating specifically the best means of reaching the picnic grounds from the railroad at Martinez.

The address to be delivered by the Rev. Dr. Horatio Stebbins will no doubt be one of rare interest.

BUENA VISTA GRANGE has installed officers as follows: E. Wheatley, M.; H. Davis, S.; Wm. Hutchins, A. S.; Mrs. J. Morgan, C.; C. Page, Treas.; J. I. Morgan, Sec.; E. Wheatley, Jr., G. K.; Mrs. C. Page, P.; M. A. Morgan, F.; Miss E. Page, Ceres; N. McMullen, L. A. S. The new Grange intends to meet twice a month.

Grange Reunion.

Enterprise Grange held its annual reunion at the Grange hall, near Walsh's, last Saturday. The *Record-Union* says that the attendance of farmers and friends was large and the feast bountiful. Our special correspondent at Sacramento furnishes additional points below:

EDITORS PRESS:—The day opened with floating clouds and kept so till noon; had it been sunshiny a larger gathering would have assembled at Enterprise hall. Still, there were upward of 150. At 11 o'clock A. M. W. M., W. A. Burch called the Grange to order, as there were no classes on hand. The Grange opened to the "Good of the Order." W. L., Daniel Flint opened fire, but would not go far, as he could combat to greater advantage after some hard-tack and coffee straight.

Bro. Thos. McConnell started on the same line, but, getting warmed up, spoke of the constitutional amendments and congratulated the farmers on having defeated the same.

Bro. Hack got the floor and threw out some good thoughts. Bro. Gregg, Sr., of Plymouth Grange, deployed his battery on prohibition, and made some good shots. Bro. Toomey, who always has the welfare of the guests at heart, and knows by experience the failings of the inner man, announced dinner was waiting, which made the gavel fall, and a general promenade was the result.

At 2 P. M. an open meeting was called. W. M., W. A. Burch was elected chairman. Bro. G. W. Hack made a few remarks on the best means of gathering our crops. Bros. Wilson and Hancock got on the railroad question, slow and fast carriage of freight. Bro. Toomey threw out the question, "How can we benefit the P. of H.?"

Bros. McConnell, Hack, Hancock and others spoke on the Interstate Commerce law—the evil it is working. Bro. Krull brought up the subject of Farmers' picnic. Bro. Fassett, secretary of the old board, stated that the finances were in good condition, leaving $100 on hand. Bro. McMullen moved that the present Master of Pomona Grange appoint a committee for this year, and the appointment be ratified at this meeting. Carried. W. M., Krull announced the following names:

Sacramento Grange—John Reith, Nelson Wilcox, Harry Beach.

Florin Grange—David Reece, L. H. Fassett.

Franklin Grange—James Bradford.

Enterprise Grange—Morris Toomey, Geo. Wilson.

American River Grange—David Taylor.

Elk Grove Grange— —Hill, Thos. McConnell.

O. S. Flint and Gregg, Jr. made some good remarks on concentrating our forces on one object—to the Good of the Order—rather than scatter too much and accomplish nothing.

W. M. S. G., Wm. Johnston took in Roseville. P. W. L., Overhiser was down in Tulare; so many of our heavy guns were scattered, but our W. S. L. put in his best—both in oratory and lemon pies. All felt happy and adjourned homeward bound. G. T. R.

Official Compliment.

Bro. George Ohleyer, of Yuba City, having for the past three years served the United States Department of Agriculture, as crop reporter for Sutter county, received the following complimentary letter from Commissioner Norman J. Colman, which illustrates how important results may follow the volunteer work of farmers who thoughtfully and carefully assist the Government in its endeavors to further the interests of the great body of agriculturists by presenting careful observations and reports from the field of labor:

U. S. DEPARTMENT OF AGRICULTURE,
COMMISSIONER'S OFFICE,
WASHINGTON, D. C. Jan. 11, 1887.

DEAR SIR: It gives me pleasure to assure you of my hearty appreciation of your valuable services. By efforts of yourself and others, this Department can and does save to American farmers, millions of dollars. Combinations to depress prices would be successful but for the public confidence in our crop reports. A single penny per bushel saved to farmers in the sale of their wheat is an increase of their net resources of from $4,000,000 to $5,000,000. This is only one item in your possible benefaction to your fellow-farmers.

In acknowledgment of your gratuitous services, I shall be happy to afford you any facilities, or grant any favors within the resources of the Department. Wishing you success in your personal enterprises, and satisfaction in your continued labors for the public good, I am very respectfully,

NORMAN J. COLMAN,
Commissioner.

To Geo. Ohleyer, Yuba City, Cal.

THE HORTICULTURAL HALL ASSOCIATION, at San Jose, held its annual meeting on the 13th. The total indebtedness April 1st was reported to be $50. The building is insured in six different companies for $6500. The following Board of Directors was elected for the ensuing year: A. B. Hunter, G. W. Tarleton, W. R. Woodhams, Cyrus Jones, Frank Dunn, W. M. Manley, Mrs. N. A. Saunders, M. E. Newhall and H. Pomeroy. The new board elected Cyrus Jones, president; Captain Dunn, secretary, and C. T. Settle, treasurer.

GRANGE ITEMS.—We note in the *Patron* that Bros. Flint and Overhiser have been at work in Fresno county as well as in Tulare; also that Woodbridge Grange has been discussing the Woman Suffrage question.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

NEBRASKA FARMERS have again taken hold of Grange work in earnest. Bro. C. L. Whitney, who has been working in the State as Deputy Lecturer of the National Grange with much success, writes: "I have the pleasure of announcing the reorganizing of the Nebraska State Grange, representing 26 subordinate Granges, and over 600 members in the State. They are well officered and start off in unity. They have come to stay. Active Deputies are at once to be put in the field. I expect they will soon number 100 Granges and 2000 members." Nebraska was one of the three States that lost their State Grange in the reaction which followed the hasty organization of years ago, with its mistakes, its false friends, and misconception or misapplication of the true principles of the Grange. But Grange *truth* is eternal and must go forward, and thus one more proof is given that when once understood the Order of Patrons of Husbandry must grow and prosper. Nebraska is indeed welcome once more to our great union of Grange States.

NATIONAL GRANGE lecture work is being pushed in other directions, and those States that are willing to help themselves, and desire to take part in the genuine and general revival of Grange work now going on, will receive all possible aid and encouragement. Let the "workers" in every State apply to their State Grange officers, and through them to the National Grange Executive Committee or Lecturer, and the speaker and the printed page will come.

THE Arkansas Legislature is now in session at Little Rock. Speaking of its membership, the *Rural and Workman* says: "The social, intellectual and political makeup of this body differs from that of former bodies of this character, owing to the fact that the farmer element is more numerous than heretofore. This, taking it all in all, is a decided improvement, which we trust and believe will result in great good to the interest of that class of our citizens."

THERE are tens of thousands of good farmers in the Granges of Canada. One of them truthfully expresses the sentiments of all our vast membership on both sides of the lines that divide those who are governed either by President or Queen: "Our Order seeks no forcible solution of the 'Labor Question.' Strike or boycott edicts come not from National, Dominion, State or Provincial Granges. It seeks not to unlawfully hasten the dominion, which is by divine right and ordination, and which shall be fulfilled when 'swords shall be beaten into plowshares and spears into pruning-hooks.'"

"THE issue of free passes in Pennsylvania was estimated by the members of the Constitutional Convention at $2,000,000 a year, which, if not taken from the income of stockholders, must have been made good by higher charges upon the general public." And yet the Constitution of Pennsylvania prohibits the issuing of free passes, and the Patrons of the State will never cease their efforts until it is enforced.

What a poky world this would be if we should all get into the ruts! Let us be up and doing, organize in Granges or clubs (the Grange is the better, because it is linked with similar organizations throughout the country, State and Nation), and make the year lively and productive of great good. If we do no more than get together for a social time it will pay; but we can just as well do much more. Organization is the watchword of the times. Farmers cannot afford to neglect it. And there is no better time than the present for organizing.—*N. E. Homestead.*

THE Grange has opened up an avenue for awakening thought and arousing the farmers to action upon the great questions of the day; those which never could have been reached in any other way. The Grange has made additional proof of the idea that our education is by no means entirely a product of organized schools, or employed teachers and printed books: While they occupy a very important part, they are not all that act on our powers to develop them. "Life is one grand school, and its every circumstance a teacher." The Grange, with its beautiful and practical lessons, has power to raise men and women from the humblest walks of life to positions of influence and power.—*A. J. Rose, Master Texas State Grange.*

PLENTY of news full of cheer comes to us from our many Grange fields. F. A. Allen, Worthy Secretary of the Maine State Grange, writes: "The unprecedented cold weather of the past winter has not chilled the ardor of the Maine Patrons. Neither have the half-hundred storms, with accompanying snowdrifts piled mountain high, clogged the wheels of the Grange car. 'Dirigo' is still written on our banner. Seven new Granges have been organized this year; one of these starts off with a charter membership of 73. Many of the sleepy Granges have had an eye-opener dropped down among them in the shape of a *live* Deputy. Frederick Robie, our popular State Master, is still the same warm-hearted Patron, and, freed from the official cares of State, is doing more work among the Granges than ever before. In short, the *Down-East Patrons are all right.*"

PROGRESS.—*Four more new Granges.*

ELLINGTON GRANGE, Conn., conferred the fourth degree upon 30 members. "About 160 good Patrons sat down to the feast so temptingly spread, which followed the degree work. A few bright speeches closed one of our pleasantest meetings."

"BOHEMIAN" and "Hulless" oat swindlers are at work in Maryland. Patrons, heed the "sign of caution."

DELAWARE GRANGE, Kansas, has more than doubled its membership last quarter.

"THE smallest wave of influence set in motion
Extends and widens to the eternal shore.

HIS NOTION OF A PICNIC.—**And this is the way the Martinez *Item* invites its readers to the picnic of May 7: "Remember the Granger's picnic at Danville. Bring your friends to view the most beautiful section of California, and come yourselves to eat boiled eggs and pickles, hear some scientific discourse by a number of first-class speakers, and if you desire, eat more eggs and dance the soles off your shoes."**

Agricultural Notes.

CALIFORNIA.

Alameda.

"Our Glorious Climate."—Irvington *Reporter:* E. Powell has in his lawn several fine specimens of date-palm and bananas now in bloom. They have bloomed for several years, but have borne no fruit as yet. This shows the perfection of our climate. The fact that such tender plants can live, grow and blossom for 10 or 20 years shows that there is never any severe cold; while that they will not fruit proves we have no hot and sultry atmosphere, such as would be disagreeable and disqualify the country as a healthful and pleasant residence-section.

Butte.

A Mountain Ranch.—*Record:* H. P. Ford has built up a splendid foothill ranch some 16 miles above Chico. He has about 500 acres, all tillable land, which can be irrigated from a spring capable of supplying 300 inches of water. It is situated in the valley of Chico creek, opposite the Forest ranch, formerly known as the Weld place—a well-known point on the Humboldt road, having an altitude of 2217 feet. The canyon of the creek is about 800 feet lower, making its altitude about 1400 feet. Mr. Ford produces all kinds of vegetables, corn and melons, and is annually increasing his orchard. He now has 1000 fruit trees in fine growing condition, and 300 to 400 in bearing; 35 to 40 orange trees are about ready to fruit. He has something like 30 acres in garden and orchard, and 10 acres in alfalfa. There is no prettier spot in the mountains.

Contra Costa.

Thriving Almonds.—*Gazette*, April 16: One of the finest almond orchards in the State is that of Judge W. W. Cope, of Green Valley. (A portion of it was planted by the former owner of the place, W. Z. Stone.) The orchard comprises 60 acres of almond trees, viz.: two acres, ten years old; 38 acres, three to five years old; and 20 acres planted this season. The ten-year-old trees produce from one to one and one-half tons of almonds to the acre. The young trees are bearing nicely. Last year the crop was sold to Littlefield & Allison for 12½ cents per lb., which was above the market price at that time. They were pronounced the best in the market. The cost of gathering and preparing for the market was but 2½ cents per lb. The two acres of old trees net about $400 per year. The trees are all healthy, and no scale has made its appearance on the place.

El Dorado.

Foothill Apples.—W. H. H. Fellows, of Placerville, has sent the S. F. *Bulletin* a box of apples of excellent flavor which were grown in Cosumnes township, El Dorado county, at an elevation of 3100 feet above the sea. Mr. Fellows has procured a considerable quantity of apples from Dominick Roubardier, of Indian Diggings, and knowing that they are only a fair sample of the apples grown in that township, where quite one-half of all the land is subject to entry under the Homestead and Pre-emption laws, will distribute them about the State with a view to attracting a share of the immigration arriving. He will soon send out apples from Georgetown, Mountain and Placerville townships also.

Troublesome Hunters.—A correspondent of the *Republican* is highly indignant at the reckless trespassing upon the inclosed ranches of farmers carried on by hoodlums from and around Shingle Springs. The more, he says, you are opposed to their encroachments, the more eager are they to come, breaking down your fences, riding horseback, with half a dozen hounds, all over your grain, shooting your wire fences in two, killing your stock in their carelessness, writing obscene language upon your notices, calling you the vilest of names, behind your back, and threatening your property should you attempt to have them arrested. If people buy property, labor upon it, pay taxes upon it, and pay, perhaps, two or three times over for it, it belongs to them, and their rights must be respected. They have perfect liberty to say who shall, and who shall not, infringe upon these rights, or give them over to the spoiler. Farmers are waking up in regard to this evil, and it is to be hoped that those who have the power to do will aid them in their efforts to stop it before precious lives are lost.

Fresno.

Rooted Grape-Cuttings.—Fresno *Republican:* The common custom has been either to plant grape-cuttings directly in the vineyard or to plant them in nursery and then transplant them into the vineyard the following winter. The objection to the first method is the improbability of getting a good stand of growing vines; and the second is objectionable, because the vineyard loses almost a season's growth. Mr. J. H. Sewell, of Central Colony, has adopted a plan which appears to be a decided improvement. He planted his cuttings some two months ago by putting them in a deep trench, top ends down. They were covered entirely with earth to a depth of three or four inches. He is now transplanting them into the vineyard, the roots having already started finely, while the buds are just beginning to swell. The fact that the lower ends of the cuttings were so near the surface accounts for their starting so early. Upon samples shown us the roots are already from two to five inches in length, and, as the ground is in prime condition, they would undoubtedly grow without interruption if properly planted. In planting these cuttings, care must be taken not to break off the young roots.

Humboldt.

Mad River Items.—*Standard*, April 9: Min. Hunt arrived from the Big Bend of Mad river Sunday, and brings a good report from that section. Notwithstanding the unusual depth of snow which covered the high ranges for weeks, they begin to feel the need of moisture. Several successive days of north wind occasioned this sudden dryness. Yet feed is comparatively plentiful and good. The winter losses of sheep were trifling in that region, but coyotes and other wild animals have commenced their depredations in earnest. Two weeks ago 15 sheep were killed on the Madrone ranch in a single night. Sheep on the Madrone and Big Bend ranges are in good condition, and lambs are abundant. A very few—perhaps not more than two—coyotes are doing the mischief in the Big Bend section. They are cunning, and almost universally evade the hunter. At this season they assail the lambs, and if the first one killed is not satisfactory to the coyote's taste, he may kill half a dozen before being suited. Ordinarily they will eat away the nose of the lamb, but if pressed by hunger may devour the beast. It is just before daylight that these destructive animals make their raids upon the flock.

Inyo.

From Owen's Valley.—Reno *Gazette*: G. W. Mapes has just returned from a brief visit to Owen's River valley, and has a very good opinion of the future of that section. The climate is good, the soil in many places loamy and fertile, and water for irrigating purposes plentiful. Several California capitalists have interested themselves with a number of settlers between Bishop creek and Independence, and an irrigating canal 30 feet wide and 30 miles long has been projected, the work of constructing which will probably be commenced within 30 days. A Mr. Rawson, of Los Angeles county, has, within a few months, invested $60.000 or $70,000 near Bishop creek in ditches, lands and improvements. A great deal of public land is being taken up under the Desert Land Act, and in many parts of the valley activity and enterprise are displayed. The valley cannot only supply the neighboring mining towns with ranch products, beef, etc., but also the southern part of California, with which it will soon be connected by rail.

More About the Irrigating Scheme.—*Register*, April 14: The canal is to be taken from the river on the eastern side, near Chrysopolis. Its capacity will be 15,000 inches, and its width 50 feet at the bottom, and the estimated depth of water will be three feet. Twenty thousand acres of land have been located, and the ditch to reach this land will be 25 miles in length—in fact, extending from the point mentioned clear to the lake. There is abundant capital and energy behind the enterprise, and it will undoubtedly be pushed to completion. Further particulars will be given as soon as ascertained.

Los Angeles.

Rotation.—*Express:* Many of our pioneer vineyardists are coming to the conclusion that their old vines (now about 28 years of age) are losing in vigor, and are digging them out to make room for young vines of choice foreign varieties. A number will let their land rest by planting to barley, potatoes or some other crop for a year or two before putting in the new vines, which is a good idea. It is safe to say that very few Mission vines will be set out in the future, as they have now proved themselves as susceptible to disease as any of the other varieties.

Citrus Stock from Florida.—Pomona *Times-Courier:* The first installment of an order for 55,000 orange trees, from Jordon's nursery, Marion Co., Florida, has arrived in Pomona. This carload lot consists of 12,000 trees, mostly sour stock, shipped through the agency of Twogood, Edwards & Cutter, of Riverside, and consigned to different orange-growers throughout the valley. The demand for citrus trees this season has been so much in excess of the supply that it has been found necessary to ship trees across the continent.

Sacramento.

Reclaiming Successfully.—*Bee:* Hon. H. M. LaRue, who returned on the 12th from Andrus island, says that the reclamation scheme has worked well there; that every acre on the island is under cultivation, and the crops are looking splendidly.

Fruit Shipments East.—Sacramento, April 18th: A special train of 12 carloads of oranges and one of cabbages was forwarded East from this city to-night.

San Diego.

Horticultural Association.—*San Diegan:* The annual meeting of the San Diego Horticultural Association took place at Monument hall on the 8th. The report of Treasurer O. S. Chapin was read, approved, and placed on file. Mr. Griffin stated that it was well known that the cottony cushion scale had been found in eight places in this city and an effort had been made to entirely eradicate the pest. Mr. Asher said the danger in spraying consisted in the too copious application of the fluid, thus washing the scale off, instead of soaking and killing it with a fine sprayer. He thought that sufficient attention was not given to burning and destroying rubbish about orchards and farms. New boxes should be used for fruit under all circumstances. Mr. Chapin favored the appointment of efficient inspectors to inspect every orchard in the county at stated intervals. The following officers were elected for the ensuing year: Pres., J. M. Asher; 1st V. P., W. E. High; 2d V. P., F. H. Heald; 3d V. P., Chester Gunn; Sec. Geo. H. Bower; Treas., O. S. Chapin.

Water Storage.—National City *Record:* Some three years since we located on certain lands, where we found well-diggings somewhat expensive, the water a hundred feet below the surface, and in a stratum of quicksand difficult to curb and control; but we observed upon our prospective ranch numerous dry water-courses, where the necessary element for vine and tree culture had been wont to course its way unobstructed toward the sea; and it occurred to us that one of these dry ravines, having an abundant watershed, could be easily and cheaply dammed, and the soft rain-water thus be made to do duty and pay for itself. The experiment has been tried, with most gratifying results. We have found this method for securing water much less expensive than well and requisite windmill; and the water obtained incomparably superior. Of course it is soft and perfectly pure, and when applied to vine or tree it is quite warm, instead of cold. In this temperature of our reservoir water, we have no doubt, lies the secret of the phenomenal growth of our trees, vines and vegetables. Orange and lemon trees set last year, from two to four feet in hight, bore some fruit late last year, others are now in fruit, and nearly all have a marvelous number of buds, blossom and fruit just forming.

Santa Clara.

Red Scale Abating.—San Jose *Mercury*, April 16: There seems reason to believe that the red scalebug is dying out. Orchards that have been badly affected, and which, early in the season, looked as though a fire had blasted them, are rapidly recovering, and in many cases the new growth has almost completely hidden the dead twigs, and the trees are becoming healthy. It is now to be hoped that the pest is dying out and will disappear.

Promise of Honey.—The rains cause much rejoicing among the bee-men, and the honey crop promises to be good. Early in the season they anticipated a failure, but the rains have made the change.

Santa Cruz.

Subsoiling.—*Courier Item:* While exploring the route of the proposed extension of the cliff road, our reporter observed the operations of subsoil plowing now being carried on by F. D. Bennett on the Hall ranch. Ordinary plowing in this country only turns over the surface soil to the depth of about four inches. The subsoil plow follows in the furrow, cutting and loosening the soil to an added depth of about eight inches, but does not turn it over or raise it to the surface. It permits air and moisture to circulate, and loosens the earth so that it will admit the root-fibers of the growing plants to find sustenance and moisture in the virgin soil hitherto impenetrable. Mr. Bennett expects to cross-plow this field and plant to corn. We shall watch the growth and yield and report to our readers later in the season.

Sonoma.

A Money-Making Lemon Tree.—*Index-Tribune:* Mrs. C. C. Carriger has a 15-year-old lemon tree on her place, one and a half miles from Sonoma, that has produced 44 boxes of lemons this season. At $1.50 per box (a low figure for these particular lemons), the earnings of this tree this year would be $66.

Poisoned Wheat.—Santa Rosa *Republican:* Friday afternoon J. P. Weems, while working around a house recently vacated at Sonoma, gave his horse a few mouthfuls of wheat found at the back door. In a few minutes the horse was dead. The supposition is that the family recently living there poisoned the wheat to kill squirrels, and had thrown it out. Though four children were with Mr. Weems, fortunately not one tasted the wheat.

Stanislaus.

A Useful Reptile.—Modesto *News:* Yesterday a large dog belonging to Joel Ripperdan killed a snake measuring over 5 feet in length and 20 inches around the body. The body showed large indentations, which were cut into to ascertain the cause, when his snakeship was found well filled with young squirrels, three of which were cut out almost whole. The snake was black, with yellow spots. It is rarely that a snake of the above species is seen in this county.

Tulare.

Hogs as Harvesters.—Charles Sanborn, one of the county's most enterprising and prosperous farmers, lately informed the *Times* that he had made and could make more money feeding his grain to hogs in the field than he could by harvesting and thrashing it, even when hogs were bringing only $2.25 per cwt. He finds that 80 acres of wheat harvested by hogs will net more to a farmer than 160 acres of grain harvested, thrashed, sacked and placed on the market. "Had it not been for hogs," said he, "I would have been bankrupt long ago."

Horses or Cattle?—Visalia *Times:* Several farmers were discussing the profits of stock-raising the other day. One stoutly maintained that the most money was to be made in raising cattle; but another rancher stated that he was raising horses, while a neighbor raised cattle, and that he had just traded a number of colts to the cattle-raiser, receiving therefor two two-year-old steers for every two-year-old colt. It had cost no more to pasture each colt on [illegible] than it had cost to pasture each steer.

Tehama.

Shearing Commenced.—Red Bluff *Sentinel:* A band of 3300 ewes and 3000 lambs, belonging to H. A. Rawson, passed through town Saturday, from the north en route to Mr. Rawson's shearing pens on Red Bank. Cone & Ward have commenced shearing their band of 8000 wethers. The sheep are carrying a year's fleece.

Yolo.

Strawberries.—*Mail:* Martin & Baker have three acres planted out to this delicious fruit, three miles north of Woodland, near Nelson's bridge, from which a box of berries was picked on April 9th and brought to our office, each berry measuring from 2⅛ to 3½ inches in circumference. The indications are now that these gentlemen will take from $2500 to $3000 worth of berries off from this three-acre lot. Who among our wheat farmers that planted 160 acres last year realized as much? Who says that a family cannot be supported off from 20 or 40 acres of our Yolo county land?

Crop Prospects.

The reports that have been coming in from different portions of the State, since last week's general rainfall, are right cheery and hopeful. With but few exceptions "the farmers are jubilant" at the outlook; and in Northern California the showers of Tuesday night have deepened the previous confidence in good returns from the fields. Lassen and Mendocino, Colusa and Yolo and Sacramento sing the same song of glad anticipation. The Petaluma *Courier* says: "The grain crops were never more promising at this season of the year. So far we have not heard of the Hessian fly, and from present indications the little grain pest has taken his departure—we hope forever."

In the San Joaquin, where the early drouth was so depressing, a tone of encouragement prevails. The Merced *Argus* of last Saturday pronounces the grain crops of the valley "as forward as usual at this time of year," and adds that "the rainfall along the foothills and in the mountains has been much heavier than here, and farmers and stockmen are well pleased with the situation. On the adobe lands crops promise well and will require but little more rain to insure a full average. The sand-plains also, since the warm weather set in, are making a good showing for all kinds of small grain—summer-fallow especially being considered good for a full crop."

Even in Tulare and Fresno, where apprehensions had been most serious, from half or two-thirds to a full average yield is now hoped for. The Tulare *Register* remarks that "the territory within eight or ten miles of the foothills is almost certain of good crops from one end of the county to the other. * * * All the irrigated portions of the county will have good crops, but some of the plain land west of the railroad will fare rather badly, unless rains continue very late in the season. Good reports come from Mussel Slough and the 76 country. Harvesting will be less expensive than last year because the straw will be lighter; weeds will not be so troublesome, and indications all point to better prices than were obtainable last year."

In the coast counties south of the bay, and in Los Angeles and San Bernardino, the outlook for grain and feed is at least satisfactory.

The fruit prospects throughout the State are uniformly bright. Some little frost-work is mentioned in Lake and Napa, and even in the big Nadeau vineyard near Florence, but no material damage has been reported; and the large body of snow that has been piled upon the mountains gives assurance of plenteous water for summer irrigation.

A Valuable Fertilizer. — In another column may be found the advertisement of the Mexican Phosphate and Sulphur Company's fertilizer, from their Guano islands in the Gulf of California. This article is pronounced by Professor Hilgard, of the State University, to be of a high grade and especially adapted to use in our State on account of the predominance in it of phosphoric acid, of which our soils are scant. In view of the gradual impoverishment of our lands, which have been worked from the earliest days without fertilization, it would be wise for our farmers and fruit-growers to give this valuable fertilizer a thorough trial. This company, of which H. M. Newhall & Co. are the agents, has been engaged for two years past in exporting it to Europe, where there is a ready market for all they can ship. Their thoughtfulness for California, in introducing it here, should be recognized, and encouragement should be given the enterprise on account of the benefits likely to accrue from its use to the agriculturist and the State at large.

Draw-Gate.—S. T. Coulter, of Santa Rosa, Past Master of the State Grange, has invented a draw-gate that has many excellent features for opening and closing. He has placed one on his farm at the main entrance, which has been in practical use for some time. Any person can open and close the gate with but little effort while sitting in a buggy. We expect soon to illustrate this gate with full description in the Rural Press. From a cursory examination, it seems to be in cost and adaptability one of the best if not the best gate that has been placed before the public.

The Jutland Stork.

[Written for the RURAL PRESS by DAGMAR MARIAGER.]

The rainbirds flock to mead and *kjar*,
With chorus of "peewit,"
Where nests quite safely hidden are
From foes; but one foul wit
There is, who cruelly does loot
The frog-ponds and the reeds,
And, unlike trade rats, gives no boot
For thefts on which he feeds.

This thief is worshiped as a saint
By peasant, lord, and child,
And promenades without restraint
The lawn or morass wild.
Though bird of passage many claim
(If true, he's somewhat kind),
In April comes he with his dame,
His last year's nest to find.

He finds it on straw-thatched roof,
Well-kept by courting peasant,
Who knows the stork brings ample proof
That all his wishes pleasant,
Of ample harvests, health and gold,
Are sure to be forthcoming,
If he his spread wings choose to fold,
Returned in April gloaming.

He knows his license, and 'tis said
He loves his fatherland,
When Egypt's streams he cares to wade,
Which are at his command.
His storklings take a week's advance,
In early autumn time,
Then wife and he the sea's expanse
Face for a milder clime.

In winter quarters, safe and sound,
He rests him with his band,
Then enters on his daily round,
On one long leg to stand.
Perched on some chimney for the night,
Or with majestic poise,
March, forage lowlands, or take flight
In migratory choice.

Then when he hails the coming spring,
He cries out "Fatherland,
I come, I come on eager wing
Unto thy lovely strand!"
Then spreads his pinions, speeds away,
And on and on he goes,
Till Denmark's youth in greeting stay
Him with stork-songs he knows.

Santa Barbara.

Bonnie Lassie.

[Written for the RURAL PRESS by HOONOS].

(*Concluded from our last.*)

Days passed, and Lassie neither saw nor heard from Rob. She began to worry secretly over this first serious quarrel with him. Two weeks after the picnic her father handed her a note which he had brought from town.

"I met Rob in town," he said, "an' he gave me this note—some invitation, I s'pose. He looked sorter glum. Hadn't saved up as much as he wanted for that house of his—eh, girl?" and he pinched Lassie's blushing cheek ere she turned to run upstairs to read her letter in private.

Lassie had thought much in the last two weeks. Rob's absence and silence had taught her how much she would miss him if he were permanently estranged. Her fingers trembled with eagerness as she opened the note. It was short, but contained enough to make Lassie sink into a chair and turn faint and white:

Darling Lassie: Though you cast me off, I can't help loving you, and for your sake I am going away. You said that you wished I would go, and that if I stayed you would hate me. I can't stay and see you love another, and it would be worse than death to have you hate me. I am going to China and then to Australia with my brother, and I never intend to come home again. I hope I'll be drowned, as life is worthless to me without you. Good-by, my darling, and may God bless my bonnie Lassie. Yours for life and eternity,

ROB.

Lassie hid her face in her hands and sobbed, after the first shock was over.

"O Rob! dear Rob!" she moaned, "I loved you after all. How can I bear it to have you go away?"

But remembering that perhaps he hadn't gone yet, she hastened down and out to the barnyard, without waiting to dry her eyes. There she found her 14-year-old brother.

"Henry," she said, "saddle up Beauty right away and then come to me! Be quick!"

"What's the rush?" he asked. "Who is going where?"

"Don't ask questions now. I haven't time to answer. It's *very* important. *Do* be quick, *dear* Henry."

Having started him, she hurried back to her room, and with trembling fingers penned the following:

Dearest Rob: Don't go. I didn't mean what I said. I *do* love you, dear. Stay, and come back to your penitent LASSIE.

This she sent, by Henry, to Rob's home, and then waited in a fever of anxiety for his return. She flew to her mother and on that faithful breast sobbed out the whole story of the quarrel about nothing and Rob's sudden determination to leave. Lassie was blamed and soothed in the same breath, and was almost calm when Henry returned.

"He went to San Francisco on the train this afternoon," said the breathless boy. "But his brother will send the letter after him. It may catch him in the city, or else it will follow him to China. Say, I'm hungry. Supper most ready?"

After the first shock and intense grief at Rob's departure with anger in his heart, Lassie's hope sprang up brave and strong. She haunted the postoffice for a week, feeling, with the confidence of youth, that Providence *must* arrange matters so that Rob would get her letter before he left the city. When this hope was killed by hearing that the steamer had started with Rob the very afternoon he had reached the city, and when she knew that he could not return until her poor little note followed him to China, then she felt the full force of her loss.

She began to read the Marine News in the paper, and whenever a ship arrived from China, she would go to the postoffice with renewed hope. The white-haired old man who distributed the mail would hand out the letters with a deliberateness which drove her almost frantic.

"Thar's a paper fer J. P. McLane, an' a magazine fer Douglas M. McLane, an' two letters fer Mrs. Matilda McLane, an' that's all."

"Surely there *must* be a letter for me *this* time," pleaded Lassie. "Look again, grandsire—perhaps you missed it. Please look again."

But none came for Lassie, and she, poor girl, would go back to her home and her work with a fresh pain in her heart.

"Mother," she said one day, as they sat sewing, "do you believe I really love Rob? I miss him and long for him all the time, but my appetite is still good. If I love him so, why don't I grow pale and thin?"

"My dear child," answered her mother, with a tender smile, "you have a healthy mind and body. It is not the truest love that makes one peak and pine. Love should make one braver and better, and I have rejoiced to see you keep on at your work with such courage."

"But in books, the nicest girls always grow pale, and their eyes grow large and sad when their lovers leave them," insisted Lassie; "but I am as plump and rosy as ever, and my eyes aren't a bit larger."

"Your outdoor, active life keeps your appetite up," said her mother, "so your health is uninjured, thank heaven. But I have noticed one or two effects of your love."

"What is that, mother?" asked the girl, eagerly.

"Since the first absorption of grief has passed away, you have been gentler with the children; you have tried to control your hasty temper, and have tried to be more thoughtful for me."

"O mother!" cried Lassie, with tears in her eyes, "has there been any difference? No one knows how hard I've tried."

"*I* know, dearie," said the mother, smoothing the curly head.

"I knew it was my fault Rob went away," murmured Lassie brokenly. "I knew I had been hasty—unkind. I felt I ought to be different—try to do better—so I wouldn't have cause to regret anything else as I do this. O mother! I feel, like Cain, that 'my punishment is greater than I can bear.'"

Lassie sobbed on her mother's breast and was comforted.

* * * * *

Two years passed away, and Mayday dawned fresh and clear once more. A year ago, Lassie had stayed at home and cried herself sick at the memory of that other day. But to day, her mother persuaded her to go with them.

When the dancing began, a bronzed and bearded stranger took his station under a tree to watch the dancers. The one his eyes rested on oftenest was bonnie Lassie. At the close of a dance she happened to glance toward him. Through the disguise of thick beard and brown skin which had hidden him from all others, Lassie knew her lover. Her cheek paled with deep emotion. Quietly leaving the dancers, she approached him with outstretched hand.

"Rob?" she murmured beseechingly.

He hesitated, flushed, and finally took her hand as though against his will. To break the embarrassing silence, he took refuge in a commonplace "I'm glad to see you enjoying yourself, Miss McLane."

But Lassie, unconscious of any one but Rob, still kept her eyes fixed on his with a tender, pleading look.

"You have never forgiven me! O Rob!" she said, with a half sob.

"The people are all staring at us," said Rob, with a man-like dread of scenes. "I have a buggy here. Will you go with me?"

Without a word, Lassie followed him. Neither spoke until they were out of sight and sound of the picnic. Then Rob, turning toward her, saw her sitting, pale and trembling, with tightly clasped hands and unshed tears dimming her sweet eyes. All the accumulated bitterness and resentment of two long years melted away at the sight of Lassie's grief. He drew her to him and kissed the quivering lips.

"Darling Lassie," he whispered, "I love you still—love you forever."

"O Rob!" sobbed Lassie, "I loved you all the time."

Everything was settled then and there, and for awhile the horse chose its own road, while the reunited lovers enjoyed the bliss which comes but once. When the horse tried to cross a deep ditch, the young folks descended to earth once more and entered into explanations. Rob had never received Lassie's note, but had wandered from land to land, trying to forget her, till, drawn by the love which would not die, he had wandered home again, with money enough saved to buy a farm.

Two months later the McLane house was greatly excited, for it was Lassie's wedding-day. Rob refused to wait longer.

"I want to be sure of you," he said, teasingly, "before you get mad again."

"O Rob!" cried Lassie reproachfully, "I never, never get mad at you now."

Lassie and Rob were alone in the parlor, when Henry brought in a letter for Rob. It was Lassie's note which had followed him everywhere, reaching each place just too late. They read it together, and Lassie dropped a shining tear upon it, but smiled the next instant, for Rob took her in his arms and kissed her, saying:

"Never mind, dear. It is a wedding present from Uncle Sam. And in spite of its failure to reach me before, we are now united in happy love, my darling Bonnie Lassie."

Livermore, Alameda Co.

Fashion in Fiction.

[Written for the RURAL PRESS by A. F. BATELLE.]

Fashion rules the world—ay, a variety of worlds. The world of dress is the one over which its sway is most despotic, but it extends even to the field of literature. To prove this, let us cite a few instances to be found in fiction.

A few years since the accepted heroine was a girl with "midnight eyes" and "tresses the hue of the raven's wing." Then as blondes became the accepted type in fashionable circles, they were received into novels also, and, at the present moment, the maiden possessing gray eyes and tawny mane (otherwise golden brown locks) is the one about whom romance twines. Of course when one knows the particular beauties of her eyes, hair and complexion, she is ready to be booked.

She may count *know*, *throw* and *blow* as regular verbs; she may never have read English history or heard of Michael Angelo, but she makes just as good a heroine.

This, however, is explained by a line from "Nasby's" "Hanner Jane":

"Her *dear* she spelt with double *e*,
Her *kiss* had but one *s*;
But when a man's in love,
What's one letter more or less?"

Fashion asserts itself in plot as well as in the type of the heroine. When I began reading novels, the thread of the story usually ran in this way: Characters—young man, maiden. The side personages to suit the taste, whose principal occupation should be that of placing obstacles in the way of the principal actors. Who ever heard of the course of true love running smooth?

When opposing forces died, which they always did most opportunely, a happy denouement was rung by wedding bells.

This plot became threadbare—in fact, wore out so entirely that another had to be substituted. Since stern fathers no more keep ferocious dogs or shotguns to use on Romeo, our novelists adopted another and more sensible course.

Recognizing the fact that not even plighted lovers have angelic tempers, they use a quarrel to separate them; the girl marries, is left a widow, then united to the object of her youthful affections. Or a more common plot—girl jilts; young man faithful for 20 years, then marries a girl half his age. Really, the tendency is toward girls who still cast a lingering look at their dolls, being wooed by men whose years number two-score. And another quibble of fashion is to make the story realistic. Some writers succeed so well that after a careless perusal we wonder if it is not true, and if we have not discovered an author who is tediously fond of details. But since we read the stories and enjoy them, why complain?

Marysville.

HOUSEWORK PREFERRED TO SHOPWORK.—The key to the much-mooted servant-girl question lies in recognizing the fact that every human being needs a measure of personal freedom—of respect *as an individual*, with some tastes and interests of her own. In a true republic, the cook or the chambermaid may rightfully claim to be treated as a helper, not a helot. The *Alta* credits one self-respecting girl, who shows all the instincts of a lady, with saying that young women of her class will do house service in preference to working in shops if the following guarantees are given: 1. A definition of what a day's work means, and payment for all over-time required, or certain hours of absolute freedom guaranteed, especially where the position is that of child's nurse. 2. A comfortably warmed and decently furnished room, with separate beds if two occupy it. 3. The heaviest work, such as carrying coal, scrubbing pavements, washing, etc., to be done by others, with a consequent reduction in the wages. 4. No livery if there is a feeling against it. 5. The privilege of seeing friends in a better part of the house than the kitchen, and security from any espionage, whether the visitors are male or female.

For the Last Time.

The last Sunday evening that Henry Ward Beecher preached in his church, he lingered a little while after the congregation had retired to listen to the organist and two or three members of the choir who were practicing the hymn:

"I heard the voice of Jesus say:
Come unto me and rest."

Two street urchins wandered into the building, and one of them was standing in the position of the boy whom Raphael has immortalized, gazing up at the organ. The old man, laying his hands on the boy's head, turned his face upward and kissed him, and, with his arms about the two, left this scene of his triumphs, his trials and his successes forever. It was a fitting close to a grand life, the old man of genius and fame shielding the little wanderers, great in breasting traditional ways and prejudices, great also in the gesture, so like him, that recognized, as did the Master, that the humblest and the poorest were his brethren—the great preacher led out into the night by the little nameless waifs.

This incident moved John W. Chadwick to write these verses, which appear in the *Christian Union:*

Plymouth Church, Feb. 27, 1887.

The preacher's evening task was done;
The crowd had gone away;
But something pleaded with his heart
A little while to stay.

For him alone the organ pealed;
For him alone the choir
Sang soft and low, in sweet accord,
The song of his desire:

"I heard the voice of Jesus say,
'Come, weary one, and rest.'"
What prophecy for him was there
How little any guessed!

As lovingly he lingered there,
Ere yet the music died,
There came two urchins from the street
Unfearing to his side.

The old man bowed, and lifting up
A soiled and homeless face,
He kissed it as a mother might,
Then turned to leave the place.

On either side the urchins trod;
And on the left and right
A loving hand on either pressed:
So out into the night.

Out, little thinking as he went
That never any more
His willing feet should inward go
That sacred threshold o'er.

And it was well: more fit good-by
No genius could devise;
No thoughtfulness of loving hearts
No wisdom of the wise.

The "little ones" had always been
His chiefest joy and care:
With them alone let him go forth—
And God be with them there!

And down the future he shall go,
And through the enfranchised land,
A loving smile upon his lips,
A child on either hand.

WAITING FOR THEIR SON'S RETURN.—Sorrow was weighing on the hearts of two gray-haired old people. Silas was their idol. Through the long four years they had heard no tidings. Every night and morning of this tedious waiting, the old man, after his usual formal petitions (which embraced the whole human race, and then the heathen whom he always annexed separately), prayed not formally, nor in the Bible phrases, but in his own homely dialect; in words not chosen but coming directly from his heart, that his son, their son, should be returned to them. Now, since the return of their son's comrades, each night and morning the old couple rose from their knees with tears glistening in their faded eyes and trickling down their withered cheeks; rose and went to the window in the morning, or opened the door at night, to see if their prayer had been suddenly answered. The old man had lately taken to sleeping downstairs in the front room, "So I kin hear the boy 'fore he gets to the door, an' open it fur him," he said. Frequently during the night, which is so long to old people, the poor father would go to the door and look out; and if the noise of opening and shutting happened to awaken his wife, she would call down to him in her shrill little voice, "Is that you, Sam?" To which the invariable reply was, "Yes, Sally; I was jes a lookin' ef I could see anythin' of the boy; but there aint nuthin'."—*G. J. Preston, in the American Magazine.*

"WHISKY will never hurt anybody who lets it alone," is the foolish answer often made to men who appreciate the full terror of the curse that is upon us. Facts corroborate the dispatches published in the Chicago papers, which charge drunkenness upon the guilty crew of the freight train on which a score of human beings were dashed to a horrible death in the recent Baltimore & Ohio disaster. It is but one more of a million proofs that the statement is an egregious falsehood. Whisky more often hurts the innocent than the guilty.

SURE TO RISE.—"I've got a little money to invest, and I want your advice."

"In regard to what?"

"I want to invest in something that is sure to rise."

"Buy thermometers."

Verses.

[Written for the Rural Press by E. E.]

CHARACTER.

Build up thy pyramid higher;
Each step thou shalt build up entire
Will show to thy truth-seeking eyes
Life's broader horizons and skies.

THE REPROOF.

I say it for heartfelt truth,
The word that gives us pain
Is often the needed lash,
That rouses our might and main.

Woman's Work.

[Written for the Rural Press by Jewell.]

This question of woman's work is a deep and serious one, worthy of profound thought, deep reflection, and much experience. After years of the latter, much study and observation, I have arrived at what seems to be the true solution of the problem, contained in the one word "co-operation." Then each of us can have the opportunity of doing that part of the labor congenial to the taste, yet equally important for the general welfare, comfort and enjoyment of the whole.

I admit the present state of society is not ripe for this "Utopian" idea—especially is this true of the farmer and pioneer; so I will not elaborate my pet idea now, but state a few facts relative to the possible elevation of woman's work from drudgery into comparative ease. Until a year ago I did not believe such a wonder existed as a refined, lovable, educated woman who really enjoyed housekeeping in every branch. But I saw her. She was a young mother, too, rearing her little family, busy as a bee, and singing like a lark at her housework. I asked her what part she liked best. "Every bit of it," was her reply; and I believed her as the days went by and I saw her daily sweeping, dusting, cooking and cleaning house all the time. Such a radiant smile as she wore! and the order and neatness of the house left a picture never to be forgotten. I thought then, this is what our homes might be if we all loved housework and cooking. But the fact remains that all do not; then what shall we do about it? I'll tell you—*try to*, if your circumstances in life have placed you where it is your duty to perform such labor.

There are many ways in which our labors may be greatly lessened, and indeed I believe it is every woman's duty to lighten her own burdens and those of others, too, as much as it is possible and consistent to do. Many women double their toil by lack of thought and system. Plan your work, and "make your head save your heels," as the old saying is. Then, too, American housewives do too much fancy cooking, in the way of pies, cakes and puddings. A plain, substantial dinner, well cooked, with its sweet bread, butter and fruit (dried or canned), is much more wholesome, and, with an occasional dainty of pie or cake, etc., keeps the appetite keen to relish such things.

Our home mother must not forget her duty to herself, in spite of the great calls upon her time and labors.

Always take a daily rest and read, which refreshes the body and mind wonderfully. One bright old lady of 80 gives her experience of how to keep young and healthy, in spite of a long life of toil and family cares, by saying that she made it a point to take a daily nap in spite of duties and home cares. This is not always possible with all temperaments; where the brain is active and the body strong, a rest with a book or paper is sufficient, or an hour's writing will often rest the worker as well. Do not overwork, but simplify it; even neglect some rather than become discouraged. Don't make a slave of yourself to your duties, but enjoy the result, if you cannot the labor itself. Bear in mind that a tired cook spoils the food, while a cheerful face and kind word add a spice to the meal nothing can replace. Every person should survey the burdens of life hopefully and cheerfully, and, fitting them to their shoulder, carry them bravely along. Don't try to shirk your part of the world's duties on to other shoulders or desire to carry only those agreeable to you, nor drag them along, as many do, adding more work and of a more bitter kind, too, to bear. Plan it as we will, this work has got to be done by some one. And if that some one does not like to do it, but is obliged to by circumstances over which she has no control, then comes in play self-abnegation or the fitting of the burdens to the brain and shoulders, making our duties, when willingly borne and evenly balanced, but half the weight to carry. This might be termed spiritualizing our duties. Instead of being pulled down by them, we raise them and advance in life with mental freedom and happy self-consciousness.

Los Gatos.

When a fire alarm is rung in Rome, "the firemen draw an engine to the fire, while grooms lead the horses behind the engine." No wonder Nero had plenty of time to fiddle.

Young Folks' Column.

The Four-Leaved Clover.

[Written for the Rural Press by Aunt Susie.]

Once upon a time a little girl named Goldenlocks was sitting on the doorstep of her home, just at sunset. She had been reading a book of fairy stories, and as she finished it she said: "O dear! how I would like to see the fairies dance just after sunset, as it tells about in this book. O dear! O dear! I wish so much that I could!"

Just then she heard something that sounded like a low laugh, looked around, and then she saw a fairy—a wee little bit of a creature. She was all dressed in white. Goldenlocks was much surprised, but kept very still, for fear she would frighten the fairy away, who in a moment came up to Goldenlocks and said:

"I just heard you wish you could see my little people dance after sunset. Now I know you are a good little girl, only you are not very patient. I have often watched you when you did not know it, and I'll tell you how you can see us dance to-morrow, if you have patience to do what I tell you. When it is nearly noon, you go out to the clover-field and hunt for a four-leaved clover, and if you find one just as the town clock strikes 12, you keep it, and then when the sun gets nearly down behind the hill, and the sky is all gold and red, you go to the clover-field again with the four-leaved clover in your hand, then you pick four pink clover blossoms, and pull out all the little pieces, one by one, and eat the honey from the end, and if you do not miss one, just as you throw away the stem of the last one we will all come up and dance;" and before Goldenlocks could say "thank you," the fairy was gone, but she said to herself, "I'll do it, I will be patient;" so then she went in the house and told her mamma all about it, and dreamed all night of the dear little fairies. The next day she went to the clover-field, and hunted, and hunted, till her patience was nearly gone; then, just as the big clock in the church steeple struck 12, she found a four-leaved clover; she fairly danced with delight, and ran home with it. She was so excited she could hardly wait for the sun to set, but at last she saw the good old faithful sun getting very near the hill, behind their house, so out she ran to the clover-field again, and stood there with her hat off, and her golden curls flying in the cool evening air, and her bright blue eyes just dancing with delight. She picked four pink clover blossoms, and began to pull out the little stems, one by one, and eat the honey on each, but it was slow work for a little girl who was so anxious to see the fairies dance, and more than once she said, "O dear! it takes so long." But she persevered, and at last, just as she threw away the stem from the last blossom, the sun went down behind the hill, and the sky was a blaze of red and gold; then up came a host of little fairies, and they all danced in such a pretty, graceful way. Goldenlocks stood as still as a mouse, and then all at once, away flew the fairies, all but the one who spoke to her before; she came up to her again and said:

"Well, little girl, how did you like it? I did not tell my people you were here, because they don't like to have me let you big people see them, but you were so anxious to see us, I could not resist letting you. I am glad you were so patient about the blossoms. Run home now and keep on being a good, gentle, patient girl; kiss me and I must go." So Goldenlocks bent down and kissed the tiny creature before her, and said, "I thank you very much for the pleasure you have given me, and I will be more patient." Then away flew the fairy, and Goldenlocks ran home and told her mamma all about it, and said: "Now, mamma, I really will try to be more patient and not fret when you want me to learn a long lesson, or pull the weeds from your flower-beds. I thought I never should get all those little pieces pulled from the clover blossoms, but I am so glad I kept on, for now I have seen the fairies dance, and I am going to be as patient as you can wish me to be." And she kept her promise.

FLORA AND HER PETS.

Luck vs. Labor.

A king once said to his minister: "Do you believe in luck?"

"I do," said the minister.

"Can you prove it?" said the king.

"Yes; I can."

So one night he tied up to the ceiling of a room a bag containing peas mixed with diamonds, and let in two men, one of whom believed in luck and the other in human effort alone. The one who believed in luck quietly laid himself down on the ground; the other after a time found the bag, and feeling in the dark the peas and stones, ate the peas and threw the diamonds to his companion, saying: "There are the stones for your idleness."

The man below received them in his blanket. In the morning the king and minister came and told each man to keep what he had found. The man who believed in trying got the peas which he had eaten; the other got the diamonds.

The minister then said: "Sir, there may be luck, but it is as rare as peas mixed with diamonds; so let none hope to live by luck."—*Chatterbox.*

Domestic Economy.

A Lesson at the Boston Cooking School.

No doubt our readers will be interested in a part of a report given by the Boston *Globe* of one of Miss Maynard's lectures in the Boston Cooking School. The lecture was accompanied by a practical demonstration—that is, by actually preparing the dishes described:

Sponge Cake.

Beat yolks of five eggs to a stiff froth; add slowly one cup powdered sugar, beat well; add one saltspoon salt and the grated rind and juice of one-half lemon; then add whites of five eggs beaten stiff and one cup flour. Bake one hour.

The first thing to see after is the fire. Have a very moderate oven, a great deal more so than for any cake in which butter is used. The cake should be well risen at the end of 15 minutes and browned at the end of half an hour.

Separate the yolks from the whites and remove the little hard spot or germ from the egg. Measure out the sugar and then sift it, adding to yolks slowly as directed. Granulated sugar, the finest, will do perfectly well for all ordinary cake, but the powdered should always be used for sponge cake.

Be sure to beat the yolks very well before adding the sugar, having them thick and light colored.

In adding the flour, put in one-half of the amount, then put in the whites of the eggs and add the rest of the flour. If all the whites are put in at first the whole will be made too thin; if all the flour is put in at first it will make too thick a dough to cut the whites into successfully. Bake one hour.

If the oven is too hot, a crust will form on top of the cake, and it will not rise any more. The test for a cake being done is to have it shrink away from the sides of the pan. This never fails except, perhaps, in a very large loaf of cake. The cake may be moved about in the oven if necessary, but be careful in opening and shutting the oven door to do so quietly, so as not to jar the cake, as this will make it fall oftentimes.

In reply to some questions on the subject, Miss Maynard said she considered sponge cake the most difficult to make. As to where the secret of success lay, she thought it was in great care throughout, especially in beating the yolks and in baking the cake.

In cutting sponge cake or any other cake that is warm, cut through the crust only and then break the rest. Cutting all the way down through would make it heavy and tough.

This is the same rule which is used for lady-fingers, only for the latter it must not be beaten so much.

Fried Muffins.

One egg, 1½ cups sugar, three-fourths cup milk, 1 teaspoonful baking-powder, 1 saltspoon salt, flour to make a stiff batter. Mix salt and baking-powder with a little flour. Beat the egg, add the sugar, and beat again. Add the milk and flour to make a stiff batter. Drop from the spoon into hot fat.

These are the old-fashioned pancakes which our grandfathers used to eat with cider. They seem to need some acid with them, say jelly or some sharp sauce.

In frying them the fat should not be so hot as in the case of croquettes, which are cooked already and need only to be browned.

Have the fat about hot enough to brown a bit of bread while one is counting 60. Take up a spoonful of the mixture and scrape the bottom with a knife held in the right hand so none of the mixture will fall into the kettle; then scrape out the spoonful into the hot fat. Take care not to have too large a spoonful, as they swell a good deal in the cooking. Test by sticking in a fork. Serve hot and plain, or with sauce, as indicated above. Very nice for breakfast.

Potato au Gratin.

Cut six cold boiled potatoes into dice. Make a sauce by melting two tablespoonfuls butter, add two tablespoonfuls of flour and pour on slowly one cup white stock and one cup milk; season with salt and pepper and add four tablespoonfuls, heaping, of grated cheese.

Put a layer of potato into a baking pan, and pepper; then some of the sauce, more potato, and so on until all is used. Sprinkle with crumbs and brown in the oven.

Let the crumbs used be buttered. Put all into a dish in which it can be served when done, as it must not be taken out of the dish in which it is cooked. A porcelain dish to go inside a silver or plated cover may be used, or an ordinary white or yellow "nappy," which may be hidden by a pretty fringed napkin folded about it.

Bread Griddle Cakes.—One pint milk, 1 cup stale breadcrumbs, half teaspoonful salt, 1 egg, 1 teaspoonful baking-powder; flour to make a thin batter. Soak bread in the milk 1 hour, then beat it smooth; then add beaten yolk, flour, baking-powder and salt, and beat again. Then add the white of an egg beaten stiff.

The Week.

Though California gardens yield flowers for every day in the year, there are seasons of especial activity in bloom, and we are now enjoying such a period. The gardens are acres of buds and blossoms. Trains and boats approaching the city are fragrant and beautiful with flowers in buttonhole and corsage, flowers in handfuls and basketfuls — flowers by the bunch, flowers by the bushel. It is not a bad idea which some one has proposed that every town in the State hold a floral fair, and every local newspaper give a full report of it, in the hope that the outside world may begin to realize how great are our resources of bloom. This is a project for the future. Meantime Los Angeles is making a grand display during this, the second week of her floral festival. Oakland has gathered a collection this week which wins much praise. Santa Barbara, San Jose and Santa Cruz will all follow, and if other places are prompted to act this season, by all means let it be done. We hope to find in next week's RURAL space for accounts of the Los Angeles and Oakland exhibitions.

The week has been blessed with new showers. North and south the refreshing has come and everywhere has it been enjoyed. The State and the people smile with confidence of great possessions, as greeting is extended to the thousands of strangers now within our borders.

The Nation's Grog Bill.

We once heard a reformed inebriate, who had become an active temperance worker, say that he had drank liquor enough to float a good-sized ship. Of course, the remark was intended to be taken with considerable abatement, but the statement could hardly be regarded as a hyperbole, that the aggregate amount of intoxicants consumed by the people of the United States the last 25 years would make a lake big enough to hold and float our navy.

In the quarterly report of the chief of the Bureau of Statistics, the consumption of distilled and malt liquors and wines, and estimates made upon the best recognized authority, are dwelt upon at considerable length. In round numbers the consumption of distilled spirits, domestic and imported in this country, is shown to have increased from 43,000,000 gallons in 1840 to 72,000,000 in 1886; of wines, from 4,800,000 to 22,000,000, and of malt liquors from 22,000,000 to 642,000,000. An elaborate statement made by F. N. Barrett, editor of the New York *Grocer*, by request of the chief of the Bureau, is given in the report, which among many other things discloses the fact that the present average expenditure in this country per annum for malt and spirituous liquors at retail is $700,000,000. The drinking population is estimated to be, in 1886, 14,954,417, making the average expenditure per capita $451.90. From the known conservatism of the *Grocer* on the temperance question, these figures may be regarded as more than likely a little under what a rigorous arithmetic would make.

But this is only the direct expenditure, and does not represent the cost of crime, pauperism, disease and insanity which this consumption of liquor annually entails upon the people of this country.

And yet what are all these vast statistics in comparison to the ghastly wrecks strewn along the shore of this gulf of fire? Take but one item alone from the mighty census of woe and misery. Sixty thousand lives are yearly destroyed in the nation from the use of strong drink, 100,000 men and women are sent to prison, and 200,000 children bequeathed to the poorhouses and charitable institutions. Suppose a bell could be made large enough and swing high enough to be heard over all this land, and it could be tolled at the death of each drunkard, its mournful dirge would ring in our ears, day and night, the year round. Its sepulchral tones might arouse the whole community to a realization of its responsibility for so many untimely and frightful deaths. It might cause every one to pause and ask the question whether he had any personal agency in this horrible work of blasting the hopes and lives of so many of our fellow-creatures. But no such bell tolls its mournful requiem upon the air, and the storm of fire sweeps on, filling brothels and bridewells, State prisons and State lunatic asylums, or breaks out ever and anon in the maniac yell of mobs, murder, robbery, arson—all sorts of crimes, vice and mischief.

INTERSTATE COMMERCE.—Nothing startling has been disclosed during the week in the progress of the Interstate Commerce law. There is much discussion, but no definite results stated yet. Perhaps another week will tell more. The situation of the wool-shippers has been simplified by the offer of the Pacific Mail in making a rate of $1.50 per hundred pounds, via Panama to New York, on baled wool. No response has been received by the wool committee to their telegram addressed to the Interstate Commission.

DEATH OF UNIVERSITY REGENTS.—Following close upon the death of Joseph W. Winans comes the summons to Prof. William Ashburner, who died on Tuesday night of this week. These gentlemen have rendered long and faithful service as regents of the State University and have been otherwise prominent and estimable citizens. Governor Bartlett has appointed Albert Miller, of Oakland, to complete the unexpired term of Regent Winans.

The Wheat Gamble.

We do not profess to be able to see through all the schemes and designs underlying the present gamble in wheat which force prices far above a figure which legitimate conditions seem to demand, but we are sure that the experience through which the market is passing is likely to work evil. To bull the market now, when there is little to sell by the growers, will be to invite reaction and demoralization later on when the new crop comes in. Those who have held wheat and take advantage of present ruling rates to unload will do well, and the existing plan of loans on wheat has probably encouraged some to hold on and thus be benefited; but the effect in the aggregate will be, we fear, a disheartened market and a strong bear movement when the new wheat is pressing forward for sale. We have always claimed that grain gambling, that is, manipulating values without any reference whatever to demand and supply, present and prospective, which are the legitimate factors in market prices, is an evil both to producers and consumers. We are glad that public sentiment is growing against it and that some progress is being made in legislation to prohibit its worst features. Where can be the benefit in a movement which blocks the export of wheat and holds the ships with sails idly flapping in the harbor, when they should be driving full cargoes to distant ports? Who is advantaged when our millers are obliged to seek wheat at a distance, or in default of that are forced to shut down or operate on fractional time? The secret of success, when crops succeed each other with the regularity which characterizes them in this State, is in the free outward movement either as wheat or flour, so that our warehouses may be well cleared out of the old crop by the time the new wheat comes to tide-water. It is such movement which will give the best average success to all producers and to manufacturers and laborers. Whatever interferes with this is planned for some narrow advantage, though it may not be possible to fully descry it. It may be for a trap into which one lot of gamblers aim to lure another, or it may be for a snare for the market itself, and designed to work hardship to producers before the game is fully played out. It matters not which, the result is the same. Legitimate trade is demoralized, wise speculation is left in the lurch, the producers, consumers and conservative investors are all made gammon of. The whole business should be made impossible. It is outrageous to gamble with a people's food. It should be made criminal.

A FLORAL FAIR is to be held in San Jose, under the auspices of the Horticultural Hall Association, beginning May 4th. A long list of the ladies to whom tables and rose-wagons have been assigned is already published. A lady having charge of a wagon may select any pattern she chooses—wheelbarrow or baby-carriage, if she will—and adorn it to her taste; but only a single variety of rose is to be used in decorating any one vehicle. It is intended to have as many kinds of roses represented as possible, and that every evening there shall be a procession of little girls, each drawing one of the rose-wagons and dressed with roses to correspond.

SANTA BARBARA'S FLOWER SHOW did not come off at the time appointed. The high winds had injured many of the choicest roses; and so the managers thought it better to postpone the exhibition for a week or two, and allow the younger buds to come into blossom. Then, too, the occurrence of the Los Angeles festival at that time made it awkward for some who desired to attend both displays; and on that account the people were more willing to wait awhile.

PACIFIC RAILROAD COMMISSION.—The President has appointed as commissioners to investigate the affairs of the Pacific railways under the act passed by the last Congress, Robert T. Pattison, of Pennsylvania, E. Ellery Anderson, of New York, and David T. Littler, of Illinois. The commissioners met in Washington April 19th, and intend to begin their work at once.

MECHANICS' FAIR.—The Trustees of the Mechanics' Institute announce that the 22d Industrial Exposition will open at the pavilion Thursday, Sept. 1, and close Saturday evening, October 8.

Fruit Marketing at the East.

There have been during the week two meetings in Sacramento, in relation to this year's marketing of California fruit at the East. The Fruit Union directors met April 14th, the following being present: A. T. Hatch, John Markley, L. W. Buck, P. E. Platt, H. C. Morrell, G. D. Kellogg, Webster Treat, H. Weinstock, and H. W. Meek. President Hatch stated that it would be impossible for him to undertake the Eastern business of the Union, and R. B. Blowers, of Woodland, was chosen Eastern manager. Mr. Blowers has accepted the trust, and will start eastward at once. In our opinion the selection of Mr. Blowers is wise. He has had much experience in shipping fruit to the East and selling it there. He knows how fruit ought to be packed, and our shippers will feel confident in his expertness, and in his honor and honesty that their interest will be well looked after by him.

The manager was instructed to appoint agents immediately at Omaha, Kansas City, St. Louis, St. Paul, Boston, New York, Philadelphia and Baltimore. It was left to his discretion whether to open agencies in Cincinnati, Louisville, Buffalo, Cleveland, Indianapolis, Pittsburg and New Orleans. No agents are to be appointed west of the Missouri river, excepting in the cities named.

It was decided to adopt the auction plan of disposing of fruits for New York, and if successful there, then to adopt the plan for Philadelphia, Boston and Baltimore. The Eastern manager was instructed to be in New York on the arrival of the first shipment of fruit, and to report to the directors the success of the auctions.

On April 15th there was a meeting of the California Fruit-Growers' Association in Sacramento, at which the president, R. D. Stephens, made a long address reviewing the situation. Mr. Stephens read many replies to circulars he had sent out to the fruit-growers, asking their opinion as to whether it is preferable to send their fruit East or sell it at home. About 90 per cent of the answers favored selling it at home. A long discussion took place as to whether the organization should continue in existence. It was decided in the affirmative, and the old Board of Directors was re-elected; but it was thought advisable not to take any action as an organization at present to antagonize the plans mapped out by the Fruit Union for the present season.

Sericulture.

The State Board of Silk Culture held its usual monthly meeting last Saturday. Present, Messrs. Trumbo, Carter, McDonald, Sellers, and the Secretary, Mrs. Rienzi.

It appears that the demand for mulberry trees has outrun the supply; but as fast as cuttings can be got, orders will be filled. The silkworms lately hatched are lively and hungry.

The Executive Committee have issued a card cordially inviting every one interested in the development of this industry to visit the rooms of the board, where can be seen all the different operations, from the hatching of the egg, feeding of the worms and spinning of cocoons by the silkworm, to the reeling of the silk ready for the manufacturer.

The office and filature are open from 10 to 4 o'clock, at No. 21 Montgomery avenue.

Since the above meeting, it is announced that half a million more unhatched eggs have been received by the board from Italy, and will be distributed free to all who desire to raise cocoons, provided the applicants have mulberry leaves enough to feed them on. Inquiries from New York merchants have also been received as to the amount of stock silk on hand. The samples sent East are reported by the inquirers equal to any imported silk.

WILL THERE BE TOO MUCH FRUIT?—The State Horticultural Society at its next meeting (which will be held on Friday, April 29, at 1 o'clock, at Irving hall, 139 Post street, S. F.) will discuss the question, "Will there be overproduction of fruit in California?" W. T. Blackwood was requested to open the discussion on the affirmative, and A. T. Hatch on the negative. This is a question of much importance and all possible light should be thrown upon it. All fruit-growers are invited to attend the meeting.

Semi-Annual State Convention of Fruit-Growers.

Address by Prof. C. V. Riley.

[Editorial Correspondence.]

The fruit-growers of California met in annual convention in Riverside on Monday, April 11th, under the auspices of the State Board of Horticulture. This board is composed of nine members, two of whom are appointed from the State at large and the remainder from districts. It is now constituted as follows:

Elwood Cooper, president, Santa Barbara; A. Block, Santa Clara; Gen. M. G. Vallejo, Sonoma; Dr. Edwin Kimball, Haywards; W. M. Boggs, Napa; A. S. Chapman, San Gabriel; H. C. Wilson, Red Bluff; W. M. Williams, Fresno; N. R. Peck, Placer county.

The board was originally organized under the old viticultural law, under which it acted four years. In 1883 a new law went into effect, under which it was reorganized as an independent commission. Its objects are the promotion of horticulture in the State, its members being appointed because of special qualifications for the work, which they do gratuitously. Although the board disburses considerable of the State money, they themselves receive only sufficient to cover actual expenses.

J. Chester, of the *California Patron*, was appointed as acting secretary, the regular official, Col. A. H. Webb, having recently deceased. The board has a chief executive officer under the title, "State Inspector of Insect Pests." This office is now filled by W. G. Klee, of Berkeley, who is present at the convention.

Among the distinguished gentlemen present at the meeting of the board is C. V. Riley, U. S. entomologist, from the Department of Agriculture, Washington, D. C.

The permanent office of the board is at 40 California street, San Francisco, where the secretary is always present to furnish information and documents for the use of the horticulturists of the State. The board is now having published some very valuable matter for gratuitous circulation among the fruit-growers. It will include, among other plates, four colored plates of scale insects. These publications will contain proceedings of the board, inspector of fruit pests, report, etc. Owing to the failure of the Legislature to make necessary appropriations, the publication of this matter is delayed. It is the purpose of the board, however, to print the important portion of it for immediate distribution. The proceedings of the present meeting are also being carefully taken down by a short-hand reporter, and will, in due time, be published in full, with all the essays and debates.

Under the present law the board is required to hold two sessions each year, one being in the fall in the northern or central portion of the State at a season suited to a display of deciduous fruits, and the other at the south end of the State, at a season most desirable for the examination and study of the citrus fruits.

The convention assembled in the Baptist church at 11 o'clock, with the president in the chair, and, in order to give those who would come on the 12 o'clock train an opportunity to be present at the opening, the convention adjourned until 2 P. M.

Afternoon Session.

The convention met in the afternoon at the Pavilion. It being customary to appoint, from the fruit-growers at large, two honorary vice-presidents at each meeting, L. M. Holt, of the Riverside *Daily Press*, and S. C. Evans, of Riverside, were elected to fill those positions. Mr. B. M. LeLong, of Los Angeles, was invited to act as assistant secretary.

The organization having been fully effected, Mr. Cooper, the president, gave a brief statement of the work of the board since its organization. He referred to its previous sessions, and stated that from the expressed wish of prominent fruit-growers of Los Angeles that its next session be held either in San Diego, Santa Barbara or Riverside. He had accordingly, in the hope that the well-known interests of the people of this section in horticulture would lead to a better attendance than was sometimes obtained, arranged for the meeting here. The previous session had brought out valuable information, which was being printed, and would be distributed. It was necessary that the mass of new-comers to this portion of the State should be furnished facts which might save them from making expensive blunders. The insect pests are not being overcome as could be wished. He referred to the presence of Prof. Riley, one of the most prominent entomologists in the country, and stated that he would give us some valuable information at a subsequent session. He urged co-operation among fruit-growers, and hoped an effort would be made to modify the effect of the Interstate Commerce bill.

The president then introduced Mr. H. J. Rudisill, a prominent horticulturist of Riverside, who gave an eloquent and very appropriate address of welcome.

At the conclusion of this address the secretary read a well-written and valuable essay prepared by Mrs. H. H. Berger, of San Francisco, on Japanese fruits.

At the conclusion of the essay Mr. Wilcox, of Santa Clara, suggested that the convention consider the points in Mrs. Berger's paper, and referred to the high character of our fruits exhibited at New Orleans, making special mention of the persimmons there exhibited. They could be grown successfully over the larger portion of the State, and were really a very fine fruit.

Mr. Klee spoke of the fact that most of the Japanese persimmons were grafted on inferior stock, but that we have a better stock upon which to graft in the European persimmon, and that with it we may expect an improvement in the fruit. He had an idea that while the persimmon would grow well in all sections, it would do better in the more humid portions of the State. He suggested that it would be well to experiment with the Japanese oranges in Riverside. Didn't think they would grow of large size, but had excellent points in their favor.

Mr. Klee said the loquat could be grafted on the quince, but did well on its own root. Said the Chinese had better varieties than those with which we are familiar. This fruit could be dried like the fig.

Mr. Starr, of Lugonia, said the persimmon did excellently in the sandy soil of his neighborhood, bearing freely and regularly.

Mr. Holmes thought experience in Riverside had demonstrated the correctness of Mr. Klee's theory, that a more humid climate was preferable for this fruit, although it fruited satisfactorily here.

On motion of Mr. Peck, it was decided to have a social meeting on Tuesday evening, to give opportunity to meet the Riverside people.

An adjournment was made until Tuesday morning, thus giving the members and visiting fruit-growers an opportunity to accept an invitation to take a ride down the avenue, and to visit other portions of Riverside during the afternoon.

Tuesday's Session.

The convention assembled at 9:30 A. M. The first business on the program was the address of Prof. Riley on scale insects. He was introduced by President Cooper in a very off-hand, but happy and appropriate, manner, alluding at some length to the efficient manner in which the professor had conducted the labors of his office, in studying the habits of some of the most destructive insects which have afflicted the farmer and horticulturist, and in devising ways and means to get rid of them.

The professor, on taking the floor, very modestly disclaimed the eulogy which the president had pronounced and proceeded at once with his address, which was full of valuable information, and which, though quite lengthy, was listened to with the most marked attention throughout.

ADDRESS OF PROF. C. V. RILEY.

Mr. President, Ladies and Gentlemen: When I left Washington, it was with the intention of resisting all invitations to speak, as I have been suffering for some time from the effects of overwork and desired quietly to pursue some investigations in relation to insects injuriously affecting fruit culture here and at the same time get rest from exacting office duties. But it was impossible to refuse the urgent appeal of your president, Ellwood Cooper, to address this meeting. I have, however, no formal address to offer you, and simply expressed my willingness to take part in your proceedings and discussions.

The subject announced, namely, "Entomology in its Relation to Horticulture," is one chosen by some enterprising member of your board, and is altogether too comprehensive to be dealt with without more time and more thought than I have had at command. I shall endeavor to confine my remarks to scale-insects, and particularly to what you know as the White scale. This is the insect which undoubtedly most concerns you just now, and I have an elaborate article upon it now going through the press at Washington. This, however, would require two or three hours to read, and I will pass over the purely historical and entomological details and touch only upon such points as will probably interest you.

Nomenclature.

There is no doubt whatever about this insect being the *Icerya purchasi*, of Maskell, and its scientific name is, therefore, fixed. In reference to its popular name, there are several in use, and as between "Australian bug," "White Scale" and "Cottony cushion scale" there is very little choice, and it is, as a rule, useless to endeavor to change popular names that have once come into vogue. So far as they can be changed, however, and with a view of inducing unanimity in the adoption of a single name, it were better to reject all these names and call it the Fluted scale. There are many Australian bugs and many White scales, some of which, belonging to the genus Pulvinaria, equally well deserve that cognomen. Cottony cushion scale is both too long to be acceptable and would likewise apply to the species of this last genus, whereas no scale-insect injurious to fruit or other trees, at present existing in this country, secretes its white, waxy matter in such a perfectly fluted mass as this. The generic term, Icerya, if once popularized like Geranium, Phylloxera, etc., has the advantage of brevity and still greater accuracy.

Geographical Distribution.

Historical evidence all points to Australasia as the original home of this insect, and its introduction from Australia to New Zealand, Cape Town, South Africa and California. Nothing was known or published upon the species prior to the seventh decade of this century, and it seems to have first attracted attention almost simultaneously in Australasia, Africa, and America. The evidence as to whether it is indigenous to Australia or New Zealand, or to both, is not yet satisfactory. The first personal knowledge which I had of it was from specimens sent to me in 1872 by Mr. R. H. Stretch, then living in San Francisco, and all the evidence points to its introduction into California by the late George Gordon, of Menlo Park, about the year 1868, and probably from Australia, on *Acacia latifolia*.

More light is, however, yet needed on this point, as in a recent letter received from Baron von Muller, of Victoria, he claims that it could not have been imported on Acacia into this State, as all the Acacias in the State have been grown from seed. This is a matter upon which I should like to have definite information from members of this body, if such information is extant.

It is at present widely distributed in the State, and a very full account of its distribution kindly furnished to me by Mr. Matthew Cooke, shows that there are some ten infested districts, namely: six in the counties of Marin, San Mateo, Santa Clara, Sacramento, Sonoma and Napa, and four in the counties of Santa Barbara and Los Angeles. I find that it has also obtained a foothold in a few isolated places around San Diego, from which it may yet be stamped out.

Food Plants.

A very long list of plants might be enumerated upon which this insect is either found accidentally or upon which it can live more or less successfully. But the list of plants, especially of trees important to us for their products, which are seriously affected by it, is comparatively limited, and will include the Acacias, Lime, Lemon, Orange, Quince, Pomegranate and Walnut. Some few other trees might be added, and it is particularly partial to the Rose and the Nettle; but it is doubtful whether the species could permanently thrive and multiply to an injurious extent on many other trees than those mentioned.

Characteristics of the Insect.

The genus Icerya was founded by Signoret, a French entomologist, in 1875, being based upon the single species, *Icerya sacchari* (Guérin), which lives on sugar-cane in the island of Bourbon. This species and the one we are now dealing with are the only two species of the genus, and the diagnosis as given by Signoret, and subsequently elaborated by Maskell, of New Zealand, is incomplete and does not include the characteristics of the male.

In the report already alluded to, I have given a very full characterization of the species in all conditions and stages, but the only facts that I need draw attention to on this occasion are, first, that the female undergoes three molts and the male two; *i. e.*, each has one more stage than has hitherto been recognized by entomologists and observers; secondly, that it differs from all other members of its family (Coccidæ), in its extended powers of locomotion in most of its stages; in its extreme hardiness or power of surviving for a given period without food, and in its polyphagous habit, or the ease with which it accommodates itself to so great a variety of plants. These are the three characteristics which most concern you as fruit-growers, and which make it one of the most difficult species to contend with.

Mode of Spread and Distribution.

All young scale-insects are quite active when they first hatch, and most of them at this time are extremely small, and when very thick upon a tree, instinctively, or at least very easily, drop from the terminal twigs and branches. Their specific gravity at this time is so light that they are easily wafted with the wind in their descent. This general truth applies with equal force to the Icerya which is readily carried from tree to tree and from orchard to orchard by the agency of wind, by running water, or by birds or other insects. Another local means of transport not to be ignored, is upon the clothing of persons engaged in cultivating, upon packages, and upon all implements used, whether in cultivating or harvesting the crop. This particular species also has quite a habit of crawling over the ground, and its local spread is very materially enhanced thereby.

It is carried long distances, however, chiefly by high winds, birds, and commerce, and its introduction from one continent to another has undoubtedly been effected by the latter method upon young trees or cuttings.

Natural Enemies.

No bird is known yet to attack this insect in California, and but one is mentioned even in Australia, and that upon very slight evidence. Of predacious insects, a species of Lace-wing, (genus Chrysopa) has been observed to feed upon it, as also the Ambiguous ladybird (*Hippodamia ambigua*). The larva of a little moth, which I have described as *Blastobasis iceryœlla*, is also known to feed upon the eggs. Among the Heteroptera, or true Bugs, quite a number have been found upon the trees infested with the insect, but none have yet been noticed to feed upon it. The most important of its insect enemies are a species of earwig not yet identified, and a number of mites not yet carefully studied.

Of true parasites, none have hitherto been reported, whether in Australia, Africa, or America, but I am glad to announce that two specimens of a minute Chalcid-fly have been bred by me from specimens around Los Angeles and will be described by Mr. Howard, who makes a specialty of the family, under the name of *Isodromus iceryæ*. The genus is new to our fauna, and the probability is that this little friend was introduced from Australia with its host.

Preventive Measures.

Most of the members of this society are doubtless aware that for some four years I was conducting a series of very careful experiments with a view of controlling the scale-insects and other insect pests that injuriously affect the orange trees in Florida. This work was carried on through the instrumentality of Mr. H. G. Hubbard, and the Department of Agriculture has published a special report prepared by him upon this subject. All that is said in that report in reference to the value of preventive measures against the scale-insects of that part of our country will apply with equal force here in California.

The value of cleanliness; of thorough cultivation; of pruning judiciously so as to get rid of all dead wood, open the top of the trees to the light and to the sun, and facilitate the spraying of the trees, need scarcely be emphasized. There may be some difference of opinion as to the value of pruning, while different kinds of pruning, or no pruning, will have their advocates here as they have had elsewhere. The Orange makes, naturally, a very dense head, and in the moist climate of Florida, where they have a much larger average of shade, cloudiness, and moisture than you have here, judicious pruning has all the advantages stated, and whether needed or not in California for the purpose of more fully ripening and maturing the fruit, I am quite satisfied from what I have seen that it is just as much needed to facilitate proper spraying of the trees and to prevent overproduction.

Some years ago, and prior to the discoveries resulting from the investigation in Florida just referred to, the inadequacy of most washes caused many of the orange-growers of that State to cut back their trees most rigorously, leaving little more than the main trunk, in the hope of thus being able to kill out or exterminate the scale-insects that troubled them there. I find that many of your orange-growers are going through the same sad experience and resorting to the same sad means. It is a pity to find men thus re-enacting a farce which has been proved in another part of the country to be quite unnecessary. Such wholesale lopping of limbs requires much labor, and even with the greatest care, which is seldom bestowed upon it, the tree receives an immediate and material injury, and is destined to suffer still more in years to come. Moreover, this radical means often proves futile so far as the results aimed at are concerned, and unless the greatest precaution is taken to properly cover and heal the stumps and to absolutely kill all the insects upon the remaining trunk, as well as those upon the severed branches and the ground, the new growth will soon be as effectually infested as was the old. Many of your own growers have thus lopped or are now cutting back their trees in a very blind way and without the precautions here indicated, on the popular but erroneous supposition that without such precautions they will get rid of the troublesome scales.

The value of shelters in the form of surrounding trees and windbreaks is, I am sure, just as appreciable here, if not so much to protect from frost and winds, fully as much to protect from infection from scale-insects. A row, or tall hedge of coniferous trees, such as your cypress, upon which the scale-insects will not thrive—or, better still, a belt of the same—will

often serve as an effectual screen to prevent the young insects from being carried from an infested to an uninfested grove.

Preventing its Introduction.—But, before passing this subject of preventive measures, I must not omit the importance of any effort looking to preventing the introduction of this insect from one section of the country, or from one neighborhood to another. No insects so easily bear transit as these scale-insects, and it is eminently true of this particular Icerya.

All the worst species from which they suffer in Florida have been introduced from abroad. Their Long scale (*Mytilaspis gloverii*) was introduced about the year 1835. Their Chaff scale (*Parlatoria pergandii*), from Bermuda, some 20 years later, and their Red scale (*Aspidiotus ficus*), from Havana in 1879.

We have already seen how this Icerya was introduced into your State from Australia, and the next worst species which you have to deal with, namely, your Red scale (*Aspidiotus aurantii*), was likewise introduced, so far as the evidence goes, from the same country.

To enumerate merely the different species of insects destructive of your fruit interests that have been introduced from other parts of the country or from other parts of the world would consume too much time, and I cannot attempt to do so. But I would lay stress upon this conviction which has forced itself upon me after a pretty extended experience in all parts of the country, namely, that however much you should encourage all co-operative efforts to prevent such transferring and spread of injurious pests, they cannot be fully exterminated when once they obtain a foothold, and in the end each individual fruit grower must depend on his own efforts.

Remedies.

It follows without saying that what we should seek in any direct remedy is, first, perfect killing power, or, to be more exact, perfect insecticide quality associated with harmlessness to the tree; second, reasonable cheapness.

Different Washes.—I will not detain you with any general remarks on the subject of insecticides, because it has received full attention in my official reports. Dry insecticides have been found, in the main, unavailable here, and we must depend upon washes or materials in solution that may be sprayed upon the tree. Here, again, I would remind you of the careful and extended experiments made by Mr. Hubbard in the orange groves of Florida with a view of solving the important question as to what is, on the whole, the most satisfactory liquid application, cheapness and efficiency considered. Carbolic acid, creosote, sulphurated lime, silicate of soda, sulphuric acid, sulphurate of iron, bisulphide of carbon, and many other materials have been thoroughly tried, as well as whale-oil soap, potash and soda lye and their various combinations; but in the end nothing proved equal to emulsified kerosene. Whale-oil soap is an excellent wash for destroying some insects upon some plants, but it fails to kill the eggs of our scale-insects, so that, however good it may be for scrubbing the trunks and branches of a tree, I cannot conscientiously urge it as, on the whole, satisfactory, particularly as it is known to stain the fruit, and because of the many different grades, varying in their effect and in their value, which are upon the market. Potash and soda lye injure the tree more than kerosene does and do not destroy the insects as well, admirable though they are as washes in weaker solution for some other purposes. The action of sulphurated lime (flowers of sulphur boiled in milk of lime) is very similar to that of caustic potash.

Notwithstanding the kerosene emulsions, in proper proportions, have proved so satisfactory against the scale-insects of the Orange in Florida, they have, as a rule, failed to win the good opinion of the orange-growers in California. I have always believed the want of success in this State with the kerosene emulsions was due to imperfect preparation of them, or to imperfect application. I was inclined to give some credence to the theory advanced by my old-time friend, Prof. E. W. Hilgard, who is so keenly alive to everything that interests you, and whose services have been so invaluable to the agriculture and horticulture of the State, namely, that the dryness of the atmosphere in California induced a more rapid evaporation of the kerosene, which may partly account for the difference in experience between the Atlantic and Pacific. For these reasons I had long desired to make a series of experiments in California, and finally, last year, did have such a series carried on by Messrs D. W. Coquillett and Albert Koeble. It were difficult to find in the whole State two gentlemen combining in the one instance more care and reliable entomological capability, and in the other more industry, earnestness and enthusiasm, and this I say without desire to flatter, but as evidence that their experiments, so far as they went, were trustworthy—in fact, I may say, the most careful and thorough that have hitherto been made. These experiments extended over a period of three months in the spring and three months in the autumn, and the detailed reports which these gentlemen have made will be published in connection with my forthcoming annual report. They show that the kerosene emulsions must still be placed at the head of the list of washes, not only for ordinary scale-insects, but for this Icerya or Fluted scale. Among the different substances thoroughly experimented with were caustic potash, caustic soda, hard and soft soaps, tobacco, sheep dip, tobacco soap, whale-oil soap, vinegar, Paris green, resin soaps and compounds, and so on. It is impossible to give even a digest of the very many experiments, and the varying results obtained with the different washes. It suffices to say that the kerosene emulsion diluted with from eight to ten parts of water was found to kill all the eggs as well as the old females, and that, even when used still stronger, it left the tree uninjured. Mr. Coquillett reports with reference to the much-praised caustic soda, that it has no effect on the eggs of this scale even when applied so strong as to burn the bark and kill all the leaves. Similarly, the whale-oil soap does not kill the eggs directly, though it may harden the egg-mass so as to prevent the hatching of a large proportion of young larvæ.

Resin Soaps.—Mr. Koeble, experimenting through August, September and October, found similarly good results from the kerosene emulsion, but that the crude petroleum, although much cheaper, was more apt to injure the tree. His attention was, however, directed mainly to the preparation of resinous soaps and compounds on account of their greater cheapness. He succeeded in making a number of these mixtures which, when properly diluted, need not cost more than one-half to one cent per gallon and which produced very satisfactory results, killing the insects or either penetrating or hardening the egg masses so as to prevent the hatching of the young. One of the most satisfactory methods of making a resin soap is to dissolve one pound caustic soda in 1½ gallons water to produce the lye; then dissolve 2 pounds resin and one pound tallow by moderate heat, stirring in gradually during the cooking one quart of the lye, and then adding water until you have about 22 pints of a brown and thick soap. This will make 44 gallons of wash, costing less than one-half cent per gallon.

There is some slight difference between the experience of Mr. Koeble and Mr. Coquillett as to the value of soap washes, and the greater success which the former had with them as compared with the latter was probably due to the fact that his experiments were made during the dry or rainless season. The great point of interest, however, in these experiments is that they confirm in a remarkable manner the experience had in Florida. And I think you will agree with me that they justify the opinions which I have expressed in official writings. Such observations as I have been personally able to make during my brief sojourn among you have greatly served to confirm me in those opinions, and while the resin soaps experimented with by Mr. Koeble are a valuable addition to our insecticides for the scale-insects, I find the experience in Florida repeated here, and all the more satisfactory washes have kerosene as their effective basis. There has been, however, a very great waste in applying it, and it is in this direction that reform is most needed.

The fact cannot be too strongly urged that in the case of this Icerya, as of most other orange-feeding scale-insects, it is practically impossible, with the most careful and thorough spraying, to reach every one of the myriads on the tree. Some few, protected by leaf-curl, bark-scale or other shelter, will escape, and with their fecund progeny soon spread over the tree again if left unmolested. Hence, two or three sprayings, not too far apart, are far preferable to a single treatment, however thorough. And this is particularly true of the pest we are considering, which lives on so many other plants, and which in badly infested groves is crawling over the ground between the trees.

Value of Kerosene Emulsion.—It is now the custom to use the time of a team and say two men for 15 or 20 minutes or more and 30, 40 or 50 gallons of liquid on a single medium sized tree. In this way the tree is sprayed until the fluid runs to the ground and is lost in great quantities, some growers using sheet-iron contrivances around the base of the tree in order to save and re-use the otherwise wasted material. Now, however much this drenching may be necessary, or has come into vogue, in the use of soap, and potash and soda washes, it is all wrong so far as the oil emulsion is concerned, as the oil rising to the surface falls from the leaves and wastes more, proportionately, than the water.

The essence of successful spraying of the kerosene emulsion consists in forcing it as a mist from the heart of the tree first and then from the periphery, if the tree is large, allowing as little as possible to fall to the ground, and permitting each spray particle to adhere. It is best done in the cool of the day, and, where possible, in calm and cloudy weather. There has been no morning since my sojourn among you that I have seen the sun rise in a clear sky. Cloudiness has prevailed for some hours after dawn, and in this regard you are favored, as this would be the time of day, of all others, to spray. Proper spraying should be done with one fifth of the time and material now expended, or even one-tenth of that which I have seen wasted in some cases, so that three sprayings at proper intervals of from four to six weeks in spring and summer will be cheaper and far more satisfactory than one as ordinarily conducted. In this particular, neither Mr. Coquillett's nor Mr. Koeble's experiments were entirely satisfactory, as I was too far from the field to permit of the detailed direction necessary.

I cannot emphasize the fact too strongly that it is practically impossible to eradicate, by any system, every individual insect and egg upon a tree in one spraying. It is almost futile to attempt to do so.

Improved Wash Recommended.—Let us now see whether the kerosene emulsion, pure and simple, can be improved upon by the addition of any other material. It is plain to be seen from the circulars and documents, both official and unofficial, that have been published in the State and distributed among you, that, in many cases, the proper use of kerosene has been entirely misunderstood. Having already seen that it destroys the eggs of Icerya only when used in the ratio of one part of kerosene to about seven or eight of the diluent, it follows that any lesser amount will give less satisfactory results. Moreover, it is extremely important to prepare the emulsion properly. This has usually been done by the use of milk or of soap, because they are cheap and satisfactory. Raw eggs and sugar and other mucilaginous substances may be used. Experience has shown that the best proportions are two parts of the oil to one of the emulsifying agent, whether milk or soap, *i. e.*, for instance, two gallons of the oil to one of milk or one of the soap-water made by dissolving half a pound of soap in one gallon of water. So long as these proportions are maintained, a large quantity can be emulsified as rapidly as a smaller quantity, and violent agitation through a spray nozzle at a temperature of 100°, and as frequently described in my reports, gives the quickest results.

Take, for instance, the mixture recommended by your County Board of Horticultural Commissioners. You will find that with the soap and wood-potash there are 25 parts of the diluent to one of the kerosene recommended, and there is every reason to believe that the kerosene in this wash might just as well be thrown away, and that it adds comparatively little, if any, to the efficiency of the wash, at least for the Fluted scale. If, on the contrary, we could add to the ordinary emulsion any materials that would give greater adhesiveness, such an addition will prove an advantage. Such we get, to some extent, in the soap emulsion, for which reason it has a slight advantage over the milk emulsion. And after examining the trees treated with resin washes, I am strongly inclined to recommend that these resin washes be used as the diluent to the soap emulsion made after the usual formula. Something similar was tried some years ago by one of my agents in Florida, Mr. Joseph Voyle, who used fir balsam in place of resin, in connection with the oil emulsion, and obtained most satisfactory results. A certain amount of dextrine, or, yet better, flour, if mixed with the wash, would prove valuable for the same purpose.

Again, if permanency can be given to the effect of a wash so that the few insects escaping the first application, or which would hatch out thereafter, would succumb, such addition would be invaluable; and though the arsenites are, as a rule, effective chiefly against mandibulate insects, or those which masticate their food (in other words, although the action of these poisons is mainly through the stomach), yet I happen to know from experience that they have also a direct effect by contact. Therefore I recommend, with considerable confidence, that in this dilute kerosene emulsion there be added a small proportion of arsenious acid, say from 2 to 3 ounces to every 50 gallons of wash. This arsenious acid may be prepared and added in various ways. Probably one of the simplest would be to take half a pound of arsenic to half a pound of sal-soda, boil this in one-half gallon of water until the arsenic is dissolved, and mix this with about 100 gallons of the diluted emulsion. A quarter of a pound of London purple to 50 gallons of the diluted emulsion, or even a still greater amount, would, perhaps, serve the same purpose and be less likely to injure the tree.

I am aware of the danger of making recommendations that have not yet had thorough trial, but I have already made a few limited experiments (and intend making more) which would seem to justify these, and at all events if care be taken not to use too large a quantity of the arsenic no harm will result from it, either to the tree or to those who use the fruit.

Kerosene is not so cheap as the resin compounds, nor as some of the soap and lye washes, but it has this great advantage, that it can be used in much less quantity. It permits a great reduction in the amount of material and the cost of labor. At the rate of 20 cents per gallon wholesale, the effective wash will cost 2½ cents per gallon, and from one to two gallons are sufficient, if properly sprayed, on a medium-sized tree.

Spraying Apparatus.

Just as there is a great wastage of time and money in drenching a tree with kerosene emulsion, so the spraying nozzle most in vogue with you is also somewhat wasteful. That most commonly used is the San Jose nozzle, in which the water is simply forced through a terminal slit in a narrow and rather copious jet of spray. It is the force and directness of the spray which gives this nozzle its popularity under the mistaken spraying notions that prevail, and to this I should probably add the fact that, being a patented contrivance, it is well advertised, and on the market, for somehow or other, people rarely value a gift as much as what they buy, and too often rate value by price. The Cyclone nozzle, or Riley atomizer, as it is called in France, which has proved so satisfactory in the East as well as to my agents at Los Angeles, has scarcely had such trial among you, so far as I have been able to see, as to properly impress its advantages. That originally made and sent out by the late G. N. Milco, of Stockton, was patterned in size and form after one which I sent him, and which was designed to spray from near the surface of the ground.

What I would use for the orange grove, or for trees, is a bunch of nozzles of larger capacity, the size of the outlet to be regulated by the force of the pump. I have witnessed all forms and sorts of spraying devices, and while there are many that are ingenious and serve a useful purpose, I can safely say that there is no form which will produce a spray so easily regulated and altered to suit different conditions, and which is so simple and so easily adjustable to all purposes. Since among you I have endeavored to get a bunch nozzle, such as I would recommend, made at Los Angeles, and the difficulties I have had in getting it made properly illustrate, perhaps, some of the reasons why this nozzle has not become more popular on this coast. All the parts must be well fitted, the inlet must be tangential, and the outlet so made as not to overcome the whirling or clyconic action of the water. The breadth, directness, force, or fineness of the spray are all regulated by the form and size of the outlet, and if a thick cap be used it must be gradually counter-sunk on both sides until the thickness at the outlet does not exceed one-sixteenth of an inch or less. A bunch of four nozzles, one arranged so as to have the outlet distal or from the end of the piping, which may be ordinary gas-pipe, and the other three in bunches, so that the outlet is at nearly right angles, each about an inch below the other, and so placed that they are one-third the circumference of the main pipe apart, will be found, I think, most serviceable in your groves. Such a bunch working from the center of an ordinary sized tree will envelop it in a perfect ball of mist.

For tall trees a more forcible stream might be had from the end by substituting an ordinary jet with a wire extension. This is a recent device first brought to my attention by Mr. A. H. Nixon, of Dayton, Ohio, and for sending a fine spray for a great distance it has advantages. It is simply an extension screwed over an ordinary nipple, the end of the tube being covered with wire netting which breaks up the liquid forced through it. The brass nipple should be about one inch in length, the perforation very true and varying in diameter according to the force of spray desired. The nipple screws on the discharge pipe, and upon a shoulder threaded for the purpose is screwed a chamber or tube about one inch in diameter and three inches long, to the outer end of which is soldered a piece of wire gauze varying in size of mesh to suit the force of pump and the size of aperture in nipple.

Finally, if a service of blind caps and several sets of cyclone nozzle caps of varying aperture are kept on hand, the spraying may be adjusted at will to condition of wind, size of tree, etc

Your worthy president has very well remarked that what we want is not generalization, but hard facts and experience presented in the simplest and briefest manner. If I have dealt somewhat with principles rather than with details, I shall look for your excuse in the fact that extended experience presents such a multiplicity of details as to warn me from entering into them.

Fumigation.

Fumigating trees will always have *cæteris paribus*, some disadvantage as compared with spraying. The mechanism is more cumbersome; the time required for treatment and the first cost in making preparation greater, and these facts will always give spraying the advantage with small proprietors and those who are dealing with young trees. Sulphur fumes have been tried, but they burn the leaves and injure the tree. Tobacco smoke and vapor fail to kill the eggs. Ammonia is excellent, but fails to kill all, though I have known the most beneficial results from the ammonia arising from sheep manure used as a fertilizer in apple orchards. Bi-sulphide of carbon has been tried and with great care in getting the right quantity, its vapor will kill the insects without killing the tree; but its application requires too much time and is fraught with more or less risk to man. This is equally true of cyanide of potassium and of other substances the vapors from which are known to be very deadly to insect life. It will be difficult, therefore, to find a mode of fumigating that will be harmless to the tree and deadly to the insects, and at the same time as rapidly and easily applied as a spray.

Many of you already know that Mr. Coquillett, in connection with Mr. Alex. Craw and Mr. Wolfskill, of Los Angeles, have for some time been conducting a series of experiments which lead them to believe that they have discovered a gas which possesses the requisite qualities. The trees which I have examined that have been treated with this gas, both there, at San Gabriel and at Orange, lead me to the conclusion that they are fully justified in this belief, and several ingenious contrivances have been perfected in Los Angeles county which give promise of great utility and feasibility. Whether the trees are left uninjured, it is perhaps premature to say. That they are affected is evident in some cases, and what the ultimate effect will be time alone will decide. Let us all hope that the promise of this gas will be abundantly fulfilled. Let me add, however, that even if it be found that no solitary insect or egg will escape treatment with this or any other gas, fumigation will yet no more fully exterminate or free the orchard than the proper spraying of the kerosene emulsion, but, for the reasons already stated, will have to be repeated,

"BUT FOR THE 'SMOKE BALL' OUR CHILD WOULD HAVE DIED!"

SAVE YOUR BABIES! A NECESSITY IN EVERY HOME!

READ THE EVIDENCE!

What Mr. and Mrs. Tennant Think of the Carbolic Smoke Ball.

"BUT FOR THE 'SMOKE BALL' OUR CHILD WOULD HAVE DIED."

San Jose, March 26, 1886.

Carbolic Smoke Ball Co.—Gentlemen: It is with great pleasure that we testify to the merits of your medicine, the "Smoke Ball." We purchased one of your Smoke Balls a short time ago, and used it with great success for colds in the head. Consider it the best remedy we ever had in our family. Not long since our little girl had a severe attack of membranous croup, and if it had not been for the "Smoke Ball" she would have died. The first application gave instant relief, and a few applications completely cured her. We consider the "Smoke Ball" a sure cure for croup. Gratefully yours,

F. W. TENNANT,
MRS. F. W. TENNANT.

No. 180 W. San Fernando street, San Jose.

READ THE EVIDENCE!

What Mr. Hammersley says of the "Carbolic Smoke Ball."

"I CONSIDER MYSELF ENTIRELY CURED."

San Jose, March 27, 1887.

Carbolic Smoke Ball Co.—Gentlemen: I have been troubled with catarrh and neuralgia a great many years and have tried a great many different remedies, and have been treated by several so-called specialists—fees from $40 upward, payable monthly in advance—but never obtained any permanent relief. I have also been troubled of late with deafness in the left ear, which had been gradually growing worse. Last January I was induced by a friend to try some of your free tests, and felt a relief after the third inhalation. On January 20th I purchased a "Smoke Ball," and I now consider myself entirely cured of neuralgia and catarrh, and now I can hear as well as any one. I will be happy to indorse the "Smoke Ball" to any person whom you may wish to refer to me. Yours very truly,

A. S. HAMMERSLEY,
577 Ninth St., San Jose.

The **Only Absolute Cure for Catarrh, Neuralgia, Nervous Headaches, Catarrhal Deafness, Sore Throat, Inflamed Tonsils, Bronchitis, Granulated Lids, Weakness of the Optic Nerve, Diphtheria** and **Quinsy.** We have proved that the "CARBOLIC SMOKE BALL" and the "DEBELLATOR" will cure, by the numerous Home Testimonials published, and which we will be pleased to send to any address.

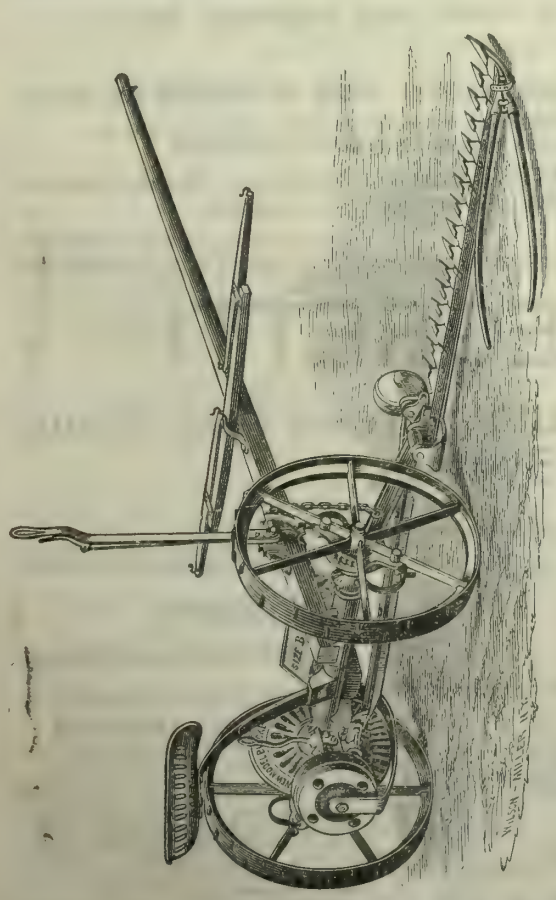
"IT CURED MY CATARRH, NEURALGIA AND DEAFNESS."

THE COMPLETE TREATMENT includes the "Debellator" package, unequaled as a blood purifier, which must be used in Catarrh when there is a dropping of mucus into the throat, biliousness, or where the bowels are irregular or there are stomach or kidney disorders. It should be used in all cases of Catarrh, Asthma, Bronchitis, Hay Fever and Ulcerated Sore Throat. Price of the complete treatment, $5; "Smoke Ball," $3; "Debellator" package, $2. One complete treatment is generally sufficient.

MAIL ORDERS receive careful and prompt attention. State diseases or symptoms in writing, addressing MAIN OFFICE. Complete treatment mailed on receipt of price, $5, and four cents in stamps. "Smoke Ball," $3 (four cents in stamps). "Debellator" packages, $2. Remit by post office or Wells, Fargo & Co. money order, or in coin by Wells, Fargo & Co.'s Express.

[Mention this Paper in Ordering.]

"CARBOLIC SMOKE BALL" CO., 652 Market St. {Cor. Kearny, Rooms 7, 8, 9, 10} San Francisco.



ADRIANCE "BUCKEYE" MOWERS.

MAKE SURE THAT YOU BUY THE BEST MOWER MANUFACTURED.

One that will Outwear two of any other make of Machine.

One that is very Simply Constructed and the Lightest Draft.

One that will do Better Work than any other Mower made.

SOME OF THE REASONS why the Farmers prefer the ADRIANCE BUCKEYE to all other Mowers:

It is the **most simlpe.**
Contains **fewer parts.**
Is the best braced and strongest.
Has fewer and better bearings.
A less number of places for oiling.
All its parts are in sight and easily understood and kept in order by the ordinary farm hand.
It is built on correct mechanical principles.
Has the only perfect double-jointed Finger Bar, which adapts itself to every variety of surface.
There is no downward pressure on the Finger Bar, but a lifting tendency when coming out of a ditch or furrow.
The Knives have a truer and more uniform throw through the Guard Fingers.
Has the most perfect cutting apparatus.
No loose connections or knuckle-joints.
Cuts a swath the full length of the Cutter Bar without driving the off-horse in the standing grass.
It is perfectly adjustable to any work.
All its weight is utilized for power.
The horses draw directly from the axle, and no weight comes on their necks.
It is the **lightest draft.**
It is perfectly balanced.
Easiest to operate.
Excels all others in portability.
The Cutter Bar holds firmly, and flat across the frame.
The most comfortable and the **safest** for the driver.
Only the best material and workmanship are used in its construction.
It requires **fewer repairs.**
Extra parts are more easily obtained.
It has the **longest and best record.**
Its average life is double that of others.

The Majority of the Farmers use it Wherever Sold.

Semi-Annual State Convention of Fruit-Growers.

(*Continued from page 362.*)

In other words, one application, however perfect in destroying insect life, cannot and should not be depended on. The disadvantage about this gas in my estimation is that it is kept so far a secret. We cannot perhaps blame the gentlemen for endeavoring to realize something out of what they consider a valuable discovery that will compensate them for the time they have devoted to the purpose; but I am always suspicious of secret or patent insect remedies. My friend, Mr. Coquillett, perfected this gas after his employment by the Department of Agriculture ceased. But it is a general truth that the moment any person or persons become interested in a patent or in any remedy they desire to control, from that moment their judgment can no longer be depended on as to the value of other remedies. I have been asked why Mr. Coquillett was not continued in the service of the Department for a longer period, and it is perhaps due to the fruit-growers of California and to him to explain why the experiments which he began were interrupted. It had been my desire to have two agents permanently located on the Pacific Coast to carry on the work of my Division here, for I have long felt that your fruit interests, to say nothing of the other agronomic interests of the State, demanded such recognition at the hands of our National Government. It so happens that in my desire to aid other investigations that bear upon the promotion of agriculture, I took part in urging the creation of a Division of ornithology and mammology for the purpose of investigating the habits of birds and mammals so far as they affect agriculture and horticulture. The friends of ornithology were successful in getting that Division created, but were unable to get an appropriation to carry on the work, except by taking it out of the appropriation for the Entomological Division; and during my absence from the country last June, and after all my arrangements had been made for work on the Pacific Coast on the basis of the Appropriation bill passed by the House of Representatives, the amount was cut down in the Senate and part of it given for the ornithological work, thus requiring the discharge of a number of those already engaged and restricting the work of the Department in Entomology.

Bandages Around the Trunk.

There is always danger that a tree once sprayed or disinfected will get reinfested from the insects that have not been reached upon adjacent plants or upon the ground, and which in time may crawl upon the trunk. Any of the sticky bandages used for the Canker-worm will check this ascent, but when the sticky material is placed directly on the trunk it may do more harm than good. It should, therefore, be placed upon strips of tar paper or other stiff paper, tied by a cord around the middle, the upper end flared slightly outward, and the space between it and the trunk filled with soil to prevent the young insects from creeping beneath. Cotton should not be used for this purpose, as birds, for nesting purposes, carry away particles of it which may contain the young insects and may thus help to disseminate them.

Legislation.

Next to the destructive locusts which occasionally ravage our grainfields, no other insect has perhaps been more thoroughly legislated against than this Icerya in California. Indeed, the manner in which the people of this State have taken hold of this insect question and have endeavored by all legislative means to enforce such action on the part of fruit-growers as best subserve the interests of the whole State, is highly commendable. Yet, while much good has undoubtedly resulted, the laws have too often proved inoperative either through the negligence or ignorance of those appointed to execute them, or still more often through the indifference or opposition of individual growers, or unwillingness of the courts to enforce the laws with vigor. And while the greatest co-operation should be urged, and, if possible, enforced, in battling with these insect pests, yet, so far as this particular species is concerned, no human endeavor can now exterminate it from the country. It has come to stay, and nothing has more fully forced itself upon my conviction than that, in the end, with all our laws, each orange-grower must depend upon his own exertions. It is, therefore, fortunate that the pest may be controlled by such individual exertions. While, however, we must admit that it is beyond our power to fully eradicate it from those districts in which it has obtained a foothold, the case is quite different when it comes to restricting its spread, and it is in this direction that wise legislation, and the strict carrying out of the legislative measures you have adopted or may adopt, will be productive of much good.

Recent history has furnished very good evidence of the power of stringent measures adopted by governments, whether to prevent the introduction of an insect pest or to stamp it out when first introduced, and before it has acquired a strong foothold. Several European nations have, in this way, averted, so far, the Grape Phylloxera, and the German Government, on one occasion at least, effectually stamped out our Colorado potato-beetle, which became established in a restricted locality.

The danger which threatens orange-growing districts in this State not yet affected, as well as the orange belt on the Atlantic seaboard, is great, and we cannot too earnestly appeal to the authorities that be for means to employ still greater vigilance to avert it.

Riverside.

What a relief it is to get from a scale-infected region—with the attending evils of blighted and withering growth, smuttiness and unmarketable fruit, into a neighborhood yet exempt from these pests, like this enterprising locality in which you meet! What a joy in contemplating by contrast the bright and cleanly aspect of the trees! And what is there more beautiful in nature than a perfect orange grove at this season, and yet untainted by Coccid or Aphid, or other insect enemy? In all my travels I have nowhere felt nearer the ideal Garden of Eden than in some of your lovely valleys, yet unvisited by these destroying atoms. The profusion and perfection of fruit and flower, the elysian character of the landscape, the genial sun—all appeal to the higher esthetic feeling in man, and one is moved to enthusiastic contemplation and admiration of the glories of nature and the bounties of heaven under such favoring conditions!

State Entomologist.

You know better than I do how your laws have acted in the past and are acting now, and how far your State Inspector and your different county inspectors have succeeded.

But, before passing this matter of legislation, I should be derelict in my duty if I did not urge upon you the value of one form of legislation which has not yet been tried. Without abating one iota the work already being done, whether by individuals or boards, it does seem to me that if you had a State Entomologist, *i. e.*, an officer appointed to devote his entire time to this subject of economical entomology in the State, much additional good might be accomplished, provided he were properly supported and given the means to carry on his work effectually. You should not commit the same error that has been committed by some of the Eastern States, in which the cultivators of the soil have desired to have such a State Entomologist appointed. In three cases which I now have in my mind there has been quite a disposition on the part of the Legislature to pass a proper bill, but it has failed in each case because of the conflicting interests which aimed to control the office. Either the State Board of Agriculture, or a State Horticultural Society, or a State Agricultural College, or some State University, or some other State institution, desired to have the honor and the privileges pertaining to the office, and, between them all, failure has resulted. I should like to see California with a competent State Entomologist appointed, under a bill carefully drawn up providing his duties, by the Governor, upon recommendation of the professor of agriculture in your State University, and the president of such other State horticultural and agricultural bodies as may exist. In this manner the interests of all these bodies might be considered, and the State could not, in my judgment, make a more profitable investment than in the creation of such an office.

Importation of Parasites.

It has doubtless occurred to many of you that it would be very desirable to introduce from Australia such parasites as serve to keep this Fluted scale in check in its native land. We have already seen that there is one minute parasite which has, in all probability, been brought over with it from Australia, and there is no question but that it is very desirable to introduce any such of its enemies and parasites as can be introduced. This State—yes, even Los Angeles county—could well afford to appropriate a couple of thousand dollars for no other purpose than the sending of an expert to Australia to devote some months to the study of these parasites there and to their artificial introduction here. But the agent must be an expert entomologist, and his selection should be left to some competent authority. The result for good, in the end, would be a million-fold, and I have no fear but what you, as orange-growers, will appreciate the force of this statement. I would not hesitate, as United States Entomologist, to send some one there with the consent of the Commissioner of Agriculture, were the means for the purpose at my command; but unfortunately, the mere suggestion that I wanted $1500 or $2000 for such a purpose would be more apt to cause laughter and ridicule on the part of the average committee in Congress than serious and earnest consideration, and the action of the last Congress has rendered any such work impossible by limiting investigation to the United States.

Remarks Confined to the Orange.

Let me, in closing, lay stress on the fact that I have, in all that has been said relating to remedies, had reference solely to the Orange and the scale-insects affecting it.

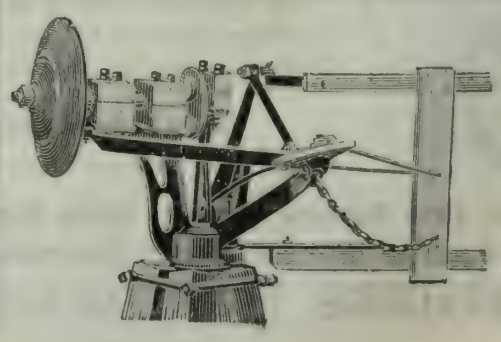
The Fluted scale is undoubtedly the most difficult to master, and the means I have recommended against it apply equally to your other Orange scales, as experiment has already demonstrated. Your Red scale, in some respects even worse than the Icerya, and of which I should like to say something in detail did time permit, succumbs to it. But when it comes to the treatment of deciduous trees, much that I have said will not apply, and each tree needs separate consideration and is affected differently by different washes.

Prosperity vs. Insect Pests.

In passing from place to place since I have been in the State, and more particularly in visiting the different parts of Los Angeles county, I have been struck with the wonderful activity everywhere manifest in real estate. Land is "booming" in all parts of the country, but nowhere has it reached such proportions, it seems to me, as right here in this part of California. There does not, at first, seem to be much connection between the real estate boom and the scale-insects of the Orange. But I am quite sure that the rapidity with which your orange orchards have been and are being converted into town blocks and town lots has a marked influence on the spread and increase of these scale-insects; for no sooner does the owner of a grove subdivide and sell it than the different new owners allow it to "run to grass," so to speak, and for miles around all your thriving and growing centers of population may be found neglected orchards upon which the insects are reveling and multiplying and scattering into those which are more carefully cultivated. To this cause is, in my judgment, due very much of the rapid reinfesting of these cultivated orchards, so that your insect troubles are, in a measure, connected with your unprecedented growth and prosperity.

Not an Unmixed Evil.

Finally, let me say, before taking my seat, that your scale insects are not an unmixed evil. With your lovely climate, rich and varied soil, and the many other advantages which your beautiful country possesses for the cultivation of the Orange and most other fruits, the business would soon come to be overdone and rendered unprofitable, could every one, before planting his trees, feel sure of an abundant and fair crop without having to contend with difficulties. Under these circumstances, it seems to me that even the dreaded scale-insects, by driving the thriftless to the wall and giving the careful and intelligent man who persists in destroying and defeating them, better prices for his product, may, after all, prove a blessing in disguise. One thing is sure, it is pure folly to talk of giving up the battle and abandoning the field to these your tiny foes. There is no insect that is invulnerable, or that we may not overcome if we but attack it at the right time, in the right place and with proper means and ability. You will, ere long, feel yourselves masters of the situation, and if what I have said will aid in ever so little to give you the victory I shall feel abundantly rewarded. I have already occupied more of your time than I intended to, and though much is left unsaid, even about this single insect, I must close in order to leave time for discussion. In doing so, permit me to congratulate you as a Board for the good work already done, and to prophesy that in future years when the fair and unrivaled fruit of this coast shall have multiplied beyond the most sanguine vision of any of us, and have found its way in one form or another to consumers in all parts of the world, the people of California will gratefully remember the work you instigated and the battles you fought. Ladies and gentlemen, I thank you.



Quite a long discussion followed the address, the fruit-growers present asking many questions, all of which were most fully and satisfactorily answered. This address, with the discussion which followed and the queries and answers, will form by far the most interesting portion of the official publication of the convention. Everything said was taken down in full and in due time will appear in the official report. The discussion was continued until the close of the day.

Before it was fully concluded, the president called upon Mr. W. G. Klee, State Inspector of Insects, for an essay on the general subject of insect pests, for which he had been booked. In response that gentleman said that he had prepared no formal essay, as most of what was desired had been gone over at the last previous session of the board and would be published as soon as the State Printer, in his straitened circumstances, could get around to it. Mr. Klee, however, proceeded to make some informal remarks upon the subject of insect pests in general, during which he made some comments on certain portions of Professor Riley's address, especially upon the remedies to be used—the washes in particular—and the special modes of applying them.

THE VINEYARD.

Influence of the Mode of Fermentation on the Color of Wines.

University Experiment Station, Bulletin No. 68

It will be remembered that toward the end of the vintage season of 1886, a series of nine fermentations, intended to test the influence of various methods of fermentation upon the resulting wines, was made at the viticultural laboratory; the material being second crop Zinfandel grapes furnished by Mr. Gallegos, of Mission San Jose. The first results of these experiments were given in Bulletin No. 63, and more extendedly in the Viticultural Report for 1886, pages 116 to 124. As time progresses the differences between the several products become in some cases much more marked than they were at first; among these the color-changes are especially notable and practically instructive.

The table below shows the intensities and tints observed by means of the colorimeter at three different times, the first being immediately after pressing, the date of which was between November 7th and 15th.

	Mode of Fermentation.		Percent of Color at Pressing	Tint.	Percent of Color Dec. 20, 1886.	Tint.	Percent of Color April 8, 1887.	Tint.

562	Foulage and floating cover—Temp. 62°		34.5	3d p.r.	31.0	3d p.r.	17.0	4th p.r.

NOTE.—"p. r." means purple red; "r." means red.

It will be noted that of the nine wines, five had at pressing a full amount of color, averaging about 46 per cent of the (assumed) maximum of the scale; while the four others had in the neighborhood of 30 per cent only, the lowest being in the case of the sample fermented with one grated frame (No. 559) that kept the pomace submerged in one mass, but was not stirred at all during the fermentation. The next lowest was the one in which three frames were used (No. 558); the next to this the one fermented at 100 degrees without cover (No. 557) but with frequent stirring; the next, the one treated in by our usual method, with solid floating cover and twice-daily stirring, but at 62 degrees (No. 562) instead of the usual temperature of 75°; while the one similarly treated at the latter temperature (No. 561) had the maximum of 47 per cent of color. The influence of a high temperature in securing a rapid and full extraction of color was further shown in the sample similarly fermented at 100 degrees (No. 556), in which 46 hours sufficed to extract the color fully. A comparison of the samples treated without stirring with those in which stirring was practiced, leaves no doubt of the beneficial influence of the "*foulage*."

In the readings of Dec. 20, however, the differences originally brought about by difference in the temperature of fermentation are already greatly diminished. Nos. 556, 561 and 562, which were fermented respectively at 100, 75 and 62 degrees, now show a difference of only 6 between the two first on the one hand and the third on the other. On April 8th these three samples have become exactly alike, both in intensity (17) and in tint.

It thus appears that the apparent advantage of a high temperature in fermentation, in extracting the color, was only a temporary one, and has ceased to manifest itself just about the time that new wines are usually sold. The little color of the wine made at 62 has maintained itself, having lost only 50 per cent of its original intensity, while the two others suffered an average loss of 63 per cent.

It still remains to be shown that the same rule holds good for *all* red grapes; but it seems definitely proven that in the Zinfandel grape at least no permanent advantage is gained for color by fermenting at a high temperature, unless some means were found to prevent the loss occurring under ordinary treatment.

A very striking point is shown in the case of the two wines in the preparation of which no stirring was practiced, and in which, therefore, we may assume that only the most interior portion of the color-bearing layers was extracted at all. Here we have in the case of No. 558, with an original intensity of 30, a decrease to 7.4, or nearly 75 per cent loss. In No. 559, although the original intensity was less—27.8—the color has remained at a better figure—9.0—doubtless for the reason that the higher temperature produced in the thick pomace mass caused the more permanent pigments of the exterior layers to be partially extracted. This is also indicated by the tints observed, which in the latter sample lie nearer the purples than in the former.

It thus again appears that in the case of Zinfandel wines *not* subjected to *foulage* or its equivalent during fermentation, not only is the color extracted less as a whole, but is also of a less permanent character, and lies toward the "reds" of Burgundies rather than the "purple-red" tints of the Bordeaux wines.

Glancing at the column of intensities observed on April 8th, it appears that the maximum of color has been preserved by the sample fermented according to the usual practice of the viticultural laboratory, viz.: No. 561, which stands 2.6 points above the highest sample made according to any other method. This sample has also preserved more nearly the purple-red Bordeaux tint than any other; those fermented without any cover (Nos. 557 and 560) having on the contrary gone decidedly farther toward the reds. That this is the tendency of all these samples is obvious from an inspection of the table of tints; and it is in accord with what is known of *all* red wines, and will be amply apparent from a tabular statement of our observations upon a large number of wines, soon to be published.

It should be remembered that, as stated in a former bulletin, the French color-scale runs from simple "purple-red" through five numbered shades toward "red," and from this again through progressively numbered shades of red to orange, the final stage being the brownish-red color of old port wines.

Berkeley, April 15, 1887. E. W. HILGARD.

DEATH OF CHARLES KOHLER.—Deep regret is expressed in vine circles and in the many social and business circles in which he was a prominent figure, over the sudden death of Chas. Kohler, which occurred in this city April 18th. Mr. Kohler was a native of Mecklenberg, Germany. He came to California early and soon saw the adaptations of the country for the wine industry. In this industry he was the pioneer and labored zealously, and in spite of many obstacles at first, for its advancement. In this effort he has been very successful and amassed a fortune. He died at the age of 57 years, and his death is a great shock to his friends who counted upon his presence among them for years to come. Mr. Kohler is described as a man of persistent industry, kindliness of disposition, generous and hospitable.

Misses' Sailor Costume.

For boating, mountaineering, etc., the mode is exceedingly comfortable and jaunty. It is here shown developed in sage-green flannel. The skirt falls in full, pretty folds about the figure, and its top is gathered to the belt, finishing the bottom of the blouse. It has a wide hem at the bottom, and above the hem are five deep tucks. The blouse is gathered at the lower edge and droops in its peculiar fashion over the belt. It is shaped by side and shoulder seams, and its neck is finished with a standing band, below which at the back is joined the jaunty sailor collar, which is quite deep and extends down the fronts to the bust, where its ends meet under a pretty bow of crimson ribbon. Buttons and buttonholes close the blouse, and the coat sleeves are severely plain. Linen cuffs and a linen standing collar are worn. Flannels of all varieties, also serges, cashmeres, light cloths, camel's-hairs, etc., will be devoted to such costumes, and so will ginghams, piques, lawns, chambrays and all kinds of washable textures. In white and cream the mode is charming in all materials. Braids, contrasting bands or pipings, fancy stitching, etc., will be the preferred garniture when a plain finish is not desired. The collar may be of velvet or other contrasting material, and the sleeves be faced in cuff fashion to correspond. An effective decoration is achieved by fastening the hem and tucks and bordering the collar, wrists and neck band with fancy stitching contrasting in color with the material. The brim of the pretty hat is smoothly faced with velvet, and ribbon and thistle pompons.

MISSES' SAILOR COSTUME.

Money Loaned

On Country Real Estate in large and small amounts, at lowest rates, by A. Schuller, 106 Leidesdorff St., room 3. **

A Pitiful Sight.

What sadder sight can be imagined than that of a noble man, whom the world can ill-afford to spare, stricken down in the prime of a useful life by consumption? Thousands are yearly filling consumptives' graves who might be saved by the timely use of Dr. Pierce's "Golden Medical Discovery," which is a positive cure for consumption in its early stages. It is the best alterative and pectoral in the world. All druggists.

* * * * Confidential advice, to either sex, on delicate diseases. Book, 10 cents in stamps. Address, World's Dispensary Medical Association, 663 Main St., Buffalo, N. Y.

Man's inhumanity to woman makes countless thousands mourn, would be an applicable rendering of Pope's line, in view of the indignities she has suffered and pains undergone at the hands of unskillful physicians and quacks. Naturally modest, she suffers on until forced to consult a physician regarding some female difficulty which she well knows is sapping her strength. All this embarrassment can be avoided and a cure effected by purchasing Dr. Pierce's "Favorite Prescription" of your druggist, and taking as directed. Price reduced to one dollar.

PERCHERONS BEST FOR CITY USE.—A. M. Stein & Co., Brooklyn, N. Y., handle 2000 horses annually, mostly heavy draft. They say of the grade Percherons: "We handle more of the Percherons than of any other breed. There is more demand for them. They give the best satisfaction, *no matter how little of the blood there is in them.* Generally they have good feet and last better on our pavements than the Clydesdales or other breeds. Tell the farmers of the West to *keep* their Percheron mares and *breed* them. Would advise breeding to Percheron horses in preference to any other breed."—*Chicago Tribune.* The greatest importer and breeder of Percherons is M. W. Dunham, of Wayne, Illinois, who has imported and collected at his Oaklawn Farm altogether some 2500 of these valuable horses. His purchases are exclusively confined to pedigreed animals, recorded in the Percheron Stud-Book of France, as the honest and careful breeders of pure bred stock would no more buy a horse imported from France without a pedigree than they would buy an imported Shorthorn or Hereford bull that was not recorded in England.

Butter in Five Minutes.

Attention is called to the advertisement of a patent churn-dasher which appears for the first time in this issue. A RURAL PRESS representative witnessed a public exhibition of the working of the dasher, given last Saturday in Mr. Taylor's rooms. A five-gallon churn contained six quarts of cream, and from the first movement of the dasher until the butter was ready to take out the time was several seconds less than five minutes. The cream used was brought in by an employe of a dairy after the assemblage to witness the exhibition had gathered.

Lands For Sale and To Let.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. **20,000** acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION, 401 California St., San Francisco.

FOR SALE.

2240 Acres of land in Shasta Valley, Siskiyou county, Cal. Six miles from Montague. It is well watered with living springs, is fenced, has a house, barn and granary upon it. Two-thirds are suitable for cultivation and all is good grazing land, Price $25,000.

Also, 3240 Acres adjoining the TOWNSITE OF MONTAGUE. For further particulars, call, from 10 A. M. to 2 P. M., at room 2, 116 California Street, San Francsico, Cal., C. C. WEBB.

20-ACRE TRACTS.

Fine, rolling, cleared, reddish-brown land, under cultivation in the Shasta Fruit and Raisin Colony. Twenty acres for $500. Terms: $200 cash, and balance in installments to suit purchaser, at 8 per cent per annum. Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired. Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

FOR SALE.

150 ACRES of New York Island, Suisun Bay, $2200. West's Island entire, near Antioch, about 200 acres, $3500. Also, Winter's Island entire, opposite Pittsburg and Collinsville, about 700 acres, with improvements, $12,000. All good for dairying, hog-raising, fruit culture, etc. Abundance of nutritious grasses all the year, and here stock survives the greatest freshets without levees. Would LEASE portions unoccupied, or EXCHANGE for good residence property.

WM. WINTER, 710 Capp St., S. F.

FOR SALE!

A Fresno County RAISIN VINEYARD.

ALFALFA and GENERAL FARM.

800 Acres.

Under a fine state of cultivation and irrigation. Fences, buildings, ditches, levees and checks built in the most substantial manner. Soil unexcelled, as growth of products show. Located near one of the most thriving towns on the S. P. Co.'s Railroad. **Two hundred and twenty-eight acres in vines,** from one to six years old; all have been planted and cultivated by the most experienced vine-growers, and will soon be a prominent Raisin Vineyard of Fresno County. About 200 acres in Alfalfa. The rest of the land is now in grain crops. The farm is well stocked with horses, mules, cattle and hogs. This is a good, substantial interest-paying investment with a great future Will be sold at a very reasonable price, with easy terms of payment if required. For full information and map, apply to

ALBERT E. CRANE.

410 Montgomery Street, San Francisco, Agent for sale of all kinds of Country Property.

Choice Homes in Contra Costa.

Improved Places for Sale near Walnut Creek.

One lot of 11 acres, with house of six rooms, pantry, milk-room and summer kitchen, in good repair; barn, chicken-house, etc., and fine orchard of various fruits. Situated within 1½ miles of the village of Walnut Creek, this offers an almost ideal home to those desiring a sheltered spot in an almost perfect climate. Price, $2000.

Also, 12 acres close by the same village, half set to Zinfandel grape-vines, just coming into bearing, with four-room house—hard-finished and nearly new—stable, etc. Price, $2300. Wells of excellent water on both places.

IMPROVED and UNIMPROVED FARMS at Very Reasonable Prices!

Correspondence solicited, to which prompt and careful attention will be given.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canals and entitle the owner to one-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

Wagon & Carriage Materials and Hardware.

HOLT BROTHERS,
30 and 32 Main St.,
SAN FRANCISCO.

Our Improved Harvester will, without question or doubt, be the most popular machine in the grain field this year, as it certainly was last year, wherever used. Everybody who saw it working in the grain, running over rough ground, through hog wallows, over fields studded with trees, with as much ease and regularity as though the fields were smooth and level. Read the testimonials of several farmers who used our Harvester last year.

We have improved our machines over last year very materially, strengthening the weak points by putting in additional truss-iron braces, increasing or lowering speed when required, shortening the chain belts and substituting pivot and sliding boxes for the old fashion solid boxes, which will not give a particle as the frame warps or twists out of line. The greatest and most desirable change we make this year is discarding the sleeve on the main shaft, which caused us more trouble last year than anything else, by sticking to the shaft, making it grind the shaft and run hard. In a few weeks' time it wore away, leaving it rickety and causing the cylinder to run unsteady. This most desirable improvement makes it run one horse lighter at least.

Some of the agents of other manufacturers have sought to frighten farmers into buying their machines by telling them if they buy our Improved Harvester that they are liable to be prosecuted for infringement of patents. Now, these agents know, or if they don't know they ought to, that what they assert is false and malicious. Our Improvements are our own, and infringe upon nobody's patents. To allay all apprehension in the minds of intending purchasers, we say here that we will protect you against any and all losses on account of suits for infringements. The following are some of the advantages our Improved Harvester possesses over all others:

1. Our Improved Harvester runs FOUR horses lighter than any other machine made.
2. It is easily handled, and turns a square corner as readily as a mowing machine.
3. It is less liable to get out of order, and cheaper to keep in repair than any other machine.
4. It has no clumsy, expensive gearing to wear out or break.
5. It is run mostly by Link and V-Belts which, in case of breakage or accident, can be repaired in the field without loss of time.
6. Our Harvester makes no noise to frighten or irritate the horses, and makes less noise than ordinary headers.
7. Our Header is far the simplest and runs the lightest, and is the strongest and best. There are no Rickety Gears or Trembling Rods to break.
8. The Header may be raised and lowered instantly from any part of the Separator.
9. Our Harvester WEIGHS FIFTEEN HUNDRED POUNDS LESS than any other machine of the same capacity in the market.
10. It will cut, thrash, clean and sack more grain in a season, with less expense for labor and repairs than any other Harvester ever turned out.

Remember, all our Improved Harvesters are warranted to work well or no pay. Examine them before purchasing elsewhere. We shall sell our Harvesters upon their merits alone.

TESTIMONIALS:

GRAYSON, CAL., Feb. 21, 1887.

MESSRS. HOLT BROS. Dear Sirs: As to your machine, we think it a good one. It saved the grain well. Had but little lost time; as to expense, $25 would cover the whole for the entire season. Number of acres cut, 1750. If we were going to buy another, we should certainly get one of yours. Respectfully, F. CARPENTER, R. BROWN.

OAKDALE, Feb. 21, 1887.

MESSRS. HOLT BROS.—Gents: I ran one of your Combined Harvesters last year. Cut 1950 acres of grain in 63 days. Did not lose over one day making repairs and replacing extras. Repairs cost about $10. I cut both light and heavy grain. It did good work, and the grain brought the highest market price, on account of its being better cleaned. I am perfectly satisfied with my purchase. I have worked with three other Combined Harvesters, and consider yours the best in the field for lightness of draft, durability and fine work.

Respectfully yours, D. W. CARMICHAEL.

GRIDLEY STATION, Sept. 22, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: I have used one of Holt Brothers' Link Chain and V-Belt Combined Harvesters, and consider it (in my opinion) the best Harvester made. This season I harvested 800 acres; averaged 23 acres per day, with 12-foot cut. I consider the draft is four horses lighter than either the Houser or the Young Machine. It does better in all kinds of grain than either of the above-named machines. I run the whole season without any breakage.

GEO. WICKMAN.

TURLOCK, Sept. 16, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: Your letter of the 8th inst. received and contents noted. In reply I will state that I think your machine is the best that is made. I cut 1350 acres of grain with it in 42 days. I did not have to repair the machine from the time I started till I quit running it. It runs lighter, and I think does the best work of any machine that I have seen. Very respectfully, ED. McCABE.

DIXON, Sept. 10, 1886.

MESSRS. HOLT BROS., San Francisco—Dear Sirs: Yours of Sept 8th at hand and contents noted. Will try to answer your questions as nearly correct as I can. Of course I have not seen all of the different Harvesters working, but from what I have seen and learned, will say that so far as my information and experience goes, your Link and V-Belt Harvester is, in all respects, the best in use. It did as good work, if not better work, than the Houser here. It pulls from two to four horses lighter than the Houser. My repairs were nothing; was not detained at all in my harvest on account of breakage. I cut 600 acres in 23 days, and moved four miles three different times. Yours truly, JOS. KLINE.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING APRIL 12, 1887.

361,126.—GRAIN DRIER—Borland & Parsons, S. F.

361,205.—BEET PULLER—R. R. Burrows, Potter Valley, Cal.

361,133.—SMOKE-CONSUMING FURNACE—C. C. Carter, S. F.

361,134.—CHINESE LANTERNS—Lam T. Chu, S. F.

361,064.—STOVE—Francis Jackson, Oakland, Cal.

361,076.—WHEEL AND AXLE—J. Pettinger, Santa Barbara, Cal.

391,183.—KEY FASTENER—F. Reisner, Eugene City, Ogn.

360,930.—MINING CAR—J. M. Thompson, S. F.

14,281.—TRADEMARK—J. F. Nolan, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

IMMENSE SHIPMENTS OF MACHINERY.—Manufacturers of machinery destined for shipment to distant markets made haste to get as much of their goods underway before the incoming of the Interstate law as possible. From M. K. Lauden, general agent of Wm. Deering & Co., in this city, we have a copy of the Chicago *Tribune* of April 2d, from which we take the following: "Merchants and manufacturers in Chicago have been generally taking advantage of the last days of the old state of affairs to ship out large consignments. As an illustration of this the Deering Harvester Works sent out on Friday and Saturday five solid trains of about 30 cars each loaded with machinery. These trains, gay with flags and banners, all go to the State of Nebraska alone and will go through to their destination as complete trains. Taking advantage of the low rates, the Deering Company has shipped upward of 900 cars of machinery in the last three weeks, taxing the capacity of their works, in which they are working 2500 men, to the utmost."

CHERRY BLOSSOMS.—One morning last week a friend handed us a little bunch of bloom, plucked from a cherry tree of Dr. T. F. Bacon's, at Fruitvale. At the tip of the twig, within a space hardly two inches long, sprung 72 buds and blossoms, in clustered, fragrant loveliness. We were told that the whole tree-top was a mass of snowy flowerage, and that this was but one, though a particularly fine sample, of the beauteous promise of the orchards thereabout. What a hint of refreshment such a posy brings to those "in populous cities pent," week after week, month after month can scarcely be known to such as get frequent runs and breathing spells in the country, or live amid the fields and groves all the year round.

A REPRESENTATIVE of the PRESS made a flying trip last week through the lower part of Sonoma county to Santa Rosa. At this growing inland city he found tokens of substantial prosperity, rows of brick buildings and fine residences going up on every hand. Numbers of visitors are looking for lands, and the real estate office of Guy E. Grosse was crowded with home seekers from different portions of California and Eastern States. W. H. Worth, of Petaluma, had just received three orders for his wine and cider press, and was preparing to put a large force at work manufacturing these presses and the new patent grape-stemmer and crusher.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

SHORTHORN CATTLE.—In our advertising columns will be found a card of Hyde & Moore, of Visalia, offering shorthorns for sale. The herd owned by these gentlemen has been well spoken of by RURAL correspondents who have visited the farm, and created a good impression when exhibited at the leading fairs last fall.

NEW GRAPEVINES.—The Viticultural Commission has received from William Farrar, a vineyardist of Queen Beyan, N. S. W., several cuttings of grapevines to be tested in this State. The varieties are: Baxter's late sherry, Ancarot and Shepherd's Reisling. The vines will be set out at C. A. Wetmore's vineyard at Livermore.

Fortune's Favorites

Are those who court fortune—those who are always looking out for and investigating the opportunities that are offered. Send your address to Hallett & Co., Portland, Maine, and they will mail you free, full particulars about work that you can do while living at home, wherever you are located, and earn from $5 to $25 per day and upwards. Capital not required. You are started free. Both sexes. All ages. Some have earned over $50 in a single day. All is new.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

It will Pay You to Examine the

Rushford Tubular Steel Axle —AND— Steel Skein Wagons!

BUILT FOR THE PACIFIC COAST TRAD E.

The Tubular Axle is made from one piece of wrought steel, from end to end, including spindles; with polished case-hardened spindles and ground, seamless boxes. The manufacturers guarantee to replace any Tubular Axle bent or broken, no matter under what weight or circumstance.

THE RUSHFORD STEEL SKEIN RANCH WAGON

Will carry 1000 lbs. more weight than the same size of Iron Skein Wagon.

1. It is the only skein covering the tapering portion of the axle in SOLID STEEL.
2. It envelops more of the axle with SOLID STEEL than any other skein.

We carry all sizes of Tubular Axle and Steel Skein Wagons, with capacities from 2000 to 15,000 pounds. Prices same as in the old style of iron axle and skein wagons.

BANDMANN, NIELSEN & CO, General Agents, San Francisco.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOERIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90	per cent
Reverted Phosphoric Acid	.95	"
Insoluble Phosphoric Acid	2.83	"
Potash	2.23	"
Ammonia	1.87	"
Nitric Acid	2.95	"

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOERIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article**, and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California**, on account of the **predominance** in it of **Phosphoric Acid**, which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia**, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

THE BLATCHLY FRUIT DRIER.

A Treatise on the Horse and his Diseases

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7½x5 inches. Price, only 25 cents, or five for $1, on receipt of which we will send by mail to any address. DEWEY & CO.,
220 Market St., S. F.

California Inventors
Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, April 20, 1887.

The weather the past week has been of the very best for growing crops, putting all vegetation well along. The feeling is more cheerful, owing to the improved prospects of crops. In cereals, Eastern advices reported lower prices up to to-day, when there was a slight advance. The European wheat market has ruled firm. To-day's cable is as follows:

LONDON, April 20.—Cargoes off coast, quiet, but steady; cargoes on passage and for shipment, do; Mark Lane, steady; Cal. wheat just shipped, 38s 9d; Cal. wheat nearly due, 37s 9d; Liverpool wheat, spot, firmly held; Liverpool wheat, Cal. 7s 6d to 7s 9d.

Foreign Review.

LONDON, April 18.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: The deliveries of native wheat have been restricted. The remainder of the crop in hand now is supposed to be small. Values are hardening. Sales of English wheat during the past week were 36,967 quarters at 32s 8d, against 49,954 quarters at 30s 10d during the corresponding week of last year. Foreign wheat is firmer, although the inquiry is inactive. In the Liverpool market, prices are 1d higher. The quotations of wheat cargoes on passage are nominal. To-day wheat was quiet but steady; prices were rather against buyers. Flour was steady; corn, firm; oats, 3@6d dearer; beans and peas were 6d@1s lower.

Eastern Wool Markets.

BOSTON, April 17.—There has been an improved demand from manufacturers the past week. Transactions amount to 3,059,100 pounds of all kinds. This total is composed largely of foreign wool, principally Australian, but sales of domestics reach upward of 1,750,000 pounds, a larger amount than for several weeks past. This better demand indicates the manufacturers have become convinced that prices are about as low as they are likely to be for the present. Most of the wool now on the way here has been sold to arrive. Unless there is some change made in the freight rate, wool will accumulate rapidly at San Francisco. The Interstate Commerce Commission has been petitioned to suspend Section 4 in relation to wool. It is reasonably certain this will be done. There has been a moderate demand for Texas wools. Sales are noticed of 20,000 pounds fall at 19 to 20c; 92,000 pounds fall at 16 to 19¼c; and 20,000 pounds fall on private terms. In fall California wool there have been sales of 89,000 pounds on private terms. In unwashed and unmerchantable fleeces there have been sales of 15,000 pounds, medium, at 25 to 31c; 33,000 pounds fine at 22c; 10,000 pounds fine at 21c; 6000 pounds unmerchantable at 22c; and 50,000 pounds unwashed on private terms. Receipts for the week have been 3646 bales domestic and 8397 bales foreign.

NEW YORK, April 17.—Quietness has prevailed, with the tone of the market barely steady. Prices, though nominally unchanged, tend to favor buyers. Manufacturers are purchasing sparingly; only their immediate wants are looked after. Sales of the week included 20,000 pounds unwashed western at 31c; 50,000 Territory at 21c; 50 bales Colorado and 25 bales scoured California on private terms. California fall, fine, quoted at 18@20c; do low, 11@17c; California spring fine, 24@26c; medium, 20@23c; low, 14@17c; Territory, choice, 25@27c; fair to good, 20@23c; coarse, 15@19c.

The Philadelphia market is dull. Manufacturers are buying only for urgent wants. Stocks of wool are very light, aside from fine fleeces and Territory clips, of which fair assortments are still available. Among sales were 2000 pounds New Mexican, improved, at 17@20c; 2000 pounds carpet at 13½c.

The London Wool Market.

LONDON, April 18.—At the wool sales today there was full attendance. Extreme prices were demanded for all kinds.

Crops at the East.

CHICAGO, April 17.—The following summary will be published by the *Farmers' Review* to-morrow: Correspondents from nearly every county in Kansas, Missouri, Illinois, Indiana, and Ohio report that there has been no adequate relief from the drought, and that high and dry winds are causing steady deterioration in the condition of winter wheat. A certain percentage of damage has already occurred, yet notwithstanding impending great injury which much longer prolongation of drought would effect, the generality of reports from the wheat districts continue favorable. The pastures and meadows in the States of Illinois, Indiana, and Ohio are already suffering very seriously, however, owing to the lack of rain. Spring wheat seeding has been nearly completed in Illinois and Iowa, and is in progress in Minnesota, Dakota and in Michigan. The ground is reported to be in a favorable condition in Iowa, Dakota and Minnesota for the reception of the seed.

Eastern Wheat Markets.

NEW YORK, April 17.—Wheat at close prices rallied a trifle from the lowest point. Final losses were scored of 1⅛c for April and May at 92½@92¾; for June at 92¾@92½; for July at 91⅞@91⅜; for August at 91½; September 91⅞; and ¼c for December at 95⅛c.

NEW YORK, April 20.—92½c for May, 91⅞c for June, 91½c for July, 90⅝c for August.

CHICAGO, April 20.—83⅛c for May, 81⅛c for June and 81⅜c for July.

Dried Fruit and Canned Goods East.

NEW YORK, April 17.—Canned Goods—A moderate trade is reported by jobbing houses. Corn is scarce and firm. Tomatoes are held steadily.

Dried Fruit—Raisins, steady with limited sales, California loose Muscatel, two-crown, $1.25@1.70. Prunes, Turkish, dull and easier at 4⅜@4⅞c; Bohemia, weaker at 3½c; French, irregular at 6½@7c for 60's and 90's. Currants are in moderate demand from jobbers, closing firmer at 4¾@4¾c. Citron is selling at 16¾c for Leghorn.

NEW YORK, April 18.—Agents of California growers are endeavoring to obtain orders for canned fruits that will be packed the coming month. Buyers are solicited to purchase upon a "free on board" basis, but all are uncertain as to what the lay-down cost is likely to be when freight rates are added. A few orders have been taken, but these have been narrowed down to small quantities, sufficiently only to make a show in stock when the goods are available.

New York Hop Market.

NEW YORK, April 17.—There were a few sales and some bids that gave the market a slightly better tone last week. Some very good 1886 Californias sold at 18c, and a bid of 21c for over 150 bales of choice Washington was refused. Four hundred bales of 1884 Pacifics brought 6c, not 5c, as previously rumored. Pacific Coast crop, 1886—best, 21@22c; do, common to good, 14@17c, 1885, good to prime, 7@9c.

California Products at New York.

NEW YORK, April 17.—Green Fruit—The only pears to be had are California Easter Beurres, which are large and of fine flavor, selling at $3 a dozen. The seedless Navel oranges are in great demand and sell at $1.50 per dozen.

Seeds—Mustard, firm but quiet; California yellow, 4¼@4½c.

California Fruit in Chicago.

CHICAGO, April 16.—There has been no appreciable change in the prices of oranges this week from last. The receipts of oranges from California still keep up to the demand. Choice fruit has met with a fair sale and prices here ruled firm, while common grades and smutty oranges are slow and easy. Florida stock is getting scarce. The principal trade is in Californias. The following prices are quoted by the *Daily Trade Bulletin's* official circular of the street: Bright Riverside, $3.50@4; San Bernardino, $3 50@4.25; Santa Ana, $3@3.25; Orange, $2.50@3; Los Angeles, $2.75@3.25; Navel oranges, according to quality, $5@6; Duarte, $3@3.50; San Gabriel, $2.75@3; blood oranges, fancy, $5@7; culls, $2.

The dried fruit market is quiet, if not a little dull. Country orders are not increasing yet, but stocks are supposed to be getting rather low. California dried fruits steady all round. There have lately been fair arrivals of raisins. This line of fruit meets with good sale, the quality being very fine. Other descriptions are at present in small supply and generally steady. Prunes, French, 8@9¼c ₩ lb; plums pitted, 10@11c ₩ lb; peaches, halves, 11@12½c ₩ lb; peaches, halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London Layers, 20-lb boxes, $1.40@1.50; loose Muscatel, $1.20@1.30; California Layers, $1.25@1.35 ₩ box.

Local Markets.

BAGS—The market has ruled quiet and dull throughout the week at from 5¾@6c for standard Calcuttas.

BARLEY—The market ruled quiet but steady throughout the week up to to-day, when it was strong at full figures. On Call, trading has been fair, but at prices showing slight variations. The following are to-day's sales:

Morning Session: Buyer season — 500 tons, $1.08½; 500, $1.08¾; 400, $1.08¼; 200, $1.08. Seller 1887—200 tons, $1.00½ ₩ ctl.

Afternoon Session: Buyer season — 100 tons, $1.08⅝; 200, $1.09. Buyer 1887—100 tons, $1.13; 100, $1.13¼; 100, $1.13½. September—100 tons, $1.04¾ ₩ ctl.

CHEESE—The market is strong and slightly higher, owing to lighter stocks and an active demand. Since the Interstate Commerce law went into effect many points are buying here that purchased at the West.

BUTTER—The market is strong at an advance. The outturn this season is below last year's, while the consumption is larger.

EGGS—Heavy supplies of Eastern eggs cause the market to rule weak and in buyers' favor, except for very choice Californian, which are well maintained.

FLOUR—The market is strong at another advance. Several mills that shut down have started up again.

WHEAT—The market ruled weak and easy up to to-day, when a stronger tone was discernible. The supply in the State is light for the season. On Call, trading has been fair, with a lower range ruling up to to-day, when under stronger buying an advance was established. The following are to-day's sales:

Morning Session: Spot, season's storage paid—500 tons, $1.75¾. Buyer season—100 tons, $1.85; 1200, $1.85¼; 600, $1.85½. May—100 tons, $1.77: 100, $1.77½. July—400 tons, $1.79. August and September—100 tons, $1.70. Buyer 1887—300 tons, $1.96; 200, $1.96¼; 100, $1.96¾; 500, $1.96½; 100, $1.96⅝. Seller 1887—1700 tons, $1.68¾; 800, $1,68⅝; 500, $1.68¾; 500, $1.68¼; 300, $1.69 ₩ ctl. Afternoon Session: Buyer season—400 tons, $1.85⅝; 200, $1.85½. Buyer 1887—300 tons, $1.96¾. Seller 1887—200 tons, $1.69¼; 700, $1.69⅜; 800, $1.69½. May—100 tons, $1.77¼; 100, $1.77⅛ ₩ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

Eastern advices report considerable damage to the winter wheat crop in Michigan, Kansas, and Ohio. In some sections of Ohio many fields were plowed up. The spring seeding in the Western States is reported by telegraph completed. The acreage is placed at 14,000,000 acres. On April 2 the visible supply of wheat was 51,585,985 bushels, a decrease compared with the preceding week of over 1,100,000 bushels and only about 2,500,000 bushels in excess of the quantity on April 3, 1886. This year the quantity in farmers' hands is very considerably below the amount held last year at this time. The reason of the very light supply in farmers' hands is that high prices ruling for wheat have caused farmers to make deliveries. The exports from the Atlantic seaports from September 1, 1886, to April 2, 1887, aggregate 42,356,898 bushels against 12,242,902 bushels in the like time in 1885–86. Several of the large Minneapolis flouring-mills are to shut down soon and await developments.

Advices regarding the wheat crop on this coast continue favorable in Western Idaho, Eastern Washington Territory, and both Eastern and Western Oregon. In this State the growing plant is doing exceptionally well, owing to fairly cool, moist weather. The early sown grain is well stooled and has good roots, but the late sown is not stooled out so well. As the bulk of the acreage seeded to wheat is in the belt subject to the hot north winds, it is not safe to estimate on the outturn until after harvest. It is well known that even in harvest these winds have thrashed out more grain than did thrashing machines.

The local wheat market continues to hold to strong prices, owing to a heavy short interest and stock of wheat under control. The stock in the State is placed at about 160,000 tons, of which 60,000 tons will be required for food. The 100,000 tons over even without an export demand is no more than the average carryover for three years past.

An Eastern paper says that the duties in France, per provisions of the bill just passed by both branches of the French Legislature, are 26¾c per 60 pounds of wheat and $1.42½ on each 196 pounds of flour. It is understood this will go into effect immediately. It is expected to encourage the French farmers to enlarge the area of land for wheat-growing, in a year or so requiring less imports of foreign wheat and flour. There will, however, be considerable foreign wheat required in France during this crop season. The French wheat crop of 1886, per official report, was 299,000,000 bushels. The annual average requirements of France for ten years have been 341,943,100 bushels of wheat. The imports of foreign since August 1 last have been about 20,000,000 bushels. In the south of France comparatively little wheat is grown. The latest Paris advices state that considerable foreign wheat will require to be imported between April and August 1, probably 20,000,000 to 25,000,000 bushels. The gross wheat imports of France for ten years have averaged 51,095,846 bushels, or about 41,000,000 bushels net. French stocks are small, less than 4,000,000 bushels in wheat and flour in bond on March 1, 1887. The Australasian wheat crop in 1886 was about 22,000,000 bushels, which was all required for home use except about 500,000 bushels exported to the United Kingdom. It is estimated that the crop of 1887 harvested in January and February will afford a surplus in the colonies of Victoria, South Australia and New Zealand of about 13,000,000 bushels, a large proportion of which will be wanted in the colonies of New South Wales and Queensland, thus greatly reducing the quantity for export to the United Kingdom, which may reach 5,000,000 to 7,000,000 bushels in the 12 months to end December 31, 1887. It would seem from the latest information from India that Europe's supplies from that empire may be fully 10,000,000 bushels of wheat less in 1887–88 than in 1886–87.

Barley has held to strong prices throughout the past week, with only slight fluctuations. All present indications point to an almost certainty that the stock is under control. The consumption is large and increasing. Crop prospects are good, but then the acreage seeded is all of one-quarter less than last year, while the consumption is all of one-quarter greater.

Corn is steady, with a firm tone reported. The demand is only moderate, but then the stock is not large.

Oats are firm for the more choice grades. The firmness is due more to the light supply than any increase in the demand.

Rye and buckwheat continue dull.

Feedstuff.

Bran and middlings are very strong, owing to the light output of the mills—several having shut down. Ground barley and feedmeal are strong, with a fair demand reported.

Private circulars are again advising holders to sell hay, claiming that low prices will rule. They did the same last June, when this paper took a contrary view—the circulars were wrong and the RURAL PRESS correct for prices advanced. Private circular are issued in the interests of the firm sending them out and not producers. The stock of hay is not large, while the consumption is very heavy, and the prospects for a large crop this year not of the best.

Fruits.

Strawberries are coming in more freely, causing prices to shade off. The crop will be very large and of excellent quality.

Present prospects for the fruit crop could not be better. Without some unforeseen event the yield will be all of 30 per cent greater than last year. This applies to both small and large fruits.

Choice limes are scarce and high.

Lemons are in good supply, but prices are firmly maintained.

Oranges are being sent East, where a good demand rules. Last week 12 carloads were sent from Sacramento. In our market receipts continue liberal, but all coming in find a ready market. The Florida crop is placed at 1,500,000 boxes, which is largely in excess of last year's.

The stock of dried fruits is light, causing prices to rule very strong. The demand continues good.

Raisins are steady for the more choice qualities. The demand is fair for the season. The stock here is light.

The first raspberries of the season were received on Monday last, and fetched $3 per drawer.

Vegetables.

New potatoes are coming in more freely, causing some shading in price. It is claimed that the acreage is largely increased, which if correct low prices must be expected. Old potatoes are barely steady at the advance, for the high prices restrict business.

Winter cabbages hold up well; this is due to free shipments. Last week one carload was sent from Sacramento to the East, while several carloads left here. Spring cabbages of the early varieties are coming in quite freely.

Green peas continue to rule low. The quality not being such as is wanted by canners cause them to be neglected by them.

Asparagus has fluctuated to some extent, prices having been controlled by the daily receipts and demand.

Other varieties of spring vegetables come in as yet sparingly.

Live-Stock.

Slaughterers report more selling pressure, owing to herders' desire to take advantage of the fat condition of their bullocks. The pasture is reported to be most excellent, allowing cattle to retain their fat condition. Mutton sheep are offering fairly free, with some shading reported on current quotations. The consumption is not as large as was looked for in this month. Dairy calves continue to be offered quite freely. Hogs are slow, except those suitable for the block. Milch cows appear to be in better demand. Horses are about the same as reported in last week's issue.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 9c; first grade, grass fed, 8½c per lb.; second grade, 7½@8c; third grade, 6½@7c.

MUTTON—Ewes, 6½; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8¼c; small, 5@8c.

PORK—Live hogs, 4¾@5¼c for heavy and medium; hard dressed, 7½@8¾c per lb; light, 4½@5¼c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

The tonnage movement compares with last yearat this date as follows:

	1887.	1886.
On the way	228,967	215,100
In port, disenga'ged	105,478	40,093
In port, engaged	6,339	38,921
Totals	340,774	294,114

The above gives a carrying capacity as follows: 1887, 545,238 short tons; 1886, 470,582 short tons; increase over last year, 74,656.

Wool moves very slowly, causing stocks to accumulate. Shipments now made are by steamer via Panama.

Dry hides are weak and hard to sell.

Hops are in fair inquiry, but the stock now here is light.

Choice, well-conditioned fowls are scarce and in good demand, as are young fowls.

Beans are dull, but firmly held, owing to the light stock.

Honey is scarce, and in request at full figures.

Dried fruits are firmly held, with stock growing lighter, under a steady demand.

Tallow is very firm.

San Francisco, April 20, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

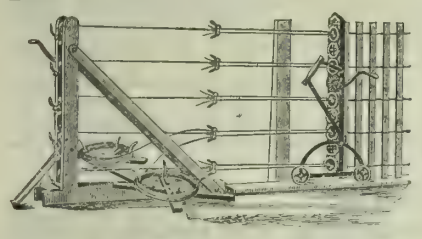
INSECTICIDE!

FOR ERADICATING AND DESTROYING ALL PESTS THAT INFEST FRUIT TREES AND PLANTS, SUCH AS

SCALE BUG, HARVEST FLIES, TREE HOPPERS, PLANT LICE, Etc.

It has been fully tested by the Agricultural Department of the State University, and pronounced a success, the endorsement of which we append. It is put up in convenient forms for use both in liquid and paste state.



For Sale in Barrels and 2 and 5-pound Cans in paste form, and in Barrels and 5-gallon Cans in liquid form.

Copy of Letter Received from the University of California, College of Agriculture, Berkeley, dated December 4, 1886.

J. N. KNOWLES, Esq., Manager Arctic Oil Works, San Francisco—DEAR SIR: We have lately tested the Insecticide preparation of Whale-Oil Soap sent by you to us, and have found it to be very effectual against the Scale infesting Orange and Bay Trees here; also against the Thrips. From our previous experience with a similar composition, I think it will be found fully effectual against any small Insect Pests not specially protected like some of the armored Scales, and against which any Wash short of strong lye cannot be used. Respectfully,

E. W. HILGARD, Professor of State University.

OFFICE, 28 California St., San Francisco, Cal.

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

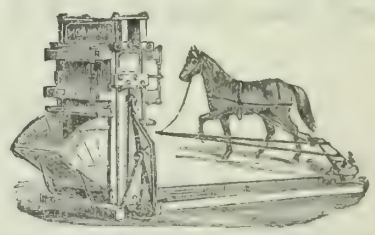
HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



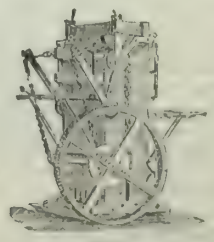
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**



THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**

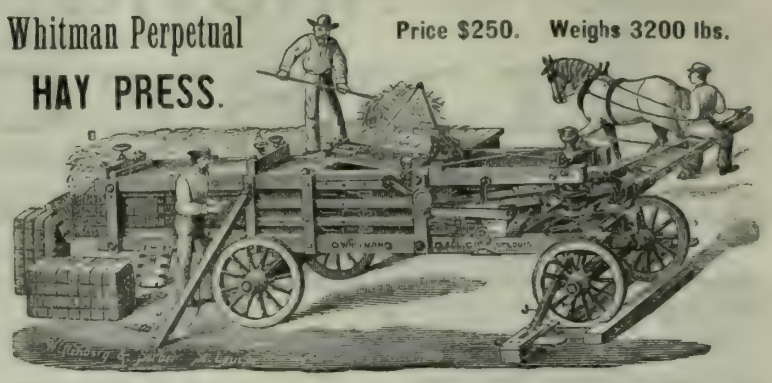
SPREADERS,
HIGH AND LOW DERRICKS.
LIGHT-WEIGHT FORKS,
STEAM FORK HOISTS,
IRRIGATING PUMPS,
ENGINES, WINDMILLS, Etc.

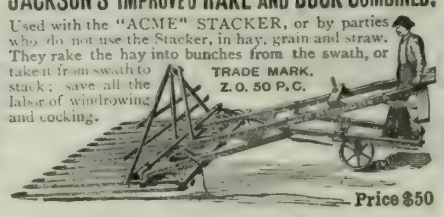
JACKSON HARVESTING MACHINERY.



Byron Jackson's Self-Feeder and Elevator, with Jackson's Improved Spreader attached, in combination with Jackson's Patent Folding Derrick, Light Weight Forks, Iron Pulley Blocks, and Bonds' Derrick Fork Hoist, are the most complete combination in use for passing headed grain from the stack to the Thrashing Machine. This outfit is universally used with Steam Thrashers, is so rapid and comfortable, and so much cheaper than other methods, that I deem it unnecessary to draw any comparison. The speed is limited only by the capacity of the Separator, or the power of the engine. The SPREADER is to the Thrasher what the governor is to the steam engine, completely regulating the supply to the cylinder, and overcoming all possible objection to the Self-Feeder. The Elevator, bringing the grain a considerable distance from one side of the Separator, together with the Low Derrick, Light Weight Fork, and DERRICK FORK HOIST, add greatly to the general convenience, ease, cleanliness, and comfort of the operators, reducing the chances of accident to men and machinery, and risk of fire from the engine.

PRICE, $5.00 EACH

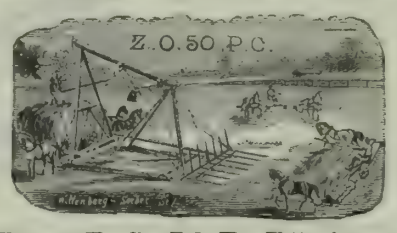
Whitman Perpetual HAY PRESS.



Price $250. Weighs 3200 lbs.

This Press is constructed of the best of materials and in first-class, workmanlike manner, which enables it to endure the great strain required. The power, which is entirely and fully protected by patents, consists of a bell-crank lever, slotted pitman and peculiar sweep or lever. The pitman is made of a combination of wrought iron, steel and wood, making it entirely proof against breakage. The bearings are all of steel, making the most durable machine in use. With the patent self-opening door a much larger charge of material can be placed in the press, and as it has more power than any other, it is much more rapid in its work. The bell-crank lever and slotted pitman are arranged with a series of holes in order that the leverage or power may be readily changed, so that one horse at the short hitch can press a bale to about the same solidity as two horses at the long hitch. It also has an arrangement by which you can instantly make the pitman and sweep rigid, for withdrawing the plunger in commencing operating, or in case the plunger may become fast from any cause.

JACKSON'S IMPROVED RAKE AND BUCK COMBINED.



Used with the "ACME" STACKER, or by parties who do not use the Stacker, in hay, grain and straw. They rake the hay into bunches from the swath, or take it from swath to stack; save all the labor of windrowing and cocking.

Price $50

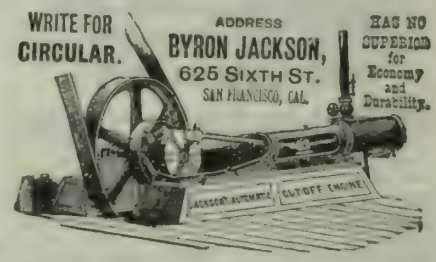
Does the work of all other Hay or Horse Rakes, viz., wire rakes, sulky rakes, revolving rakes, buck rakes and "go-devils." It rakes from the swath, and leaves the hay in large bunches at once, **requiring no hand-work.** One man and two horses will keep up with two mowers, following the mower as soon as the hay is wilted enough to be raked clean with any rake. It rakes **cleaner.** The hay will cure **quicker** without bleaching by dew or sun. Very large bunches can be made by pushing from two to six rakefuls into one.

If raked and bunched by my Improved "Acme" Rake, the hay is in very much better shape to reload and deliver on the Stacker evenly and level (loading the rakes all they will carry to the Stack), and spreads well over the stack, saving labor in stacking, because it has not been tangled, as it is when gathered with the sulky or revolving rake. Bear in mind that wind-rowing hay with any rake is labor thrown away, and is detrimental to the neat and most economical working of the "Acme" Hay Harvesting Machinery.

The "Z. O. 50 P. C." Acme

STACKER.

Price $100.



Weighs 1100 lbs. and Stacks 18 to 25 feet. Over 10,000 have been sold.

ADDRESS BYRON JACKSON, 625 SIXTH ST. SAN FRANCISCO, CAL.

HAS NO SUPERIOR for Economy and Durability.

This engraving represents one of the several styles of stationary engines which I build. I build all sizes for all purposes, and make a specialty of pumping and electric light engines. I build cabinet, or self-oiling engines, which require less skill and care than any other, and are therefore better adapted for use on farms, etc., where skilled help is not obtainable. I also build boilers, and am prepared to submit bids for steam-power plants from 4 to 200-horse power.

If you need an Engine or Pump, write me before buying elsewhere.

BYRON JACKSON,
625 Sixth St., San Francisco.

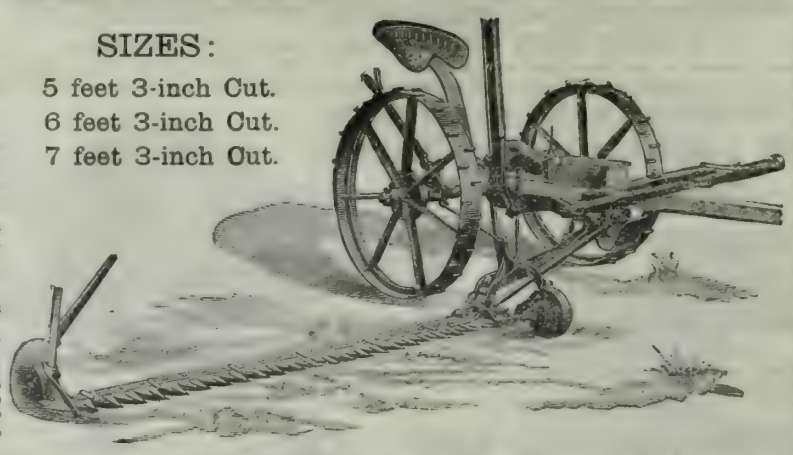
DEERING "GIANT" MOWERS

MANUFACTURED BY

WM. DEERING & CO., CHICAGO, ILL.

Very Strong, Very Economical, Very Light Draft.

THE "GIANT" found no grass in the heavy cutting of last season (1886) which it did not successfully handle; in several instances it was taken into grass that had been given up as being uncutable by other Mowers cutting only 4 feet, at the same time the "GIANT" was cutting a 6-foot Swath.



Intending purchasers of Mowers would consult their own interest by calling upon the local agent and examining into the merits of the "GIANT" before purchasing any other Mower. It is sold under a full guarantee, and intending purchasers are furnished the "GIANT" on Trial.

For doing an immense amount of cutting in a given time, and for leaving the grass in the very best shape for drying, the **Deering Front-Cut Giant Mower** has no equal. With its immense Cutter-Bar of 5 and 6 feet, it is well equipped to do almost **double** the amount of cutting that can be done by the common four-foot Mower, the only thing other factories have to offer to their customers. While the **Giant Mower** can do a giant's work, or about double that of the little Mowers, yet a team of ordinary horses draw it with ease day after day. In short, its draft is little if **any** greater than a common Mower. It is a continual source of wonder to farmers who see the **Giant** for the first time, how a Mower cutting such an **unusual** swath of 6 feet, can be pulled with so much ease by a small span of horses.

The whole secret of the wonderful light draft of the **Giant** Mower lies in the following four facts:

1st, and most important: The Cutter-Bar is supported by a strong **steel** spiral spring, so that the Bar does not rest heavily upon the ground, nor drag with all its heavy weight upon the ground. If it be borne in mind that about 40 per cent of the draft of a common Mower is caused by the dragging of the Cutter-Bar upon the ground, it will be no cause of wonder that the **Giant,** by saving this loss of power,

SIZES:
5 feet 3-inch Cut.
6 feet 3-inch Cut.
7 feet 3-inch Cut.

can turn it to cutting almost double the width of swath done by an ordinary Mower. In addition to the economy of power, there are some incidental advantages. It is free from side-draft. There can be no side-draft if the Cutter-Bar does not drag upon the ground. Another advantage had by having a supporting spring, is that the driver is assisted in lifting the Bar by the spring. Still another advantage is the increased traction gained by throwing the weight of the Bar and Drag-Bar upon the wheels.

2nd. The **GIANT** pulls easy, because of its **High Drive Wheels.**

3rd. It pulls easy because of its **large** and perfect-fitting **gears.** In the Giant there is no gear-cutting nor gear-grinding. Every part fits perfectly.

4th. It pulls easy because the shafts are small where they enter their bearings.

We feel a just pride in the **Front-Cut Giant** for the remarkable record it has made since its first introduction. Every farmer who has written us speaks enthusiastically of its wonderful cutting powers, its light draft for two horses, and its freedom from side-draft.

The advantage of course in buying a Giant is **Economy.**

Ask the Deering Agent in your town, or address us for Special Circulars describing our machines in detail, with Illustrations.

Warehouse, 1021 to 1027 Bryant St., SAN FRANCISCO, CAL.

PACIFIC RURAL PRESS

TWENTY-PAGE EDITION.

Vol. XXXIII.—No. 18.] SAN FRANCISCO, SATURDAY, APRIL 30, 1887. [$3 a Year, in Advance; Single Copies, 10 Cts.

Forestry Societies.

We are glad to see in several neighborhoods a disposition to form forestry or tree-planting societies. In this way the beneficent work of the Forestry Commission can be localized and promoted, for we have no doubt but that the Commission will be glad to recognize local associations as tributary to its own, and to foster their work. By a law of the late Legislature, the powers and resources of the State Board were enlarged. Important work is to be undertaken against violation of timber laws, and in this direction the help of many local societies would make the State Commission Argus-eyed, and strengthen its position in the public mind. We believe the Commission intends also to extend its efforts in the publication of practical information tending to promote tree-planting, and perhaps to furnish some needed materials. A local association will enable the Commission to direct this work intelligently and to be sure of placing publications or materials in good hands. Take for example the last report of the Forestry Commission, which is an excellent publication. It could, no doubt, be furnished to members of local societies, and thus would reach many more people than would otherwise apply for it. We have many useful local societies in this State, but there is also abundant field for a fine list of forestry clubs or societies. We are glad to record the organization of such a society last week at Santa Maria, in Santa Barbara county. It is too late, of course, to plant this year, but it is none too early to secure membership and lay plans for next season's planting. It is proposed to secure subscriptions for the purpose of planting belts of timber across the valley, a half-mile or mile apart; also to set trees in other situations. To secure the trees the society proposes to plant tree seeds in quantity in a piece of land, the use of which is given to them by the owner. This will be a good idea if the nursery is well taken care of. Where such an enterprise does not seem feasible it will be easy to get tree-growers to contract to produce and set out trees very cheaply if a large quantity is contracted for. There are many ways in which any neighborhood may largely increase and improve its arboreal environment if residents will work together toward that end.

The Santa Maria Society organized last week by choosing the following officers and committees: C. W. Merritt, chairman; L. E. Blochman, secretary; Murray, Jr., treasurer. Committee on Finances: J. Kaiser, Dr. Bagby, Mr. Murray, Jr., and Dr. W. T. Lucas. Committee on Forestry: W. L. Adam, J. F. Goodwin, L. E. Blochman, E. Morrison, M. P. Nicholson and C. W. Merritt. Another meeting is to be held this week. We have one suggestion to make to our Santa Maria friends, that they make haste to round out their society by placing ladies in membership and on the officer list. The ladies are a strong and enduring force in such enterprising endeavors, and their aid should be courted.

The Del Monte Fire.—E. T. M. Simmons, late manager of the Hotel del Monte, is under arrest as the incendiary. It is charged that he set fire to the hotel in order to destroy the books containing the evidence of his defalcations. He was convicted of embezzling the funds of a savings bank in Pennsylvania 10 or 12 years ago and sentenced to prison, but was pardoned within two years and came to California.

Spanish Grapes in April.—In the Press for January 1st, we spoke of a sample of Almeria grapes, kindly sent us by Weinstock & Lubin, which had crossed the Atlantic in corkdust packing and came out in remarkable freshness. A portion of that fruit having been buried again in the corkdust, has been lying in our editorial rooms for the past four months. A few evenings ago we turned it out and found that, while many of the berries had rotted, and those that had not were much shriveled, there was still a considerable quantity fairly eatable. We noticed a slight puckery taste in them, however, which may have been due to the material in which they have lain so long, or to some change in the internal composition of the fruit itself.

The Oregon Railway and Navigation Co. has leased its railroad to the Union Pacific. This change of management is said to give great satisfaction in Portland, as the O. R. & N. Co. has been regarded as very oppressive in its freight charges, and the U. P. is expected to pursue a more liberal policy.

Mr. S. P. Blade writes the Rural from Daggett that a fine ranch in Death valley has recently been sold to parties from Los Angeles and Santa Ana. It is near what is called the Death Valley ranch.

A Freak of the Yucca.

To those crossing the Mojave, the yuccas are objects of constant interest. Their verdure in the midst of arid wastes is a great surprise. The strange and almost fantastic forms which they assume excite wonder and give full play to the imagination in investing them with grotesque significance. The correct form of the tree is upright, with quite a symmetrical arborescent outline; but their insecure rooting in the desert sand places them at the mercy of the frequent windstorms and they are seen distorted and misshapen. The engraving shows one of the most interesting of the freaks to be seen on the desert. The top has evidently proved too heavy for the trunk, and it has gradually sunk to one side until it has returned to the plain and become imbedded in the sand. Storms have no doubt contributed to this result, but the trunk was too strong to break and the rooting too secure to let go its hold, and the result is that the tree assumes arch form, and now, braced at both ends, bids fair to defy the elements for years to come.

Photo. and Copyright by C. R. Savage.

CURIOUS GROWTH OF A YUCCA ON THE MOJAVE DESERT, CAL.

Our engraving is from a copyrighted photograph by C. R. Savage, now a resident of Salt Lake City, and our reproduction is by his special permission. The arch is broad enough to allow several horsemen to ride abreast beneath, and its hight, as shown by the figure of the man, is probably from 12 to 15 feet at the apex. From the upper surface, as the picture shows, a single branch has approached the vertical as nearly as possible, and may yet form quite a tree-head at this point.

This yucca of the Mojave is the tree from whose trunk most excellent pulp is obtained for paper-making, and its manufacture is now being carried on by an English company, furnishing paper stock for the London *Telegraph*, as has already been described in our columns. The *Telegraph* made a wide study of paper-making materials in various parts of the world, and decided upon the yucca of the Mojave as the best source obtainable.

Lake County has appointed men to solicit subscriptions for the $75,000 bonus asked by the San Francisco and Clear Lake Railroad.

HORTICULTURE.

The Riverside Convention.

(Concluded from our last.)

In accordance with previous announcement, the citizens of Riverside, with their wives and families, met at the Pavilion on Tuesday evening, in public gathering, to give an opportunity for their visitors from abroad and the members of the convention to become better acquainted with each other, and to have an hour or two of social enjoyment. The hours were very pleasantly spent in reviewing and discussing the merits of the splendid fruit on exhibition—the cold-storage question—as exemplified by the exhibit, etc.

The Convention an Open One.

It may be remarked in this connection that the conventions are essentially open meetings, held simply under the auspices of the State Board, at which any fruit-grower, or any other person in fact, who is interested in the industry of fruit-growing, may participate in the discussions. The object of the meetings is to bring out facts and experience from any and all sources by which the great industry of fruit-growing may be benefited. It is also one of the objects to create a greater interest in the matter among our citizens generally. The subjects discussed are all of vital interest to this great industry, and to the welfare and material progress of the State in general.

It is to be regretted that the citizens of Riverside generally, and the people from the southern counties generally, have not taken a greater personal interest in the matter and made it manifest by a more general attendance upon the meetings. But, as was remarked by President Cooper in his opening address, the chief reason why the people of Riverside and vicinity failed to take a more general interest in the matter was, because the questions chiefly discussed did not concern them; they have no insect pests, and therefore have no interest in learning how to get rid of them. Their orchards and vineyards are clean—root and branch.

Wednesday's Session.

The convention after coming to order, on motion of I. A. Wilcox, passed a vote of thanks to Prof. Riley for his valuable and instructive address.

Mr. Block gave a report of the committee in regard to a reduction of the rate on fruit shipments to the East. Messrs. Crocker and Huntington were disposed to comply with their request, but Mr. Stubbs was stubborn. Then they applied to the Chamber of Commerce, which telegraphed to Washington. Mr. Stanford replied that the concessions should be made unless good reasons existed to the contrary. Mr. Towne assented if the Interstate bill did not interfere. No positive answer is yet received. Mr. Block thought we should aid with the Fruit Union to hold Mr. Towne to his promise.

N. R. Peck, of Placer, offered the following:

Resolved, That all associations and persons interested in the growth and development of the fruit interests of the State are requested to use their individual and combined influence, by petition to the Interstate Commission, to provide the relief in transportation so necessary to the very existence and future advancement of fruit culture in California.

Mr. Wilcox urged combination. Two years ago we paid $800 a car for fruit sent East. Soon we got cars for $600. This and other concessions were only won by combined effort. The Interstate law is all that now stands in our way.

Dr. Kimball wanted all unions shipping fruit to co-operate. The resolution was then adopted. The following resolution, drawn up by Dr. Chubb, was then read by the secretary:

Resolved, That a committee of three be appointed by the President to prepare a memorial to Congress setting forth the needs of this coast in the matters of exterminating insect pests, and asking an adequate appropriation to be used by the Division of Entomology in the Agricultural Department of the United States in the investigation of the parasites and predacious insects of the white scale and all injurious scale insects in its native country—Australia, and their introduction to this country.

The resolution was adopted by the convention.

The excellent suggestion of Mr. Block that each representative and senator be sent a copy did not receive action.

At this point the essay by Mr. A. S. Chapman, of San Gabriel, was called for and was as follows:

Fertilization of Orange Orchards.

Plants feed on the same elements, but in varying proportions. Among the most important may be mentioned phosphoric acid, potash, lime, magnesia and nitrogen, which are found only in small available quantities in the soil, although they may exist in large quantities in an unavailable condition.

According to Prof. Johnson, "from 95 to 99 per cent of the entire mass (weight) of agricultural plants is derived directly or indirectly from the atmosphere."

"And from the atmosphere the crop can derive no appreciable quantity of those elements that are found in the ash."

To the soil, therefore, must we look for our supply of plant food, by rendering available the inert material, and when that quantity is too feeble to supply artificially what it be deficient in.

The soils of Southern California, Prof. Hilgard says, are generally deficient in phosphates—a most necessary constituent of plant food and generally the first to become exhausted. They are, as a general thing, rich in potash. The supply of nitric acid, the conveyor of nitrogen to the plant, depends greatly on ourselves. Nitrates are formed by the oxidation of ammonia in the soil, derived from the slow decay of organic matter, and proceeds most rapidly at a temperature of 70 to 80° F., which accounts for an abundance of acid in the summer and a lack of same in early spring. The formation of nitrate of potash is a most interesting study to the farmer. Only within the past few years has it been discovered that the nitrate is formed through a fermentation produced by bacteria, in the presence of humus, lime and potash.

The carbon of the plant is derived through the leaf from the carbonic acid of the atmosphere; therefore may weeds become beneficial to the soil. By being matured and plowed under they keep the soil in a fine mechanical condition, retentive of moisture. They supply nitrogenous material for oxidation into nitric acid. They supply the water of the soil with carbonic acid, which has a "high solvent power on the carbonates of lime, magnesia, protoxide of iron, and protoxide of manganese. When carbonated water comes into contact with siliceous minerals they are decomposed much more rapidly than by pure water."

The general mode of fertilizing in this country seems to be principally tillage, with an occasional dressing of some manure once every two or three years, and copious irrigation. Now it would seem that this constant irrigation with pure water, as it is in the San Gabriel valley, would wash from the soil its soluble salts, not only depriving it of them but to an extent leaching and making the soil less subject to hydroscopic water. And again, when thorough tillage is resorted to, to the exclusion of manure, it stimulates the soil beyond the power of endurance, its vegetable mold is rapidly used up, the available phosphoric acid reverts to an insoluble condition, and the soil thus left in its primary condition is subject to bake and form hardpan. And again, where heavy manuring is resorted to, say once in three years as is sometimes done here, then do parts of the plant food revert to an inert form and the great quantity of organic matter becomes acid and sours the soil, unless it be an exceedingly calcareous one.

On my father's place at San Gabriel we choose to manure lightly and often by shoveling sheep manure into the irrigating ditches, allowing each tree to receive about 25 pounds at each separate irrigation. Our basins cover the entire surface of the ground. We make no effort to choke such weeds as clover, alfileria and the like; but the irrigator with his hoe destroys the obnoxious nightshade, horehound and nettle.

In the fall of the year we follow with a copious liming—about three barrels of unslacked lime to the acre—applied in the following manner, at the head of our irrigating ditch: We plant a box about three feet wide, six feet long, two feet deep and six inches under the surface of the running water. In it we place a barrel of the lime. It slacks and swells to twice its original bulk. A man stands on this with his hoe and sees that the water carries it off evenly. With an irrigating head, such as we use, a man will run into the ditch four barrels a day, or about three barrels to the acre.

We now leave the orange orchard till spring, when we plow under weeds, manure and lime. We thus aim to supply our soil with nitrate of lime, potash and magnesia. Carbonic acid gas is absorbed by the water and attacks the inert plant food in the soil; hardpan is prevented both by the mechanical effects of the vegetable matter and the lime.

The Allegretti Process.

The president then took up for discussion that portion of the program under which the different processes for the preservation of fruit in shipping belonged, and called upon the secretary to read the letter written to the convention by Mr. Allegretti, describing his patent process for the preservation of fruit.

WEST BERKELEY, April 9, 1887.

To the President and Members of the Horticultural Convention and Citrus Fair, assembled at Riverside April 11, 1877:

Mr. President and Gentlemen of the Convention: Noticing that the second subject of discussion on your program is that of preparation, marketing and disposing of fruit, and being in possession of some facts that I believe to be of great value to the fruit interests of this coast, and bearing principally on those points, I have taken the liberty, and this means (being unable to attend personally) of laying them before you, and will do so in as few words as possible.

After 20 years of experimenting and study, I have perfected the process known as "The Allegretti Air-Purifier and Preserving-Room System," which is secured and covered by three different patents. It consists of building a receiving-room or treating-house of any capacity agreed upon, in which the fruit can be stored and treated, just as it comes from the orchard, without changing the original package or box; the time required for treating is from one to five days, according to the quantity; fruit so treated can be put on fruit car without any other preparation, and will keep from six to eight days.

When a longer period is needed in transit, say from 8 to 16 days, the car can (at a trifling extra expense) be so prepared that it will keep the fruit that length of time. If it should, however, be desired to ship the fruit as ordinary freight, then the car could be so prepared—after the plan of the treating-house—so that a 30-days' transit would be no injury to its contents; again, should the market at that point of destination be glutted, a receiving-house might be built into which the cars might unload, and their contents be held for a better market.

These treating-houses can be built at any place desired, and after instruction are easily managed.

One of the advantages of which is, that the fruit may be picked as it ripens, put into the treating-house and kept there, in its perfect, natural state until there is sufficient to load a car if so desired.

The principal item of expense in this system is the building of the treating-house, which will vary according to its capacity; the cost of treating the fruit, especially in large quantities, being nominal; smaller lots, say from 10 to 20 tons, will not exceed one-quarter of a cent per pound.

Fruit preserved by this process differs from that preserved in refrigerators, in the fact that the latter commences to decay almost immediately after it is taken out, while the former will stand longer even than when first picked from the tree or vine, as the case may be.

For the corroboration of the above facts, I respectfully refer to Messrs. A. T. Hatch, Suisun; C. F. Crocker, San Francisco; W. W. Smith, Vacaville; Dr. Strentzel, Martinez; I. A. Wilcox, Santa Clara; and Professor E. W. Hilgard, of the University of California. Any further information on the subject will be cheerfully given upon application.

Yours most respectfully, I. ALLEGRETTI.

Cold Storage.

Mr. Stowe, of the Interocean Cold Storage Company, was then requested to present facts concerning his methods. He accordingly gave an interesting statement of the work as done by his company. It was the elimination of the moisture from the rind of the fruit as much as in the cooling of it that effected such satisfactory results. There was no secret about their process. There was the fruit, which the convention could examine after its 62 days' storage. Some of it, after 48 days' storage, had been taken out into a temperature of 85° or 90°, and after 16 days' exposure to all kinds of temperature could now be examined. Not a specimen but was as firm and excellent as when put in. This was an effectual answer to the statement that fruit taken from cold storage would "go down" on exposure. The fact was, moisture and heat caused decay. The extraction of moisture made it possible to save all the length of life of which the fruit was possessed when it went in.

Committees Appointed.

The following special committees were appointed to-day to report to-morrow: Committee on Cold Storage—L. M. Holt of Riverside, Dr. O. P. Chubb of Orange, I. A. Wilcox of Santa Clara, N. W. Blanchard of Santa Paula, Ventura county, and W. B. Ewer of San Francisco, one of the publishers of the PACIFIC RURAL PRESS.

Committee on Fruit Exhibit—E. W. Holmes of Riverside, A. S. Chapman of San Gabriel, and Rev. N. R. Peck of Placer county.

Dr. Woodhill placed on exhibition this morning the silk produced in Riverside the past season, by silkworms fed on osage orange leaves. It has attracted much attention. The cocoons were sent to the State filature, where they were reeled, and the reeled silk returned, as beautiful a specimen of that product as can be found anywhere.

Thursday—The Last Day of the Session.

On calling the convention to order this morning, President Cooper expressed the hope that the convention might be able to conclude its labors by 11 o'clock A. M., as several members were anxious to take the afternoon train for Los Angeles.

The first thing in order was the reading of the report of the Committee on Cold Storage. The report is quite lengthy and instructive. It sets forth the value of cold storage, for both oranges and lemons, in a manner which cannot fail to attract the attention of orange-growers throughout the State. So far as experience has thus far shown, it is one of the most important factors yet introduced in the keeping and transportation of citrus fruits. We shall publish the report entire at an early day.

The Committee on the Fruit Exhibit was next called upon for their report. The substance of this report will be given in our editorial report of that exhibit, which will probably have to be deferred until our next issue.

The Next Meeting—A Speech by General Vallejo.

In regard to the next meeting of the convention in November, it was voted that the matter be referred to the action of the State Board. Mr. Wilcox extended an invitation to the convention to meet at San Jose. Gen. Vallejo extended the same invitation for Santa Rosa or any other town in Sonoma county.

The General made a very happy and interesting speech of considerable length, in which he expressed the pleasure he had enjoyed in meeting with the fruit-growers at Riverside. He was now here for the second time in his life. His first visit to the San Gabriel and San Bernardino valleys was made over 60 years ago. He was then on a military expedition and was accompanied by Father Boscano. He instituted a comparison between what he saw then and now. At that time the country seemed to be full of stones and thorns—desolate and almost uninhabited. It was purgatory; it was now a veritable Garden of Eden. The change from that time to the present seemed to him like an Arabian Nights' entertainment. In looking at the large golden fruit displayed upon the tables in the Pavilion, rivaling in size anything of the kind he had elsewhere seen, it seemed as if the people of Riverside had been grafting oranges on pumpkin-vines! The General's speech was received with much applause, mingled with mirth. Several other short speeches were made during the closing hours.

Apologies were made by Mr. Holt and Rev. Mr. Deere for the slim turnout by the citizens of Riverside. The latter in a humorous vein depicted the aversion of the average Riverside to anything which looked like a cloud or felt like a mist. [It had been raining more or less during the last two days of the session.] A Riverside audience never materialized if it had the excuse of a sprinkle; nothing but clear sunshine would bring them out from their shady orange groves in great numbers.

A Compliment for Riverside.

Mr. Block, of Santa Clara, complimented the people of Riverside upon the absence of one pest, which was quite general in most other parts of the State—the liquor saloon. Mr. Holt remarked that the remedy for that pest was a city license of $2000 a year, and a county license of $300. The solitary saloon in Riverside paid $2300 a year for the privilege of existence.

Just before the motion was made to adjourn, Mr. Block moved, and it was unanimously carried, that the convention tender a vote of thanks to Mr. L. M. Holt, of the Riverside *Press*, for his efforts in behalf of the convention. A similar motion was also made and carried in behalf of Mr. LeLong, of Los Angeles, for his valuable services in the same direction.

We would take this occasion to express our personal thanks to Mr. Holt for various attentions during our stay at Riverside. The convention adjourned at 11 A. M.

DEATH OF A PIONEER ORCHARDIST.—Joseph W. Briggs, the well-known orchardist of Alviso Township, died at his residence on the Trimble road, about two miles north of this city, Tuesday evening. Mr. Briggs was a native of New York, 54 years of age. He came to California from Ohio, with three of his brothers, in 1850, and settled in Marysville, where they planted the first orchard ever set out in California. In 1870 Mr. Briggs located in this county on the place where he died. It consists of 120 acres and is one of the best orchards in the State, and contains about 10,000 fruit trees, including nearly every variety. A wife and three grown sons remain to mourn the loss of a good husband and father.—*San Jose Mercury.*

THE APIARY.

Securing Swarms.

EDITORS PRESS:—In the first place, I look through all my queens early in the season, and clip part of one wing. My hives are about four inches from the ground. When the swarm comes out, I look for the queen in front, on the ground. I give the bees all possible egress at the entrance, to get them all out quickly. Finding the queen, I put her in a cage and place the cage in the shade; I then remove the hive, or face it the opposite way, at the side near the old stand. I then place a new hive on the old stand with empty frames, giving one of the old combs containing unsealed brood in the center.

Now for the bees. I use an empty starch-box or something of the same size (12-pound box). I fit a false end near the lower end (of one inch stuff) just the size of the end, giving about two-inch space. I then fit a pole (old rake-handle or something similar) through the ends, and drive a nail through both outside parts, to keep the pole and box from slipping. One side of the box is open; on the other three sides, I bore five or six inch holes around a central hole. I now am ready for the swarm. In case I find that they are not settled, I shake the bees from those combs that are not sealed, in front of the hive, saving enough to cover the brood in the old hive. Sometimes the bees hearing the humming near the hive will return, and cluster in front of the hive, then by letting the queen loose, and seeing her go in at the entrance, the bees will soon find it out and hive themselves. The next day, give them all combs necessary, and as soon as they get fairly at work put on the sections, and they will soon find them to store their surplus. I like to get the queen laying in the brood combs before putting on sections. Should the weather be cool, the sections should be delayed a little longer.

But I am not keeping to the swarming. In case the bees cluster, or commence to, take the box, which I call a swarming-box, go to the bush or place of clustering, let them gather in a small bunch, then jar the bunch in the open part of the box, and turn the mouth gently downward, holding it close to the bush among the flying bees. Let a few gather on the outside of the box; they will go inside through the holes. Now gently shake the limb where the first gathered and move the box gently away. The humming in the box will attract the bees in the air and all will cluster there. When all is quiet, you can pour or shake them over the frames. Place an empty sack over the bees and jar the remaining bees on the ground, in front of the box. Look for the queen. See that she goes inside, if not already there, and your swarm is hived. There will not be any bees return to the bush if you don't let them cluster too much at first. Any one can make the swarming-box.

Occasions of Disease in Horses.

Editors Press:—Prevention is better than cure. There is no doubt that a moderate climate is more agreeable to the health of the horse than extremes; at the same time he is better able to stand extraordinary heat than cold. I have noticed in Canada and other cold countries that horses, when attacked with inflammation, in a very short time succumb to its effects. It is very common to hear people say, "Be careful if your horse gets '*heated up;*' let him 'cool off' slowly." They have found out practically that this cooling off means congestion of some internal organ. The surface of the body cools, that is to say, the warmth and blood is thrown inward, and the result frequently is that some organ, generally the lungs, becomes congested and ultimately inflamed. But there is a hint here which may with advantage be mentioned, and that is, do not put on the blankets until the animal has "steamed off," as they say in Canada, otherwise the blanket becomes saturated with the moisture from the body, and this wet covering is by no means comfortable, and is likely to cause the trouble which the owner tries to avoid. Not long since, a very valuable horse was brought to me, suffering from rheumatism, which showed itself first in one forelimb and then in the opposite shoulder. This disease was clearly traced to damp stables and improper care in clothing. Iodide of potassium was administered, moderate exercise ordered and the animal to be placed in warm and dry stables, and the rheumatic parts to be well rubbed morning and night with a stimulating embrocation and warm bandages applied. He got much better and was sent out again to do his ordinary work, but he was for some time liable to attacks when the weather was damp or changeable.

Eye Parasite.

In India, horses are liable to a number of troubles arising from the bites of insects. But there is one ailment, that occurs to my mind, which is interesting to me as a veterinarian, but very annoying to the poor animal. It is due to the parasite which is found actually in the eye; it floats in the watery or aqueous portion of that organ. And the only method of cure, and it is effectual, is to puncture with a very small lancet the front part of the eye—the cornea—and allow the worm-like parasite to flow out of the orifice, with the water or aqueous humor. This liquid is formed again, and the cavity closes up, and the eye assumes its natural appearance.

Shoeing.

Shoeing may not seem to some people a very important matter, but to those who have much to do with horses, it is well known that it is the cause of almost all the lameness that exists. If the shoe does not afford an equal pressure all over the surface of the foot, it is easy to understand that one side or part of the limb must suffer in consequence. Owners of horses, whether merely inclined to look upon this noble animal as a mere "working machine" or on the other hand if they are of the horse, horsey, would do well to pay more personal attention to the shoeing of their animals. If the blacksmith makes the shoe to fit the foot, all is well; but if he, as he frequently does, makes the *foot to fit the shoe*, all is wrong. Corns, splints, spavins, etc., are the inevitable consequences. In my practice, horses are frequently shown to me with their heels extremely contracted, due to allowing the shoe to remain too long without removal, and sometimes also it may be traced to the shoe having been put on and not enough room at the heel left for expansion. In these cases the treatment consists of *removing the cause* and cultivating the growth of the frog. This necessary appendage of the foot, termed the frog, was undoubtedly intended by Nature to prevent concussion and assist expansion. With my own horses, I never allowed the blacksmith to touch the frog, except very gently *with the rasp*, only just sufficient to remove the dead material.

Abuses of Horses.

There are some interesting diseases noticed in those animals employed in coal mines. The eye probably suffers more than any other organ; blindness is often the result. Bruises to the head and other parts of the body, when on the head are termed "poll evil," but the miners try to avoid this as much as possible by applying a leather protection over the front and back of the poll. And now that the subject of preventing diseases in horses is upon my mind, I intend to say a word about something which I may plainly call an abuse and cruelty, and it is used more in California than most other places. I allude to the use of the *curb rein* or *check-rein*, checking up the poor animal's head in the most unnatural and painful manner, and causing diseases of the muscles of the larynx. I suppose I shall offend some by making these remarks, but I am passionately fond of horses and intend to stand up for their rights, at all risks. Any one accustomed to the evidences of pain shown by the horse will very plainly and at once recognize them in the way in which he slowly throws his head from side to side, and the thankful expression of face and the stretching out of the neck and head when the poor animal's head is released from that tying-up method—the check-rein.

After-Effects of Pneumonia.

Allow me here to caution those who are intending purchasers of horses to be very careful not to buy any animal that has had pneumonia, as, if any vital organ has once been inflamed, it is much more liable to again become inflamed with any slight change of the weather. And again, there is frequently some consolidation of the lung substance which interferes with his future usefulness. A friend of mine lately was away from home and bought an animal such as I have described, and having soon afterward driven him an ordinary journey, the horse was again taken with pneumonic symptoms and died.

In conclusion, perhaps I may be allowed to say that one other thing that I frequently notice is that people dose their horses *continually* with medicine. This is actually hurtful; it is time enough to give medicine when they really need it.

Robert J. Dawson,
Veterinary Surgeon.

Sheep and Wool.

The Sheep and Wool of the World.

The recent report of the agricultural bureau, says the Boston *Advertiser*, places the number of sheep in the United States at 44,759,314. This is probably an underestimate, since it does not include the ranch sheep of some of the Territories; but even if the flocks of the United States did not exceed the agricultural department's figures they would still surpass those of most other nations, and would show the great importance of the wool interests of our country. From the latest statistics of sheep husbandry in Australia we find that the aggregate number of sheep in the five provinces of that continent is 62,609,667. More than half of these are in New South Wales.

In New Zealand the number of sheep at last accounts was 14,624,547, and in Tasmania, 1,648,627. In Africa the principal wool-growing colony is the Cape of Good Hope, where there are 11,279,743 sheep, yielding the "Cape wool" which is imported into the United States to some extent. There are also 5,056,301 sheep in the Orange Free State, 535,482 in the Natal colony and 6,056,683 in Algiers. The number of sheep in Algiers is decreasing, the total reported in 1880 having been 6,992,218.

In South America, there are 75,000,000 sheep in the Argentine Republic, 15,921,069 in Uruguay, 3,490,563 in Venezuela and 516,975 in the Falkland islands. Unfortunately, we have not been able to obtain statistics of sheep husbandry in Brazil. Next to Australia the severest competition of American wool-growers comes from Uruguay and the Argentine Republic.

Much wool is brought into the United States from Russia, but it is mostly of a carpet grade and does not compete with our domestic fleeces. The number of sheep in European Russia is about 49,000,000. The number of sheep in Great Britain and Ireland is 28,955,240. Germany has 20,000,000, France 22,616,547 and Austria-Hungary 14,500,000. Spain has 17,000,000 sheep. The number of sheep in all European countries, according to the latest figures obtainable, is 212,332,361. Canada has about 3,000,000 sheep, mostly of the long-combing wool variety.

Statistics of sheep husbandry in Asia are, of course, very imperfect. The number of sheep and goats in India is 14,387,000. The number of sheep reported at last accounts in Caucasia and Transcaucasia, in Asiatic Russia, was 10,000,000.

From such statistics as are obtainable, therefore, we should estimate the total number of sheep in the world as follows:

South America	100,000,000
Australasia, including New Zealand	77,000,000
Europe	212,000,000
Africa	25,000,000
Asia	50,000,000
United States	45,000,000
Canada	3,000,000
All other countries	5,000,000
Total	517,000,000

Many of these animals, however, though designated as sheep, grow hair instead of wool. The fine fleeces of the modern domestic sheep which have taken the place of the hair of the primitive ovine are largely the result of careful breeding and culture. This is a very suggestive fact for economic writers who are inclined to write about wool as though it grew without any care or attention.

The Woolmen's Protest.

The following is the statement sent to the Interstate Commerce Commission, to which allusion was made in the Rural of April 16th:

San Francisco, April 14, 1887.

Hon. T. M. Cooley, Chairman Interstate Commerce Commission, Washington, D. C.: At a special meeting of all parties interested in our wool trade, representing dealers, commission merchants and wool-growers, we were appointed a committee to petition your honorable body to suspend the operation of Section 4 of the interstate commerce law in the transportation of wool by rail from this State to Boston, New York, Philadelphia and other through shipping points. The established rate of 3.70 cents per pound is excessive and prohibits shipments overland. The wool production of this State amounts to 40,000,000 pounds per year, and the difference between the old and new rates of freight involves a loss of over $1,000,000 annually to the grower. Our wools are sold the last at the market.

The higher rates mean no higher prices to the consumer, but lower net results to the grower, because the prices of the Eastern markets are based upon the necessity of sending our wool there whether we pay high or low freight.

We cannot realize an average of more than 20 cents per pound for our wools there. The expenses based upon the present charges for freight, not including local charges, amount to about six cents per pound, leaving less than 14 cents net to the wool-grower. The average yield of wool per sheep is about seven pounds per year. Fourteen cents per pound for the wool gives the grower 98 cents per head annually for the product of his sheep. The expenses of maintaining our flocks amount to about 75 cents per head, and if we add the local charges in handling the wool here there would be nothing left. You can readily see, therefore, that we cannot afford to pay 3.71 cents per pound to market our wool. It is the opinion of your petitioners that if those rates are continued the existence of this industry will be annihilated. The suspension of Section 4 in favor of our wools would be a benefit rather than an injury to this industry in other States. Owing to our mild climate we shear early in the spring, and our wool by rail reaches the East in May and June, when the market is bare of wool, and we dispose of it before other wools are ready for market. But if we are compelled to ship by sail, at the end of four months it would come in competition with the wools from all other portions of the country, and any deficiency in the early market would be supplied by foreign importations, when we ought to be in a position to supply the demand.

The wool interest in this State is a very large and important one, and more particularly affected at present by the operations of the new law than any other branch of business. Our spring clip is now ready for shipment, and it is necessary that we should get it to Eastern markets in advance of Western territory wools, which we cannot do by water transportation. Companies should be allowed to make such competing rates with the water routes as will enable the wool-growers to avail themselves of rapid transportation across the continent without submitting to the ruinous rates as now established, which can only result to the advantage of the transportation companies, and to the injury of the producer without any benefit to the consumer. The railroad rates now charged are more than six times the rates of last year and more than four times the present rates by sail, and nearly double those charged by the Canadian Pacific. The route by Cape Horn, while the charges are reasonable, involves a loss of four months, a large amount of interest on the money invested, and would necessitate an entire change of business relations long established in handling wool between here and Eastern points.

Before the passage of the interstate commerce law, 90 per cent of our wool went overland.

We handled also a large portion of the wool from the adjoining States and Territories which would gladly come here now, but cannot, owing to the excessive railroad freight charged, and if we are compelled to ship via Cape Horn we lose the advantage of the early Eastern market on account of the long voyage, and you virtually help the foreign importer at the expense of the domestic producer. We do not believe that it was the intention of Congress in passing this law to seriously cripple this industry. This is shown by its having enacted from time to time suitable tariff protection, which is now offset by these heavy freight charges which we are called upon to pay under the operation of the Act, and we cannot believe our Government wishes to force the transportation of our wool through foreign countries to secure lower rates of transportation than our roads are allowed to charge, when said roads are ready and willing to give us satisfactory rates if only allowed to do so.

It is clearly to the interest of our people that the labor and capital of our own interest should get the benefit of the money which we would have to pay to foreign corporations for freight and charges which would amount to a very large sum if we are unable to secure competing rates from our own railroads.

Our only relief is the suspension of Section 4 as far as the same applies to wool and pelts, and we earnestly and urgently petition your honorable body for its immediate suspension to enable us to market our wools at once, which are rapidly accumulating.

J. P. Hulme,
J. E. Shobert,
Eugene Avy,
R. F. Parks.

The Vineyard.

Making Unfermented Wine.

A subscriber to the *Bulletin* appeals to the wine makers of California, as follows:

Gentlemen: Believing that you are not blind to the best interests of your kind, and recognizing the great and growing wine interests in the State, and also the great and growing temperance army, who need some safe, pleasant, unalcobolic drink for the table, and as a healthy beverage, I seek to bring this want and supply together. For this purpose I ask you to put up some unfermented wine—that is, the pure juice of the grape, with no deleterious substance in it. Having all the facilities, you are the proper persons to experiment in this direction. The article sought will be found. Demand and supply always keep company. Suppose you try some of the methods already used by private families, until some better ways are discovered. One of these methods is pasteurizing the juice by heating to 160°, and keeping it there for some time; then filtering or straining it, and again heating to 160° before bottling. It should be put in the bottles hot. To be sure of killing all the germs, the bottles may be washed out with salicylic acid, and the corks to be thoroughly disinfected, may, when closing the bottles, be taken from a hot salicylic solution. No salicylic acid should ever be put in the wine, as its use is opposed to the healthy action of the stomach in the process of digestion.

The reward offered to him who shall discover the best method of preserving unfermented wine is a fortune for himself and an everlasting benefaction of mankind.

The Public Lands.

New Regulations For Land Entries.

The following circular has been issued by the Commissioner:

Department of the Interior,
General Land Office.

Registers and Receivers, United States Land Offices: From and after the 15th day of April, 1887, you will not recognize any attorney or agent for claimants or other parties to any proceedings before you, until he has complied with the following regulations:

1. An attorney-at-law who desires to represent claimants or contestants before your office shall file a certificate, under the seal of a United States, State or Territorial Court for the judicial district in which he resides or the local land office is situated, that he is an attorney in good standing.

2. Any person (not an attorney-at-law) who desires to appear as an agent for claimants or contestants before your office must file a certificate from a Judge of a United States Court, or of a State or Territorial Court, having common-law jurisdiction, except Probate Courts, in the county wherein he resides or local office is situated, duly authenticated under the seal of the court, that such a person is of good moral character and good repute, possessed of the necessary qualifications to enable him to render clients valuable service, and otherwise competent to advise and assist them in the presentations of their claims or contests.

3. The oath of allegiance required by Sec. 3478 of the United States Revised Statutes must also be filed by applicants. In case of a firm, the names of the individuals composing the firm must be given, and a certificate and oath as to each member of the firm will be required.

4. An applicant to practice under the above regulations must address a letter to the register and receiver, inclosing the certificate and oath above required, in which letter his full name and postoffice address must be given. He must state whether or not he has ever been recognized as an attorney or agent before this department, or any bureau thereof, or any of the local land offices, and if so, whether he has ever been suspended or disbarred from practice. He must also state whether he holds any office under the Government of the United States.

After an application to practice has been filed in due form, the register and receiver will recognize the applicant as an attorney or agent, as the case may be, unless they have good reason to believe that the person making the application is unfit to practice before their offices, or unless otherwise instructed by the commissioner or secretary.

Registers and receivers must keep a record of the names and residences of all attorneys and agents recognized as entitled to represent clients in their several offices.

Every attorney must, either at the time of entering his appearance for a claimant or contestant or within 30 days thereafter, file the written authority for such an appearance, signed by said claimant or contestant, and setting forth his or her present residence, occupation and postoffice address. Upon a failure to file such written authority within the time limited, it shall be the duty of the register and receiver to no longer recognize him as attorney in the case.

An attorney, in fact, will be required to file a power of attorney of his principal, duly executed, specifying the power granted, and stating the party's residence, occupation and postoffice address.

When the appearance is for a person other than a claimant or contestant of record, the attorney or agent will be required to state the name of the person for whom he appears, his post-office address, the character and extent of his interest in the matter involved, and when and from what source it was acquired. Authorizations and powers signed or executed in blank will not be recognized.

If an attorney or agent shall knowingly commit any of the following acts, viz.: Represent fictitious or fraudulent entrymen; prosecute collusive contests; speculate in relinquishments of entries; assist in procuring illegal or fraudulent entries or filings; represent himself as the attorney or agent of entrymen when he is only attorney or agent for a transferee or mortgagee; conceal the name or interest of his client; give pernicious advice to parties seeking to obtain title to public lands; attempt to prevent a qualified person from settling upon, entering, or filing for a tract of public land property subject to such entry or filing, or to be otherwise guilty of dishonest or unprofessional conduct; or who, in connection with business pending in local land offices, or in this department, shall knowingly employ as sub-agent, clerk, or correspondent a person who has been guilty of any of these acts, or who has been prohibited from practicing before the register and receiver of this department, it will be sufficient reason for his disbarment from practice; and you are authorized to refuse to further recognize any person, or agent, or attorney who shall be known to you or be proven before you to be guilty of improper and unprofessional conduct as above stated.

An attorney or agent who has been admitted to practice in any particular land district may be enrolled and authorized to practice in any other district upon filing with the register and receiver of such district a certificate of the register or receiver before whom he was admitted to practice that he is an attorney or agent in good standing.

Any unprofessional conduct on the part of an attorney or agent should be reported to the commissioner at once, together with your action in the premises.

Appeals from the action of the register and receiver in refusing to admit to practice or in refusing to further recognize an agent or attorney will lie to the commissioner and secretary, as in other appealable cases. Very respectfully,

Wm. A. J. Sparks, Commissioner.

Approved:
L. Q. C. Lamar, Secretary.

Washington, D. C., March 9, 1887.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Visit to Point of Timber Grange.

EDITORS PRESS:—Left Martinez Friday, April 15th, on the 11:20 train, and arrived at Byron in a little over an hour. Not being expected until evening, there were no greetings, save from an unexpected source—namely, from my last summer's vegetable Chinaman, who seemed not only surprised but pleased to see me. He had emigrated from Martinez to Byron, and in his broken lingo asked, "How do you do?" and kindly inquired after his old patrons. I had almost adopted the theory that all this race—those in California at least—looked alike, but this recognition explodes that notion. I am indebted to our host of the Byron hotel for finding a neighborhood buggy, whose young lady occupant kindly dropped me at the door of Sister Wills. In thus being ahead of time I visited that afternoon with Sister Wills, Brother and Sister Richardson, who are near neighbors.

Saturday forenoon Bro. Richardson took me to Salt Springs, a ride of about four miles. It was a cool, not damp morning; clouds veiled the sun without hiding the beauties of mountain and valley. Crossed the base line, looked in vain for the channel of the much-spoken-of Kellogg creek, which brings its rich grain and fruit-bearing sediment from the foothills, scatters it broadcast, and in the many years that are past has grown its living mark timber line, and yet showing no traces of the usual mad freaks of washing and leaping waters, but has rather formed a ridge or rise of ground.

Leaving the very small village that perpetuates the name of a master-poet, is like unto stepping from gardens of fruitfulness to acres of barrenness. Fine fields of rich green summer-fallow suddenly change into miles of salt and alkali regions Farm-houses are scattered along, with patches of meager growth.

These views, I am happy to say, soon terminated at the now famous Byron Salt Springs of Contra Costa, widely known as a health resort, and boasting of visitors from all parts of the State. Their records attest many wonderful cures. Here are fine buildings and unfinished extensions now in progress, which speaks well for their patronage. Bath-houses in mud, in gas-water, in hot and cold salt water, in white and black sulphur-water all under our eye. Tasting was practiced at each of these wells, the last lip-touch being given "appetizing well." The sequel was made known at Sister Richardson's 11 o'clock dinner, where it was proven that these waters—those last named at least—had not only the desired but the published effect.

After dinner the family carriage made its appearance, and the household, with three prospective Grange boys, started for Brentwood, six miles away, where an open meeting was to be held. Point of Timber Grange has its home where a point of timber many centuries ago strayed from the foothills far down into the valley, but the inroads of civilization and its accompanying woodman's axe have made the name a misnomer, except it be in the memory of the oldest inhabitant.

As everything drifts townward, it has been deemed best to move this Grange home to Brentwood, a village of fine and extensive neighborhood; here it is hoped to centralize, if not a majority, at least a respectable minority of farmers upon the platform of this organization.

Passing through this broad, beautiful valley, with fine, comfortable, well-kept homes, fields of fallow, whose rich green tints verge into those pure soil colors of highly cultivated lands, which are left in mellowing sun and the sport of climate, to store strength and richness to be given next year to the patient waiting farmer in greater percentage for his labor; here and there orchards, vineyards and fields of alfalfa vary the scene, though grain is the rule. To the right spread the San Joaquin and her landings, with "Eden Plain" in close proximity, and to the dwellers therein, no doubt, a more than idyllic reality; to the left the Marsh Grant, whose cozy canyons and fertile valleys lead up to the foothills, nay, even rest lovingly and picturesquely under old Diablo's smile.

From Byron almost to Brentwood we had ridden around sections in wholes, halves and quarters. Upon these were fixed good permanent buildings, but upon the Grant come renters' homes, suggestive ever of nomadic life, and not attractive to the home-seeker or traveler.

At Brentwood we found Bros. Steele, Coulter, Pilkinton, Sherburn, of Danville, Loucks, our District Deputy, and E. B. Smith, of Alhambra, and, only think! we listened to speeches from all that galaxy of Grange lights. If everybody was not converted to Grangeism they surely ought to be. We know good seed, though, was sown, and we hope Point of Timber Grange, in the proposed new home, will thrive and grow in keeping with the people that have cast their home-lines upon these rich plains. We can give them no better wish.

This Marsh Grant was the home place of Dr. Marsh, of pioneer fame. What were his thoughts and predictions as he stood years ago, almost alone amid Mexicans and Indians, and scanned these vast plains, then alive with elk, deer, antelope, wild horses and cattle, all in one happy family, pasturing upon wild oats tall enough to hide them from view? Did he with prophetic eye see this wilderness give way to unparalleled cultivation, and the steam horse of the East brought here with his metallic neighs to draw tons upon tons of the husbandman's gains to the water-front, there to whiten with sails waters that had hardly been furrowed since Sir Francis Drake entered those pacific portals? Did he see in his go-ahead Yankee dreams these same pacific waters open to the commerce of the great world with a Golden Gate?

This Grange stands alone in this end of the county, but we believe that the time is not far distant when neighboring ones must grow and thrive, and we conjure her to hope and persevere, ever mindful of the sympathy of those sister Granges of the county that are little nearer the setting sun.

Contra Costa Granges send greeting to every Grange in the State, bidding them join us in a basket picnic on the 7th day of May at Danville, San Ramon valley. Our picnic of last year was a grand success, despite the fact that one of our hardest spring rains showered her gifts of dampness upon us. Our county is now in her spring glory, and San Ramon opens wide her hospitable doors, and even Monte Diablo will doff his cloud-cap and bid you all welcome!

MARIA B. LANDER.

Martinez, April 24th.

Grange Picnics.

In regard to the barbecue, picnic and ball to come off at Clements, Friday, May 6th, under the auspices of Washington Grange, a correspondent of the Stockton *Independent* says: "The Patrons of Husbandry are noted for their generous hospitality, which is indeed phenomenal, and the fact of their having the celebration in hand is an assurance of its entire success. Excursion trains on the S. J. & S. N. R. R. will connect with all trains on the Southern Pacific. Parties desiring to attend the ball may leave Stockton on the 8:05 o'clock evening train, arriving at Clements at 9 o'clock and return at 6:04, morning of the 7th. Round trip tickets from Lodi to Clements will be 50 cents." W. M., Johnston and W. L., Flint are expected to speak on the occasion. The Grange meets at 9 A. M. Exercises to commence at 10 A. M. A cordial invitation is extended to all who feel inclined to come. Those who do not care to bring their baskets can obtain a barbecue dinner for 25 cents.

As to the Danville picnic, Saturday, May 7th, visitors from Sacramento way are advised to take the early train to Benicia, and cross the ferry to Martinez. Those who come by the Stockton route should take the early morning train. Friends from S. F. would do well to take the cars for Martinez at 3 P. M. Friday, as the morning train does not reach Martinez till 10 A. M, and it is a drive of 17 miles to Danville. Exercises are to commence at 10 o'clock. Bro. Blackwood, of Haywards, will preside, and Bro. Chas. Wood make the speech of welcome. As Dr. Stebbins has to get back to S. F. that same evening, he will deliver his address between 11 and 12 o'clock.

All who mean to attend are requested to notify G. P. Loucks, Pacheco, by postal card, some days in advance, that he may provide the requisite vehicles to meet incoming trains.

Sacramento Grange.

EDITORS PRESS:—The program our last Literary Day was as follows: Remarks by chairman, Wm. Sims; recitation (Kentucky Belle), Frankie Stevens; reading, Alice Greenlaw; essay, Chas. Mack; reading, Hattie Jones; recitation, Katie Aiken; Matron's offering, Ida Flint; song, Lulu Rich; instrumental solo, Frankie Stevens.

Great improvement is noted each Literary Day in all who fill their parts. The essays are full of thought and well delivered; the recitations given with elocutionary power; readings well selected and spoken with gifted tongue; songs and solos rendered well, both in voice and action. Great credit must be given to our young Grangers, and they should be encouraged at every step.

The Grange passed a resolution to initiate every fourth Saturday of the month. In that way more time can be devoted to business and Good of the Order.

A delegation of this Grange went down to Elk Grove at their feast, last Saturday. Seventy-five or more were present. A good time, as usual, was indulged by all.

Grangers' picnic will come off the fifth of May. A lively time is anticipated, as the whole country turns out. P. OF H.

Sacramento, April 25th.

A PART of Bro. Whitehead's missionary-work is the putting forth of various tracts and leaflets, calculated to secure farmers' attention and awaken interest in the Grange, inform them with its spirit, and move them to take part in the organization.

"ARCADIAN DUTIES," in the RURAL of week before last, was one of the best and most original of Grange contributions. Bro. Mackie should write as often as practicable.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

ONE of the great city daily papers tells the world that "The Hon. D. Wyatt Aiken, of S. C., is dead. Five times elected to Congress, he was one of the foremost scientific farmers of his State, and was probably better known as an advanced agriculturist than as a politician." What higher words of praise could be given the man and Patron, who ever placed agriculture *in the front?* From the earliest years of the Grange he was one of its hardest workers and ablest advocates, because it was designed to bring farmers to the front. He, above and beyond all others, did bring agriculture to the front in Congress. Often battling alone, with voice and vote, he was ever advocating the cause of those who had few friends to speak for them. Not in South Carolina alone was he "better known as an advanced agriculturist than as a politician." Not a State in our Union but recognized his advanced position, and hundreds of thousands sincerely mourn his departure. He should have a monument in Washington as the typical "advanced" farmer Congressman.

"GOD buries His workmen, but the work goes on." The work so ably assisted by D. Wyatt Aiken still goes forward. Let a few of his earnest words still continue their mission of good: "Is it presumption to suggest that the world has never seen a better educator than the Grange? It takes care of its own, and makes them better men and better women, and wiser men and wiser women. Thus it will be seen that the Grange is a family where the father's manhood, the mother's devotion, the brother's affection and the sister's love are so cultivated and developed that they reach out beyond the purview of the family circle, and embrace with fraternal kindness every member of the Order, practically obeying the injunction of our Savior when He said, 'The second commandment is like unto it: Thou shalt love thy neighbor as thyself.' This is the fellowship to be found in the Grange, and it is the fellowship of the noblest character. Twenty-nine days in the month social differences, moral convictions or political prejudices may estrange Patrons of Husbandry; but when on the 30th day they meet on a common level in the Grange, all these alienating features are dissipated. Is it any wonder, then, that farmers are attracted to the Order? Nay, verily, the greater wonder is that every farmer in the Union is not an active co-laborer with those of us who are desirous to so impress the advantages of the Grange upon the agricultural minds of the country that it, as an organization, may never be defaced by neglect, injured by prejudice, nor destroyed by ignorance; but may go on prospering and to prosper until it shall merit the fulfillment of its own selected motto, 'Esto Perpetua.'"

THIS people will never submit to being enslaved by a small minority, whose only claim to authority is power obtained by ill-gotten wealth and bribery, but as the laws now are, such is the tendency. A few men wield a power that would put to the blush the potentates of Europe, and unless a change is made anarchy and ruin will be the result, and future generations may view the ruins of this civilization, even as we view the ruins of the mound-builders. This is no time for child's play. If we are worthy of this grand heritage to which we have fallen heirs, we ought to have manliness enough to perpetuate and hand it down unimpaired to our descendants.—*E. A. Giller, Master Illinois State Grange.*

IN this organization of the farmers rest the hopes of all true friends of good government, of republican institutions, of the true philanthropist and the honest American statesman.

A CHICAGO dealer put a quart of water into a gallon of milk, and sold it for five quarts of milk. He was arrested and fined $10. A jeweler alloyed his gold one-half, then sold his goods for pure, and was sent to prison. A half-dozen railroad men issued stock to the amount of double the cost of their roads and equipments, then taxed the public to make the water-milk and the pinchbeck gold, and every one of them was sent to the U. S. Senate.

A DEPUTY in Texas, in his report to the State Grange, says: "I have the honor to report that we have one Grange (Wheatland, No. 70) that has victory perched upon her, and failure under feet. The noble sisters, seeing that the brethren failed to appreciate the honorable cause, took hold of their Grange, elected their officers, and say that the charter shall not be surrendered. May God bless them and our noble Order."

PROGRESS.—*Four more new Granges*—one in Connecticut, two in Pennsylvania and one in Nebraska. North Carolina has reorganized four dormant Granges and several more are in process of reorganization. Wissahickon Grange, Pennsylvania, 22 new members. Lawrence Grange, N. H., 12 new members. North Haven Grange, Conn., now has 100 new members. "Just purchased 40 tons of fertilizer."

HIGHLAND GRANGE, Kansas, one month ago was dormant. Reorganized; 54 new members and other applications. "This Grange renews its allegiance to the National and State organization, with higher conceptions of duty and privileges in this country, and recharters for 99 years or during the necessity of a farmers' organization."

"WE *are* plowing and sowing and reaping all over America's land."

Equality and Rights of Woman.

EDITORS PRESS:—At a regular meeting of Woodbridge Grange, April 19, 1887, the following resolutions were unanimously adopted:

WHEREAS, The position attained by a people in the scale of civilization is indicated by the rights conceded to women; and

Whereas, The elective franchise is wrongfully withheld from the women of our country; and

Whereas, The probate laws of the land are imperfect and unjust; and

Whereas, In the language of our declaration of purposes "we proclaim it among our purposes to inculcate a proper appreciation of the abilities and sphere of woman;"

Resolved, By Woodbridge Grange, No. 84, that woman is mentally the equal of man, and to extend to her every right and privilege of citizenship would tend to promote every material interest of the country.

Resolved, That Woodbridge Grange heartily indorses the sentiment—"taxation without representation is tyranny," and pledges its influence to secure to woman the full privilege of the ballot.

Resolved, That it is the sense of Woodbridge Grange that our Legislature be urged to enact laws legalizing the right of the widow to succeed her husband in their community business, and to be the sole guardian of her children.

MRS. E. J. MCINTOSH, Sec.

SONOMA POMONA GRANGE.—The Santa Rosa *Democrat* reports as most successful the quarterly meeting of the Pomona Grange held in that city on the 20th All the officers were present and W. M., G. N. Whitaker presided. Steps were taken toward perfecting the arrangements for receiving and entertaining the State Grange next October. A committee on literary entertainment and one on general arrangements were appointed and will be ready to report at the next meeting. Between 200 and 300 delegates are expected to be present at the meeting of the State Grange. The committee on Pomona Grange's exhibit at the coming fair will hold a meeting to-day—April 30th. The Harvest Feast, prepared by the ladies of the Grange, was participated in by at least 100 members.

TURLOCK GRANGE will deck the graves of its departed members with flowers, Saturday, May 7th.

The Gridley Fund Picnic.

The weather was all that could be asked, the 23d, for the joint picnic of the Pioneers, Grangers, Grand Army and Woman's Relief Corps at Good Water grove. The ladies had a tent near the pavilion, and at its entrance the original Gridley sack of flour was on exhibition. Members of the Relief Corps took turns in selling miniature sacks of flour as mementoes. Granddaughters of veterans tripped about the grove selling buttonhole bouquets.

At one o'clock, after music by the Sixth Infantry band, Judge Milner called the assembly to order and briefly told the story of Gridley and his famous sack of flour. He then introduced Hon. James A. Louttit, who delivered an eloquent oration. Toward the close he said of Ruel Colt Gridley:

"Although he never wore the blue, his devotion to the country was as deep and as fervent as that of those who marched at the tap of the drum or awoke at the call of the sentry. To-day we do the homage to his name that we have long neglected. His life was an example that we ought to impress upon our children. He left his home, taking what little money he had with him, and traveled from place to place, raising money for the Sanitary Commission, so that the boys in blue might have some of the luxuries of life and some of its comforts in the dark hour of death. It is a shame that the debt we owe him has never been paid; all should assist now in doing what ought to have been done long ago. Gridley needs no monument to perpetuate his memory; brass is not bright enough nor marble white enough to do justice to such a man. By placing a monument over him you do not increase his honor, but you honor yourselves."

Agricultural Districts.

The *Record-Union* gives the following digest:

The Legislature in 1880 made Agricultural Districts of the various counties of the State. Since then subsequent legislation has made so many changes that it is hard to tell what districts some of the counties are in. Merced, the way the matter now stands, is in two districts, and San Diego has been legislated out altogether. The districts as constituted at present are as follows:

1. Alameda, Contra Costa and San Francisco.
2. San Joaquin, Stanislaus, Merced and Tuolumne.
3. Butte, Colusa and Tehama.
4. Sonoma and Marin.
5. Santa Clara and San Mateo.
6. Los Angeles, San Bernardino and Ventura.
7. Monterey and San Benito.
8. El Dorado.
9. Humboldt and Del Norte.
10. Siskiyou, Trinity and Shasta.
11. Plumas, Lassen, Modoc and Sierra.
12. Mendocino and Lake.
13. Sacramento, Yolo, Yuba and Sutter.
14. Santa Cruz.
15. Tulare and Kern.
16. San Luis Obispo.
17. Nevada and Placer.
18. Alpine, Inyo and Mono.
19. Santa Barbara.
21. Merced, Mariposa and Fresno.
25. Solano and Napa.
26. Amador and Calaveras.

AM I TRUE TO MY DUTY AS A CITIZEN?—Referring to the light vote at the late election, and the negligence of thinking people about casting their votes, the *Bee* declares: We begin to believe that the intellectual American voter is an imaginary being. He hies him to the polls by legions when the only question at stake is as to who shall control the offices; and he remains away numerously when great principles are before the people—principles involving much in which he should be judicially, and some in which he certainly is pecuniarily, interested.

Agricultural Notes.

CALIFORNIA.

Alameda.

Osier Willow.—Ezra Whittaker in Livermore *Herald*, April 21: Some two years ago, Prof. J. D. Smith advocated the cultivation of the osier or basket willow in Livermore valley. Whatever reasons he then urged are equally strong now. It is already grown here to some extent—to what extent I am not fully informed; this much I know: There is some grown on the Bernard vineyard. Mr. Wegener has been cultivating it for the last couple of years and I believe has some of the stock for sale. Prof. Smith also grows some in his Pleasanton nursery. Prof. Smith, Dr. Bernard and others advocated the osier as a substitute for twine in tying vines, but this is only one of the many uses to which it can be put.

Butte.

Thriving Fig Trees.—Oroville *Register:* It would not have taken many of the magnificent fig leaves in this locality for the first toilet mentioned in the Bible. We plucked two from a tree in the yard of R. DeLancie yesterday, and they measured 11x14 inches. Two figs that we measured were each six inches in circumference. How is that for a green fig before the 20th of April?

Colusa.

Grain Doing Finely.—*Record-Union:* At Grand island, and vicinity, the growth of grain is reported as wonderfully fine. On the island barley is breast high, headed out nicely, and growing so compactly and evenly that agriculturists view it with great admiration. On Chas. F. Reed's ranch the appearance of the grain is equally good, and there will be an immense yield unless something unforeseen occurs.

The First Artesian Well.—Colusa *Sun*, April 23: Water has been struck on N. D. Rideout's farm, near Norman, at a depth of over 1000 feet, that flows about one foot above the ground. Mr. Rideout is going down further, with a hope of striking a stronger stream.

The Glenn Ranch.—Marysville *Appeal:* The Glenn ranch comprises 52,000 acres, of which 23,000 are in grain this season. Of the 23,000 acres, 14,000 were summer-fallowed and 9000 winter-sown. F. C. Lusk, who has charge, is confident that the product this year will be 25 bushels to the acre. There are at present engaged in summer-fallowing 10,000 acres, 80 8-mule teams, making 640 head of mules at work. This is but little more than one-half of the work animals on the ranch. In 1880 the Glenn ranch produced 1,235,000 bushels of grain, of which 100,000 sacks were barley and the remainder wheat. During the harvest season of that year Glenn is reported to have said to his men: "Boys, I want you to hurry all you can. I am paying $20 an hour for interest." It is probable that the ranch will be kept intact for years to come. The heirs of the estate are said to be disposed to hold it undivided.

Irrigation Matters.—Maxwell *Argus*, April 21: The irrigation meeting last Saturday was better attended than before, and greater interest was manifested. It resulted in definite action, a committee of five being appointed to supervise all preliminary arrangements, including the circulation of petitions, procuring of bonds, and securing the services of an engineer to make the boundaries, give an estimate of the cost of construction, repairs, etc. The committee appointed by Chairman Sutton were Henry Eakle, P. R. Garnett, G. F. Packer, G. B. Harden and W. P. Harrington. It is a good, well-selected working committee.

Contra Costa.

Wheat that is Wheat.—The Antioch *Ledger* office has on exhibition a fair average sample of 180 acres of summer-fallow on Jake Bonslett's place on Los Medanos. It is 4½ feet in hight, strong in growth, dark green in color, and has heads from three to four inches in length. A portion of the wheat in the fields is a foot higher. Three years ago, when the crop was short and while many of his compatriots looked as if they were under contract as undertaker's apprentices, Mr. Bonslett's demeanor was unchanged. His farming had been conducted on business principles and resulted in giving him a return of 3000 sacks of superior wheat. Summer-fallow will do it every time.

Lake.

Vexed by "Varmints."—*Avalanche*, April 21: Wm. Storms, who lives up in the Rincon valley on Kelsey creek, reports that his crop looks well, but says he is much troubled with coyotes, panthers and wildcats, which are entirely too fond of mutton for his interest.

Los Angeles.

Honey Outlook.—Orange *Tribune*, April 23: N. D. Harwood was down from the canyon this week. He says the prospects are better for the bee-men this season than they have been for years. The honey crop will be large, and young bees are plenty. The late rains have been of vast service to honey-producers, and this summer will be a grand one for bee-feed. The Santiago canyon country furnishes some magnificent honey, and the foothills all along the San Diego are not much behind.

Pecans that Bear.—J. W. Potts in Los Angeles *Express:* There is a pecan tree 2½ miles from your office that I planted seven years ago, when it was about an inch in diameter, that is now, by actual measurement, 18 inches in circumference and more than 20 feet high. There are also older trees that I planted the nuts for about 15 years ago, that are bearing nuts and have been for five years. The trees can be seen in El Monte at Mr. Gibson's place, at J. B. Rearles' in Los Nietos, at Captain C. E. Thom's and many other places. The pecan is a thrifty grower and bears at ten years from the seed. So does the old States black walnut. Both of these old forest trees are thrifty growers here and bear nuts at the same age as the English walnut.

Modoc.

Galloway and Cleveland Bay.—*Sagebrush Stockman*, April 20: A. J. Jackson, of Reynolds & Jackson, stockmen of Modoc county, Cal., arrived at Reno Monday, on his way East, and will visit Denver, Kansas City and other points, in search of thoroughbred cattle with which to improve his stock. The Galloways having made quite a record for themselves in Modoc county the past winter, his preference inclines that way, and the probabilities are that he will invest quite heavily in that breed. Reynolds & Jackson are also engaged in raising horses, and a Cleveland Bay stallion, "the coming horse of the West," will also be secured.

Napa.

Cut-Worms.—Howell Mountain Cor. St. Helena *Star:* Vineyard work is well advanced, but many vineyards are being seriously damaged by cut-worms, which are more numerous than heretofore. They secrete themselves during the day and come out at night, cutting out the young buds, and, in some cases, killing the vine. If not hunted and killed, they will seriously shorten the crop. We hear of one vineyard, on the northern slope of the mountain, entirely ruined for this season by this persistent worm.

Nevada.

Irrigation Enterprise.—Grass Valley *Union*, April 21: John Hastings, who contracted for a portion of the ditch belonging to the Excelsior Co., from Newtown toward Pleasant Valley, has about completed the work. There is yet a section to be put under contract before the entire line, which will be 16½ miles, is covered. By means of this ditch irrigation facilities will be given to a considerable area of territory north of Deer creek along the divide between that stream and the slope of the Yuba, which will enable farmers to cultivate alfalfa fields, orchards and vineyards. The ditch will carry 400 inches of water.

Placer.

Marauder Captured.—Cor. *Record-Union*, April 23: One day last week C. F. Withrow, living at Cape Horn, near Colfax, saw a large eagle fly down into a ravine, where he had noticed a flock of goats contentedly feeding. Presently a sharp bleat from a kid was heard, and the flock of goats came running from the place badly frightened. Taking his gun and going to the top of the ridge overlooking the ravine, Mr. W. saw the eagle perched on the dead kid and proceeding to take a meal. Before he could fly he received a load of No. 5 shot, which set him to turning somersaults. He was now an easy prey, and by use of a club was soon dispatched. The bird measured six feet seven inches from tip to tip of wings, and two feet nine inches from tip of beak to tip of tail. There is another in the neighborhood.

Plumas.

Editors Press:—The storm king seemed to exhaust his resources with us in the month of February. The severe storm of wind and snow on the 24th of that month was followed by some unusually cold weather. But the days soon became pleasant, and the four feet of snow sank rapidly into the ground, going off in the best possible way. The roads, which were for a time impassable, soon became good. Every one is very busy, and seeding is going on rapidly. The ground is becoming unusually dry for this time of year. There was plenty of hay in the valley, so the stock have come through the winter nicely, and dairying will be carried on as usual, with the hope that the passage of the oleomargarine bill will give us a better price for our butter. The price of beef has risen from 5½ cents in March to 9½ at present, the reason given being the failure of drovers to make the contemplated supplies. The work on the Sierra Valley & Mohawk R. R. was pushed rapidly forward until the storm of February 3d suspended operations, which it is supposed will soon be resumed. There is nearly 30 miles of the road-bed built, and some 10 miles of track laid.—M. P. A., *Beckwith*.

Sacramento.

Sales of Nursery Stock.—*Record-Union:* Nurserymen who have been maintaining yards in this city for the sale of young trees and bushes for several months past, have closed out for the season. The sale of all kinds of trees has been very large, and the number of orange trees disposed of indicates that a great many people are determined to test the capabilities of the "citrus belt."

San Bernardino.

Citrus Shipments.—*Valley Echo:* The total shipments of oranges and lemons from Riverside station for the season of 1886–7 to April 21st amount to 57,190 boxes; from Arlington, 12,000 boxes; total, 69,190 boxes—equal to 233 carloads.

San Benito.

Cleveland Bays.—Hollister *Advance*, April 22: A parade of Cleveland Bay colts took place in town on Saturday afternoon, led by Colwell's fine stallion Rainbow. Among the family were a pair of colts belonging to Harve Moore, two of Henry Kent's, two of Horace Gould's, one of T. B. Hubbard's, and one of Thos. Johnson's. All the youthful specimens of horseflesh held their heads proudly erect, and presented a good view of bone and muscle.

San Diego.

Hay Prospects.—National City *Record*, April 21: Early sown grain in this vicinity is heading short—only a fair crop of hay, at most, can be expected; hence we predict that hay will bring a remunerative price for a year to come, especially as an amount of work is in progress throughout the country which requires horses in great numbers to accomplish.

San Joaquin.

A Huge Oak Log.—Stockton *Independent*, April 24: A mammoth oak tree, on the ranch of W. G. Phelps, about two miles south of the racetrack, was an old landmark, familiar to the residents of this section since 1853. Although the trunk has been stripped of its bark and lying on the ground for a number of years, it is still solid and sound. This specimen of San Joaquin county oak trees was secured by John Gambetta, who had it hauled into town at great expense and trouble, by a team of 20 mules and half a dozen mule-drivers. The log, measuring 20 feet in length and 10 feet in diameter, and weighing 37 tons, was placed on the wheels and bed of a house-moving apparatus, and after a hard pull and a strong pull, was finally landed on Hunter-street Square yesterday afternoon. Hundreds of people visited the square during the day and evening and paid their respects to the old oak log. Mr. Gambetta had the curiosity brought into town and placed on exhibition as an advertisement of the timber resources of the county.

Santa Clara.

Silkworms.—San Jose *Mercury:* At the Home Agency of the Board of Trade has been placed a new display which is proving quite attractive. It consists of a large number of young silkworms, on mulberry leaves spread on a table in the rear office. The insects are growing rapidly and quite active. The exhibit is made by the Pacific Silk Factory.

Shasta.

Home-Makers in Earnest.—Cottonwood *Index*, April 21: One year ago this month Mat Ringle and family arrived in Cottonwood from Michigan. They at once secured 160 acres of unimproved brush land in the foothills about 15 miles west of here and in the "thermal belt." Mr. Ringle now has 40 acres fenced in with a strong stock-proof fence; 25 acres cleared, 6 acres in oats and 14 acres in wheat, all of which has a good healthy look and will make a good crop. He also has two acres fenced with pickets for garden, and everything imaginable planted and growing there. He has 800 grape-cuttings, which are growing nicely and will be well rooted for next season. He has a good, comfortable house and barn. Mr. Ringle has accomplished more in the last 12 months than many others have in 12 years. It is easy to see why some people get ahead while others cry hard times and "damn the country with faint praise."

Solano.

Editors Press:—The weather for a few days has been very warm, with north wind. Mr. Bassford shipped some cherries yesterday. The cherry crop will not be heavy; while trees of some varieties are full, others have none. Black Tartarians are very scarce. Apricot trees are generally full, though some that were full last season have but few this year. Many are thinning now. Fruit should be thinned about the time the pit is formed. The last rains wet the ground so that all have been able to get their orchards and vineyards in the finest order. There is promise of the largest crop of peaches we have ever had. Many trees will need from one-third to one-half of the fruit thinned off. Several new driers are being put up around here, and others are talked of. May-day picnics will be plenty, both on Saturday and Monday.—G., *Vacaville, April 25th.*

Sonoma.

Olives Bearing Early.—*Democrat*, April 23: It is often stated that the olive tree will not bear until in its seventh or eighth year. Captain Guy E. Grosse thinks that on his mountain ranch may be found proof satisfactory that such is not the case. Out of his 500 olive trees, planted four years ago, 461 are in full bloom and promise a good yield. Further and successful refutation of the statement concerning the maturing age of the olive may be found in this city. On A. B. Ware's premises is an olive tree four and one-half years old, which bore a good crop last year.

The Butter Crop.—Editors Press: The output for butter will not be as large as last season. Short feed through the winter and an unusual amount of cold winds kept the grass back until late. The last rain followed by warm weather has done some good and will keep the grass longer.—E. H. Cheney, *Bodega*.

Tehama.

Poland China.—Red Bluff *Sentinel*, April 23: Last Wednesday B. A. Bell received per Wells, Fargo & Co. a fine thoroughbred Poland China pig from Park H. Hammond, Oneida, Knox county, Ill., one of the popular raisers of pure blood hogs in the United States. "Markham," the stock-book name of the pig, will not be a year old until the 18th inst., and he weighs nearly 400 pounds. He has taken two medals, one at the Illinois State Fair and one at the Rockford County Fair. "Markham" is a handsome animal, if it is possible for a pig to be handsome. Mr. Bell took him out to the Gallatin ranch.

Tulare.

Hare-Hunting Extraordinary.—Tulare *Register*, April 22: They had a big rabbit hunt out at E. W. Kay's the first of the week. A quarter section of land was surrounded by the hunters, and the result of the round-up was the slaughter of 590 jacks. A header-bed, loaded with 250 of the deceased depredators, arrived in Tulare, Monday.

Yolo.

Floral "Cold Storage."—Woodland *Democrat:* A novelty in the shape of a bouquet of flowers frozen in a solid chunk of ice is displayed in front of the market of A. Mossmayer. The bouquet was hung by a string in one of the boxes for making ice at Harnish's factory, and when the water froze the bouquet was in the middle, looking as natural as life. It attracts much attention.

Yuba.

A Solid Calf.—Marysville *Appeal:* O. H. Sawtelle has a pet in the shape of a part Holstein calf, which he has taken great pleasure in showing to visitors. Before sending the animal out in the country to pasture, it was weighed and tipped the beam at 274 lbs., much to the surprise of those who saw it.

Holding up Hopvines.—Wheatland *Graphic:* Heretofore growers have used small willow and cottonwood trees for the purpose of training their hopvines. These poles had to be replaced so often that they were the cause of considerable expense. The gentlemen interested in hop-growing have replaced these poles with pine timber, set about 100 feet apart and connected with strong wire, from which strings are dropped to the ground. Dr. Durst has set out nearly 100 acres of these timber poles. Before the poles are placed they are boiled in tar to the depth of four feet to protect them from decay. The first cost of these is, of course, much greater than that of the old kind, but they will last so much longer that there will be a considerable saving in the end. The old hop poles last only three seasons at the most.

NEVADA.

Feed and Stock.—*Stockman*, April 20: F. C. Dickinson, of Manning & Dickinson, came in from Pyramid, Saturday, and reports everything favorable in his section, provided rain falls the present month. Already grass is springing up all over the country, but copious showers are needed to insure a good supply. Unless it does rain, stock will fare badly this summer, as they are spring-poor—the past winter having proved quite severe, although stock came through in much better condition than could have been expected.

The Late William Ashburner.

Prof. Wm. Ashburner, a well-known man on this coast, died at his residence in this city on Tuesday. He was formerly on the State Geological Survey, with Prof. Whitney, and has long been identified with mining interests. He was a mining engineer by profession, though of late years he has done little in this direction. He was Honorary Professor of Mining at the State University, and one of the Regents of the institution. Prof. Ashburner was also a trustee of the Leland Stanford Jr. University. For several years he was president of the Board of Trustees of the California Academy of Sciences, and has served one or two terms as president of the San Francisco Microscopical Society. He was also a member of the Historical Society, the Technical Society of the Pacific Coast and the Geographical Society.

Prof. Ashburner took a very active interest in the affairs of the State University, and will be greatly missed in the Board of Regents. He was a man held in high esteem for his talents and his social qualities. He was quite active in all of the societies with which he became associated. Of a genial disposition, he made friends in all directions, and his loss is deeply regretted by a large circle.

The Late Dr. Kellogg.

At the last meeting of the Academy o Sciences, Dr. Behr read a brief memorial of the late Dr. Albert Kellogg, and on motion the following preamble and resolutions were read and adopted:

Wherras, Our co-worker in the field of science, Dr. Albert Kellogg, whose amiable qualities of head and heart won the friendship of all who knew him, has, by that divine and inscrutable Providence which governs all things, been removed from his late sphere of action and consigned to his last resting-place of mortal man; be it

Resolved, That it is with sincere regret that the officers and members of this Academy of Sciences have received the announcement of his death, and we do hereby desire to express our sympathy with the relatives and friends of the deceased.

Resolved, That this memorial paper and these resolutions of condolence and respect be spread in full upon the minutes of the Academy.

Finding on our desk the card of B. M. Lelong, Secretary State Board of Horticulture, leads us to infer that he has taken charge of his office and may now be found, ready for business, at No. 40 California street, San Francisco.

Some of the persons who bought land at auction at Templeton, last week, have taken their families there and are plowing for late crops.

The Stars.

[Written for the RURAL PRESS by F. H. A.]

"The stars are the apexes of what wonderful triangles."—THOREAU.

I well remember when I thought
  The stars were brilliant points of light
That the Almighty had but wrought
  To brighten up the gloom of night.

And often, in my childhood's days,
  I stood and watched, with earnest eyes,
Their silvery, scintillating rays,
  With much of curious surmise.

How high they are—how bright—how far!
  And oh, I mused, how great their number!
As they peeped out, star after star,
  They seemed like night-flowers waked from slumber.

Now when I contemplate those spheres,
  My early wonder's not outgrown;
It has increased with added years,
  And has a deeper, graver tone.

But oft a sp'rit of unrest
  Steals o'er my being when I view
Those hosts, which science does invest
  With charms my childhood never knew.

O Richter! when thou didst essay
  To paint a mortal's stellar flight,
How nobly did thy pen portray
  His feelings, and depict his plight!

Before the splendors, vast and grand,
  That ever rose, still more and more,
He prostrate fell, faint and unmanned;
  He could but tremble and adore

The Power that made the worlds of light—
  The Power that gave him sight and thought
To see and apprehend aright
  The works with which creation's fraught.

Man longs to explore the sparkling stars
  That sweep through space with splendid roll;
Their heavenly hight his quiet mars—
  Their mystery agitates his soul.

No other wish has deeper hold
  Upon his seeking mind than this:
That *some time* he will see unrolled
  The scroll of God's great Universe.

San Francisco.

The Way His Mother Did.

I cured my Jeremiah of thinking that he could cook jest as his mother did easy enough. Says I, at the breakfast-table one morning:

"Jeremiah," says I, "I biled my meat yesterday, and if you'll bring in that jug of cider-molasses that you put into the ice-house to keep cool through the summer, I'll make up my mincepies to-day."

A simple remark enough, and innocent, but who can tell what a word may bring forth?

"I wish," says the pardner of my joys, and (when he can't dodge them) of my sorrows, "I wish I could taste some of my mother's pies again. Them was pies as *was* pies."

Now, I know that if Philura Jane Jones can do one thing better than another, it is to make a mincepie, but I kep' calm outwardly.

"How was they made?" says I; "what was the ingregiences?"

"Wal," says he, "I used to watch her, an' if you'd hear to me, I believe I could tell you jest how. Hi! wasn't they good, though? I vum, I believe I could make 'em myself."

"Perhaps you'd better," says I coolly.

"I *can*," says he, "an' I declare for all tryin' to boss a woman round—I *will*."

I couldn't help but laugh to see him go to work. I got him my big check-apron and tied it on. I brought out the flour, and the lard, and the saleratus, and the salt, and the spice-drawer, and the sugar-box. Jeremiah he went out and got the cider-molasses. The meat and apples was already on the table.

"There!" says Jeremiah. "Now I'll show you something about pies."

I said nothing, but went to washing up the breakfast dishes and sweeping up.

"I don't get to baking so early as this, generally," says I. "You've got a good start."

"Oh, yes," he answered in his gayest tone, "'twon't be no time afore I have them pies all settin' in a row on the buttery shelf. Hain't you got no sour milk?"

"Why, yes," says I, "but you don't want it for mincepies!"

"Who's makin' these pies?" says he. "My mother always used to make sour-milk piecrust, and I believe it would taste good once more."

So I brought the sour milk. He dipped out about two quarts of it in my big yellow mixing dish.

"Where's the short'nin'?" says he.

"There's the lard and there's the butter here if you'd rather have it."

"My mother used lard," says he. "Where's a dish to melt it in?"

I got him a dish.

"Most folks rub their shortening into the flour," says I.

"My mother didn't," says he. "As I said before, who's makin' these pies? If you are, I'll go out and mend the fence. If *I* am—"

"I won't say another word," says I. I've had some experience in managing an opinionated pardner before.

He stirred his melted lard into his sour milk, and it rose to the top in little lumps. Then he began to stir in flour. I see he hadn't put in any saleratus, but knew him too well to venture to say so. Jeremiah Jones sometimes needs to attend the school kept by experience.

He stirred and stirred and stirred. When he finally got it thick enough, there was batter enough, such as it was, to make several dozen pies.

"These pies are goin' to be so good," says he, "we'll make up a lot of 'em. Where's the pie plates?"

I brought them to him all buttered, and he began to roll out his crust. By this time it was so thick that it could scarcely be induced to roll out at all, but he worked nobly. When he got his first piece rolled down to about an inch in thickness, he stopped and looked at it.

"I like a good thick crust, myself," says he. "An inch thick ain't too much for a real juicy inside."

"No," I answered, comforting myself with the thought that his crust wouldn't rise up to call him blessed, the way most sour-milk crusts do. By the time he had rolled out four under-crusts, and used perhaps one-eighth of his batter, he laid down his rolling-pin.

"Shan't I chop your meat for you?" says I.

"No, sir-e-e!" says he. "Who's makin' these pies? I wish't you hadn't chopped the apple. I've got an oven-full rolled out, and now I'll make the inside. Where's the choppin'-tray?"

"Did your mother have somebody to hand things, or did she get them herself?" says I good-naturedly, handing him the tray and the choppin'-knife.

He put all his meat, some four or five pounds, into the tray at once, and began to chop. He chopped, and he chopped, and he chopped, and still great masses of whole meat kept coming to the surface. After three-quarters of an hour of hard work he got it so there wasn't any pieces more than one and a half inches square and two inches thick, though there was plenty that big. Then he went for the molasses jug.

"You ain't going to call that fine enough for the meat?" says I.

"Course it's fine enough," said he. "Takes the life all out of mincemeat or hash or anything, to chop it too fine."

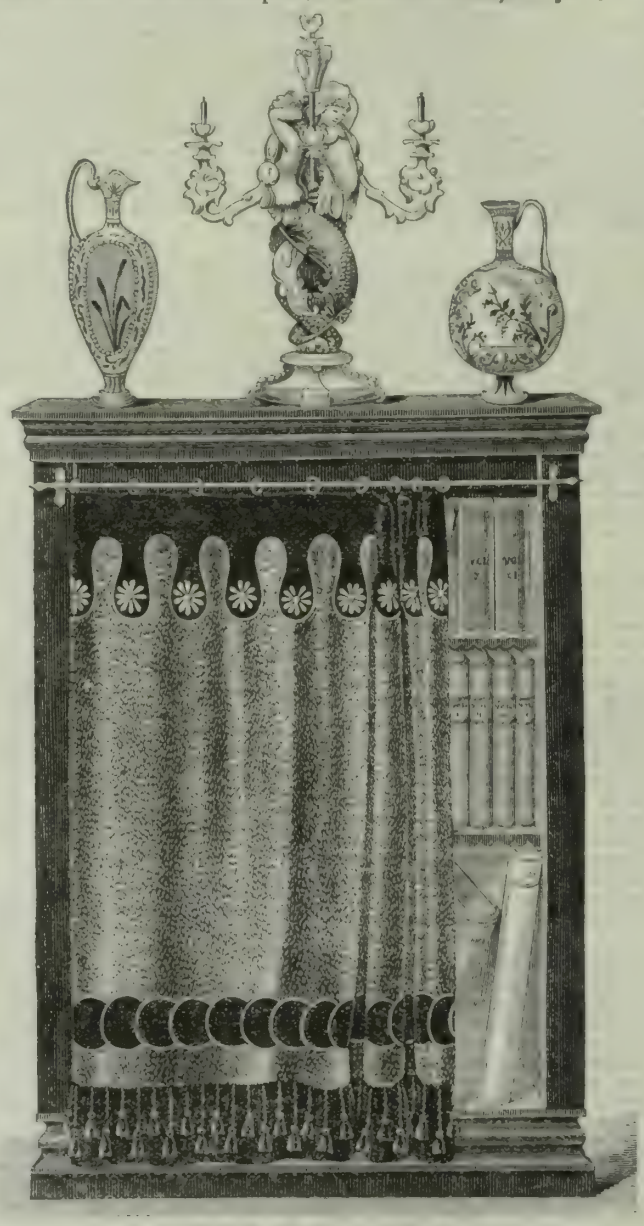
"But, Jeremiah," says I, loth to see so much good meat wasted, "that won't be fit to eat. Let me take it. I'd rather chop than see the pies spoiled."

"Sp'iled!" he cried. "Who's makin' these pies, Philura?"

"I wouldn't want to swear that anybody was," says I.

"You always make your pies too sweet," he went on, measuring out sugar by the teaspoonful. "My mother never used much sugar."

Then he poured in two teacupfuls of cider-molasses and a teacupful of vinegar. He liked them real tart, he said.



"Now for spices," says he. "Lemme see. She used to put in a lot of ginger, I remember." And thereupon the whole two-ounce package was emptied into the pan. "And cinnamon—ain't we got any cinnamon stick?"

"No," says I; "you say you don't like it."

"It's best for pies, I guess, but this will do;" whereupon the package of cinnamon followed the ginger. "Cloves, oh, yes! Where's the mortar 'n' pestle?" And he ground up a quarter of a pound of cloves and stirred them in. "Now, that's all but the raisins. Oh, no, there's the apple." And he shoved in the chopped apple. "Oh, yes, bread! My mother used to chop up bread and put in."

"That was when she was short of apples," I remarked.

"Who's runnin' these pies?" he repeated. "Git me some bread, will ye?".

PORTIERE FOR BOOKCASE.

I brought the bread, and he pounded some up and stirred it in.

"Now I guess it's ready," and he began to ladle it into his under-crusts.

"Ain't you going to taste of it and see whether it is right?" says I. "Your mother used to."

"That's so," says he, "and so did I, and wa'n't it good?"

He smacked his lips and tasted, but I noticed he didn't smack 'em a second time.

"You ought to set it on the fire and cook it all together," I couldn't help saying. "Why, what's the matter, Jeremiah?"

The tears was chasing each other down his hollow cheeks, and for a minute I was real scairt.

"There seems to be a leetle too much ginger," he said, blowin' his nose, "but I'll fix 'em."

Then he went to work puttin' in more stuff. A cup more of cider-molasses and a cup more of vinegar, considerable pepper, but no salt, two pounds of raisins, whole, and the contents of a bottle of paregoric, I see him put in. Then he went to the settin'-room closet and brought the bottle of brandy I keep for sickness and put about half of that into the mixture he was concocting. I looked horrified, indeed, for I *never* use it in cooking.

"Doctors say mincepies ought always to hev brandy in 'em to keep 'em from hurtin' folks," says he; "I don't begruch a leetle brandy in such good pies as these."

Then he stirred up the whole mess. My land! There was great chunks of meat and great long strings of it. And such a looking pan of mincemeat I never see!

But I said nothing as he went on and filled his pies, and proceeded to cover 'em. The crust had got so hard and stiff he could scarcely roll it out, but he finally got it down not much thicker than the under-crust. Without cutting any airholes he covered the pie, tucking in the edge where it came over, and pulling it out where it came short. Then his pies went into the oven.

He insisted on building up an awful fire, and in a few minutes the juice of his pies (his meat was floating around in an abundance of molasses and vinegar) came running out on the floor. Jeremiah bounded to the oven-door. He didn't look near so chipper as when he first began the pies.

"I wish, Philura," says he, "you'd jest see here a minute. That crust don't act well."

I should say not! The inside had riz up and was runnin' over all around, while a thick, leathery-looking substance rose up in the middle of it, burnt pretty near black.

"Who's runnin' these pies, Jeremiah?" says I. "You didn't stick your two crusts together."

"Wal, why didn't you tell me not to begin with them?" he yelled; "not twit me with it now."

But I went back to the settin'-room where I was sweeping, and left him to rastle with the pies alone.

But after awhile I looked out. I never see a more dejected-looking picture, or a more depressed man. His apron had got twisted to one side and was all covered with flour. Great dabs of flour was on both sides of his face and his whiskers was jest dredged. The tears he had shed had made water-courses through the dirt and flour, and his expression, O my! words fail me. He was jest taking a pie out of the oven and settin' it on the table. He put the pan of mincemeat in a chair to make room for the next pie, and then he took that out, the liquid from it dripping all over him and the kitchen floor. And if it wasn't a queer-looking pie! The crust had crawled up in a roundish heap in the middle, and the inside was roaming about everywhere, as if seeking somebody to devour it. My pardner stood still (leaving the oven-door open) and gazed at them. Then he backed back in a sorrowful kind of way, and set right square down in his pan of mincemeat. He had had it on the stove, and it was b'iling hot, and he yelled according, jumping an' tearing around the room like mad. I rushed out with some dry pants and helped him on with 'em. The first thing he did afterward was to take them two pies and march into the shed. Here he deposited 'em in the swill-barrel. Next he went in and took the two out of the oven and carried them to the same appropriate grave.

"Now," says he, recklessly, "you may finish the pies, Philura, and I'll mend the fence."

"Who's making these pies, Jeremiah?" I couldn't help saying.

"Throw that in my face, will ye?" he muttered, in very subdued accents, as he went out and got his axe.

But I never grudged them poor pies, for I never heard any more about the way his mother used to do things.—*Helen M. Winslow.*

Design for Portiere.

Many of our readers, no doubt, like to employ their spare moments in making various articles for home adornment, and in so doing they successfully invade the spheres of the carpenter, the cabinet-maker, the upholsterer, etc. Many times a really handsome article of furniture can be made of odd materials or of material purchased at little cost. Our engraving shows how a very neat bookcase can be made with a few hours at the bench, supplemented by the flying of the needle. Perhaps the design may be of use to some of our readers either as a model or as suggestive of other designs.

THE GENTLE MAN.—But the true gentleman nowhere shows his superiority to other men more strikingly than his behavior to those who have given him cause for offense. There is solid truth in the quaint old Scotch proverb, "It's aye gude to be ceevil, as the auld wife said when she beckit to the deevil." In society, to treat with marked coldness those whom we do not like is disrespectful to all present. Bishop Pearce reminds us, though the observation is not original with him, that "in Christ's parable of the marriage feast, though the fact was plain respecting him who had not on a wedding garment, yet the king addressed him with the mild appellation of friend, in the sense of one to whom good-will and civility were due; and that Abraham called the rich man even when in the place of torment by the name of son."—*Prof. Carey.*

"OLD CLOTHES" or "Hard Times" parties have been quite popular of late in some portions of the State. All who attend are expected to wear their seediest and most antiquated garments; but any one known to have borrowed the raiment of a tramp for the occasion would be promptly ruled out.

THE Washington *Critic* says: Now that strawberries have appeared in the markets, the monument is not the highest thing in town.

My Lady's Cheeks.

[Written for the RURAL PRESS by DAGMAR MARIAGER.]

My lady-love has charming cheeks,
And like two jealous sisters,
When one I kiss, the other seeks
The tropics' warm registers.
Then when I change from left to right,
I take the same condemning;
The left one warms for sentence quite
Severe as that of hanging.

The Blessedness of Rural Life.

EDITORS PRESS:—The rains came so opportunely that Nature could not but respond to the baptism. Tuolumne county is in its gayest dress. This Sunday morning flowers deck field, valley and hill. Cereals, fruits and every variety of crops will be abundant. When it is not raining, the sky is overcast, so that the moisture is retained and growth continues.

How thankful man should be for plenty and peace! As a nation we are at peace; as individuals, few possess the gem, morally, financially, or spiritually. Ailments afflict the human family from violations of the laws of health. Premature death or living misery is the consequence. The husbandman has it in his power to attain peace and plenty, health and happiness, far above those who trade, gamble, and deal in or use man's worst enemy, alcohol.

Peace is written all over a well-appointed Granger's domain. The substantial dwelling; the barns and all home conveniences; the live-stock cared for or roaming amid the clover; the chickens proud and crowing; the youngsters going to and returning from school; the kindly greeting from well-fed Rover; the matron, "fair and forty," smiling upon a scene which angels delight to gaze upon; the Granger himself in his road cart, overseeing his large and valuable possessions, so that nothing goes to waste, nor man, baby nor beast suffer unnecessarily.

Almost anywhere in our Golden State you will find such homes, enriched by domestic love and genuine peace and contentment. Perhaps many of these well-to-do Grangers do not appreciate their enviable condition. They read of sudden fortunes made by mercantile adventure and speculation. But they know not the many wrecks which occur in speculative life, or they would humbly thank God for their independent and honorable calling.

A producer of bread is engaged in the highest and most sacred occupation man may follow. What would the world be without the Granger, with all his modern appliances for producing cheap food? Other men may speculate and grow rich, but it is upon the productions of others and not by their own labor. The orange groves, dotting our fair Eden, have been nursed into life and usefulness by patient industry and faith in well-directed effort. Our cities are not established by money-changers, but by brain and muscle, energy and grit.

We never pass by a well-appointed rural home without appreciating all the belongings internally, as well as the outward appearances—a happy family, a warm welcome to friends, a good word and substantial encouragement to the poor and needy; in fact, a miniature heaven where the mother-angel presides, supported by the strong arm and loyal heart of the president, controller, banker and treasurer all combined in one, ably assisted by his better-half. There are exceptions to this rule, but it is soon manifest in outward decay and wreck and in mortgages beyond the power of redemption. But my space is more than occupied with these reflections, many of them too true.

JOHN TAYLOR.

Mount Pleasant, April 17, 1887.

Problems—Not Algebraic.

A NEGRO MINSTREL COMPANY adds one new jest to its repertoire every 300 years. How long will it take this company to get an entirely new repertoire?

THE average age of a jest when it is finally shelved is 9500 years. How soon may we expect to see the last of the mother-in-law pleasantry? of allusions to the exorbitant charges of the plumber?

A. SPENDS 20 minutes in trying to condense a 16-word telegraphic message into 10 words in order to save 12 cents. He finally succeeds. During the 20 minutes thus occupied he might have made $3 at his business. State his profits by the operation.

MRS. B.'S new dress cost $129.50. Mr. B.'s salary is $80 per month. State the probable actual cost of Mr. B.'s noonday luncheon for the next six weeks.

FOR preparing a prescription, the principal ingredient of which is aqua pura, and which costs him four cents, my druggist charges me 55 cents. What would he charge if the drugs were worth 9 cents? 11 cents? 80 cents? $4.50?

THE average clergyman earns $750 per annum; the average faro-sharp clears $8500 per year. How much is it worth to be virtuous nowadays?

DURING a period of three years I expend $211 for lottery tickets. I finally draw a prize of $75. To celebrate the event I give a little champagne supper costing $60. State my profits by the transactions detailed.—*Tid-Bits.*

YOUNG FOLKS' COLUMN.

The Little Window-Washer.

[Written for the RURAL PRESS by I. H.]

It was a cold, blustering afternoon in the month of March. The wind came whistling round the corner and fairly twisted off the shawl of a girl who stood there, looking up and down the street, as if uncertain where to go or what to do. She held in her hand a small basket, carefully covered with a cloth, but as she made a snatch at the flying shawl it fell from her grasp, and out on the sidewalk rolled the entire contents—papers of pins and needles, spools of thread and cards of buttons; a poor little supply, and all of an inferior quality. With an exclamation of distress, she stooped to gather them up, wiped off any specks of dust, and replaced them in her basket. As she rose and looked around once more, a party of schoolgirls approached her—well-dressed, comfortable-looking girls—swinging their book-satchels and lunch-baskets and laughing and talking gaily as they passed. None of them noticed the forlorn little figure, but the child looked after them with longing eyes. Why was she so different? The contrast added to her misery.

Presently, as she watched them, they separated and scattered in different directions, and now one alone was left in sight—the tallest of the little company—a girl with a sweet, thoughtful face and a more quiet and lady-like manner than any of the others. She, too, disappeared, going in at the door of a large candy-shop on the next square.

"Oh!" exclaimed the girl, "I wish I had spoken to her. She must have some money, or she wouldn't go in there. I'll ask her when she comes out." And with rapid steps she followed and waited outside the shop door.

Meanwhile, Julia Middleton, unconscious that any one was interested in her movements, had given her order to the woman behind the counter: "Twenty-five cents worth of those fresh caramels in the window."

Evidently she was a regular customer. The woman laughed as she turned to weigh them. "I see you keep an eye on us," she said.

"Oh, yes. Thursday is caramel day," Julia answered. "How nice they are." Then, as she laid down a half-dollar, she added: "You can give me as many more in a separate paper."

The second package was not for herself. She would take it to May Allison, who was her dearest friend, and who fully shared her taste for nice candies.

The two dainty white parcels deposited in her lunch-basket and the empty purse in her pocket, she left the shop; but she had not taken half a dozen steps when she was accosted by the child with the basket:

"Please buy a paper of pins, oh, do please buy them."

A paper of pins! Never in her life had Julia bought with her own money anything so useful and commonplace. But there was such heartfelt entreaty in the voice that she stopped.

"I can't," she said. "I am very sorry, but I haven't any money. I have just spent the last cent."

"Oh—" The child made a despairing gesture. "Why didn't I stop you before? I haven't sold a thing to-day."

"And will they beat you if you go home without any money?" Julia asked, remembering certain mournful tales she had read.

"No; my mother never beats me." The answer was prompt and a little resentful. "She let me have a dollar to buy things with because I begged her, and now I can't get it back. I've been out all day, and I can't sell nothin'." The tears that had been gathering as she spoke now overflowed, and the girl sobbed and cried bitterly.

"Don't cry," said Julia, more than half inclined to cry too. "That won't do any good. You are cold and hungry. Come home with me, and I will see what can be done."

The promise of assistance was rather indefinite, but the poor child was so disheartened that she was ready to grasp at any outstretched hand. She dried her tears and walked on beside Julia in silence.

It was not a large or a handsome house where they finally stopped, for the Middletons were by no means wealthy people. An old-fashioned cottage standing back from the street was their home.

"Come in," said Julia as she opened the gate and led the way through a pretty garden already gay with early spring flowers. "And now tell me what is your name."

"Susie Carter," said the child.

Julia took her in at the back door, which opened into a large, light kitchen where a woman stood at a table, ironing.

"O Nora! is mother gone? I quite forgot."

"Yes, she's gone, and Miss Ann isn't come yet," Nora answered, putting her iron on the stove and turning to look rather suspiciously at Susie. "Who is this?"

"She's a little girl who is going to have dinner with me, if there is any," said Julia, "and I hope there is, for we are both hungry."

Nora said nothing. She did not like beggars, but if Miss Julia chose to ask one to dine with her, it was her own affair. She opened the oven door and took out part of a meat pie warmed over, some baked potatoes, and a small rice pudding. These she carried into the dining-room, where the table was already prepared for Julia's dinner, and added another plate and knife and fork. Then she went back to her ironing.

"Now, Susie," said Julia, "while we are having our dinner you must tell me all about it, only you must not cry any more, you know, for tears are salt."

It was not a long story. Susie's mother was a widow and went out to do washing. She was not strong and the work was very hard for her. There were only two children. Jack, who was younger than Susie (and she was only 12), earned a little money by delivering an evening paper; and Susie thought she ought to earn something too. She knew a girl who went out with a basket and sometimes made a dollar a day. So she had begged her mother to let her go.

"Mother didn't want me to do it," she said, "but I kept begging and teasing till she gave me a dollar she was saving up for a pair of shoes. I thought I could get another to-day and buy them for her right off; and now—" Susie's voice choked, but she made a brave effort and went on—"now I haven't got a cent to take home to her."

"Perhaps you will do better to-morrow," said Julia. It was the only comfort she could give. She was greatly perplexed; she had brought the girl home forgetting that her mother was going to the country to spend a few days and sure of her ready sympathy and assistance. Now, what could she do?

The door-bell rang. There was no mistaking the quick, decided ring. Julia sprang up. "I will go, Nora," and she flew to open the door.

A tall, elderly woman stood there, energy and promptitude plainly legible in every line of the straight, upright figure and the thin, pale face; but quite as much of kindness in the dark-blue eyes and the winning smile with which she greeted Julia.

"O Aunt Ann, how glad I am to see you! You've come just in time to help me."

"What is it now?" Aunt Ann asked in a tone of amusement, as if she were accustomed to such demands for assistance.

"Oh, I haven't torn my best dress, or sprained my ankle, or upset the washstand this time. I've got a poor child on my hands who must be helped, and I don't know what to do with her."

"Where is she?"

"In the dining-room, eating her dinner."

"That's a good beginning," said Aunt Ann, who had gone straight to the spare bedroom and was putting away her bonnet and shawl. She had come to stay, and she waited for no invitation to make herself at home. "What do you know about her?"

Julia told the story.

Aunt Ann made a queer little sound in her throat, as she often did when annoyed by the stupidity of other people.

"I hope it will be a lesson to her," she said.

"Well, don't scold her, auntie," said Julia, coaxingly.

"I will if she deserves it," said Miss Ann; "now we will go and talk to her."

But there was no scolding in the kind tone in which she spoke to the girl who had finished her dinner and was waiting for Julia's return.

(Concluded in our next.)

GOOD HEALTH.

Treatment of Bright's Disease.

The increasing prevalence of this disease renders any general information in regard to it, coming from an authoritative source, of considerable interest. We give the following from Semmola, of Naples, taken from an article published by him in the *Wiener Medizinische Blatter*. He advises strongly against allowing a patient who is suffering from nephritis to come in contact with cold in any avoidable way. Such patients are excessively sensitive to cold, and cold baths are followed by great shock and depression. Violent massage and exercise of the muscles the author also strongly deprecates as followed by great shock and weakness.

He would advise the patient to live in a dry and equable climate; to strictly avoid all exposure or going about in severe winter weather; to practice mild gymnastics in a comfortable room rather than venture into a temperature below 18 or 20° C. The author emphasizes the remarkable sensibility of the skin of the sufferer with Bright's disease to all variations of temperature. Sodium iodide and chloride is advised in doses as large as tolerated. When, after two or three weeks, albumen has not entirely disappeared and dropsy has been relieved, phosphates of sodium or calcium are given in quantities as large as 40 grains or a dram daily. The efficacy of these drugs the author believes consists in their power to promote the assimilation of albumen.

The methodical inhalation of oxygen, which Semmola has urged since 1867, has been repeatedly proved to be of the highest benefit. Albumen soon disappears after its use, and although casts may remain in the urine, the patient's general condition is so much improved that the author thinks we have here an argument for the dyscrasic or hæmatogenic origin of Bright's disease.

All astringents are considered not only valueless, but also injurious. Especially is the action of ferrum sesquichloratum and plumbum aceticum thought injurious, because of their astringent influence on the capillaries of the skin.

OBESITY CURES.—Prof. Wenternitz, a German medical writer, has written a series of papers against the numerous obesity cures which have of late attracted so much attention. These interesting papers conclude as follows: "Methodic excitation of sweat, influence of cold, appropriate and systematical work increases the physiological fat-combustion so powerfully that these factors not only deserve more attention than has been hitherto bestowed upon them, but also render useless the strict and one-sided cures as employed at present." Work is the great natural invigorator of the human system. When man was told he must get his living by the sweat of his brow, it was more to teach him the true way to promote health than as a sentence to punishment. Exercise—work—is the best preventive of all the "ills that flesh is heir to" that was ever devised.

LOCKJAW CAUSED BY A COLD.—John McDermott, of Stephentown, recently died in Hudson, N. Y., after three days' illness, of lockjaw, caused by a severe cold. It was a very rare case. The physicians attending him had never heard of such a case.

DOMESTIC ECONOMY.

Veal Cutlets.

Wipe, remove the bone, skin and fat from a slice of veal; cut into pieces for serving; season with salt and pepper; roll in crumbs, dip in egg-crumb, and egg and brown in salt-pork fat; put into a stewpan; make a brown gravy by browning, one tablespoon butter; add two tablespoons flour; pour on slowly two cups hot stock or water; season with salt and pepper, add one tablespoon mushroom catsup and one teaspoonful Worcestershire sauce; pour over the cutlets and simmer 45 minutes.

A well-known marketman says people often ask for veal for cutlets, but they haven't the remotest idea what portion of the meat they wish. A slice from the leg is used, and it should not be very thick; if too thick, pound it. Cut up into pieces of a suitable size for serving, and if some are not of good shape, skewer into form with a toothpick, and this will hold them in place until stewed, when it can be removed.

The object of the frying is merely to brown the cutlets.

Water will do as well as stock for this brown sauce, as the cutlets are to be stewed in it. For a brown sauce, which is to be poured over a dish of meat, the stock is better on account of the added flavor.

The two tablespoonfuls of flower is a rather large amount, but when flour is browned it needs a greater quantity than when a simple thickening is desired, as the browning uses up some of the starch of the flour and so reduces its thickening power. Season as directed in the recipe. Many will prefer the flavor of the mushroom catsup and will use that exclusively. Pour the sauce over the cutlets in a saucepan, cover and stew slowly for three-quarters of an hour.

This is an excellent way in which to cook veal, as it gets thoroughly done and is very tender—a consummation most devoutly to be wished in any dish of veal.

Advice Wanted.

EDITORS PRESS:—Will you kindly publish a recipe for a meringue that will not *fall?* We know of a number of apparently good recipes, but invariably, when taken out of the oven and allowed to stand for a short time, the meringue falls and becomes tough, like leather.—Z. B.

What have our readers to say on this point? EDS. PRESS.

BREAKFAST EGGS.—Boil six eggs 20 minutes. Remove shells and take out the yolks; cut the whites and six mushrooms into dice; melt one tablespoonful butter, add one tablespoonful flour, pour on slowly one cup hot white stock and two tablespoonfuls cream; add one bay leaf and one slice onion, the whites of the eggs and the mushrooms. Cook five minutes; take out the onion and the bay leaf, put in the yolks and serve.

RAGOUT OF BEEF.—Cut one pint cold meat into one-half-inch dice, removing fat, bone and gristle. Put the meat into a stewpan, cover with boiling water and simmer slowly two or three hours; then add one-half can mushrooms, cut fine, two tablespoonfuls wine; salt and pepper to taste. Wet one tablespoonful flour to a smooth paste with a little cold water, stir into the hot liquor, cook ten minutes and serve.

LENTIL SOUP.—One cup lentils, soaked for several hours. Put them on to boil in three pints cold water; simmer until dissolved. When soft, rub through a strainer. Thicken with one tablespoonful butter and one tablespoonful flour cooked together; add one-half teaspoonful sugar, one teaspoonful salt and one saltspoonful pepper; add water, milk or stock to make the consistency you wish.

POLISH FOR KID SHOES.—In answer to a recent request for some preparation for polishing kid shoes without cracking the kid, H. Lucke, of 24 Geary street, says "Glycerole" will answer.

The Week.

Perhaps the most exciting topic of the week in agricultural circles is the wheat rush. Sales of wheat which has been held some time in store has sold as high as $1.77½ per cental, to the great advantage of the holders. There is a wide disposition to sell the coming crop, and we hear of "seller 1887" at $1.67½—with the grower entering the gamble and taking the chances therein. We have always advised against such propositions, and we trust that all inexperienced people will take the trouble to inform themselves as to the burdens they assume. It is just possible that some turn in affairs may call for more money than they will find it convenient to put up.

The season has advanced well during the week. Growth in field, orchard and garden has been magnificent, and no general disasters have portended. The fruit crop is safely advancing. The importance of thinning out and thus securing acceptable size cannot be too strongly urged. Size is of the most advantage when there is an immense amount to be marketed, and this is just the time when there is most small fruit. The close of the week will end a most delightful April, and as the 1st of May will occur on Sunday, it will fall to the lot of April to crown the May Queen.

Give the Law a Trial.

The effort to put in operation a piece of radical legislation is like breaking in a new pair of shoes. The body politic may limp a few days; sundry corns may give painful evidence of alarm. One almost sighs for the old customs, laws and ways of doing things. At least this is the experience the public is just now passing through in regard to the application of the interstate law. It was enacted in obedience to a popular demand for more adequate relief against existing or possible abuses. It is the first time there has been a general movement to curb the growth of corporate power, and settle the question whether the people or the railroad companies shall dominate the Republic. That it will pinch at some points, that some interests may suffer for awhile, is not strange. This is apt to be the result of all economical and police regulations. The quarantine is often very inconvenient. The law that closes the gambling dens entails distress on the owners of the property. The Emancipation Proclamation beggared thousands. With all the drawbacks and defects, real or imaginary, there can be but little doubt that the interstate law will result, all in all, for the public welfare, the good of the greatest number, the aim of all just legislation. It is undeniable that it will cure certain abuses. It prohibits the free pass system by which so many politicians and editors were cheaply bribed. It prevents discrimination among shippers. Every one knows how giving of special rates made the Standard Oil Company the most despotic monopoly in the land, and has tended to break down the just and natural law of competition in other directions.

It is the long and short haul clause that has given the chief uneasiness to the public mind. The action of the railroad companies in making a schedule of advanced rates has produced widespread alarm. And this is not strange, for it requires very little knowledge of commercial principles to see that, were this policy adhered to, it will be destructive of several important industries on the Pacific Coast. This pushing up of rates may have been done in a moment of petulance to bring the law in bad odor, but, be this as it may, it is obvious that business principles would soon bring about an equitable adjustment of affairs. The long hauls are between competing points, and now that pools are abolished the road that suspects it is not getting its share of the business will be certain to cut rates. Then there is no law to prevent shippers directing their trade to the lines that give the best terms. Hitherto this could not be effective, since the earnings of the roads were distributed according to a fixed percentage, whether one line or another carried the freight. Then the transcontinental lines that have little or no competition cannot afford to kill important industries in a mere spleen. A corporation, no more than a man, is disposed to cut off its nose to spite its face. It is certain these carriers can adjust freights upon a competitive basis and make a fair profit, for it is common fame that during the war of rates last year, when charges were reduced to 50 and in some cases to 75 per cent, traffic was so largely increased that the roads paid quite as well, if not better, than under the old and more exorbitant schedule.

But be all this as it may, it is now apparent that this law possesses elasticity sufficient to meet all exigencies. The first impression was that the Interstate Act made no provision for granting special privileges to certain commodities. Somebody may have taken a spiteful interest in creating that impression. However that may be, it is certain that no danger lurks in that direction. The Commissioners say in their reply to the petition of the Traders and Travelers' Union:

Congress has not taken this management of railroads out of the hands of the railroad companies. It has simply established certain general principles under which interstate commerce must be conducted. It has enacted in Section 1 that all charges for interstate transportation "shall be reasonable and just," has prohibited in Section 2 all manner of unjust discriminations, has forbidden in Section 3 all undue and unreasonable preferences and advantages, has required in the same section reasonable and equal facilities for the interchange of traffic, and has prohibited in Section 5 the pooling of freights.

That, in substance, is the interstate law. There is nothing novel in these provisions. They simply bring back the business of common carriers to the well-settled principles of common law.

Under this interpretation there is no apparent reason why shippers of fresh fruits, canned goods, wool, raisins and other commodities may not secure special freight privileges. Matters at present are in temporary suspension, but it is already foreshadowed that the Commissioners will construe and apply this law in accordance with its scope and spirit, which is that transportation "shall be reasonable and just."

Later.

The special apprehension which existed in California as to the working of the law with reference to our products, which must seek Eastern markets, has been set at rest for the time being. It was telegraphed from Washington, April 23d, that the Interstate Commerce Commission had made an order suspending the fourth section for 75 days, subject to revocation and with the proviso that intermediate rates shall not be raised above those in force April 20th. This applies to the Northern Pacific, Southern Pacific, Atchison, Topeka & Santa Fe and St. Louis & San Francisco lines.

The fruit interest has received special consolation in the following assurance from the chairman of the Interstate Commission:

WASHINGTON (D. C.), April 22.—*S. F. Leib and others, San Jose, Cal.:* Railroad officials state to us that the present tariff on fresh fruit is satisfactory and no changes are proposed. We see no provision in the law for preventing the establishment of fair and reasonable rates to Eastern points for fresh fruits. T. M. COOLEY.

Another dispatch was sent by the fruitmen to Judge Cooley asking if the same construction of the law will be made as to dried and canned fruits. If this should also be granted it will relieve much anxiety and beget confidence in the satisfactory disposition of our grand fruit crop which is now progressing toward maturity.

In the matter of wool freight rates, the suspension of the section of the law which has worked such advance may relieve the situation for the present, although at this writing it is not known what the rates will be. Our woolmen will have to figure on certain opposition from the East in their efforts to perpetuate low rates. It is telegraphed this (Wednesday) morning from Philadelphia as follows:

Charles M. Hill, secretary of the Philadelphia Wool Merchants' Association, writes to the Interstate Commission, inclosing a copy of resolutions of the association, protesting against the suspension of the long and short haul for Pacific wools. In its preamble the document recites that the rates from San Francisco so the East have been from 50 to 62 cents per 100 pounds, while from many nearer points it has been from $3 to $4.50.

We imagine this is really a sharp move of the wool importers to give them an advantage over California wool which comes in competion with their wares, rather than any care for the American producers.

Grasshoppers in Sacramento County.

It seems likely that there will be a grasshopper attack of greater or less extent this year, as it is reported from Galt that the young locusts (*Melanoplus devastator*) are appearing in considerable numbers. The region about Galt suffered considerably two years ago, and the evil extended also to other parts of the valley. Our readers will remember the ways of killing them, which were fully described in the RURAL at the time. Should the visitation prove serious, we will reproduce the information. Prof. Riley, in an interview, briefly enumerated these remedies as follows:

At this season, while they are yet unfledged, they may be killed in large quantities in various ways—crushed by rollers on smooth ground, burned in windrows of straw, or trapped in ditches. A dry ditch, properly made, will intercept their movements and kill vast numbers, especially if deeper pits be made at intervals in the bottom of the ditch. A scum of coal oil made to float on an irrigating ditch will destroy all that are driven into it. One of the best remedies, especially when they begin to get their wings in June, is to kill them with poisoned bait, made of one part of arsenic to six parts of bran, moistened with sweetened water, or syrup diluted in water. The cheapest wholesale way of clearing large grainfields is to draw shallow sheet-iron pans over the field, the bottoms of the pans to be covered with coal tar or coal oil.

Fortunately for California, locust visitations are not general, as they are on the great plains. There, is, however, much harm done in infested localities, and remedial agencies are important. We should be glad to hear from our readers if they find the insects encroaching upon them.

Olive Oil Prospects.

Those who have planted olives and are in doubt about the outlook of the industry, and the possible adjustment of demand and supply, will find much comfort in some remarks which the Los Angeles *Tribune* reports as coming from Ellwood Cooper, of Santa Barbara, the well-known olive-grower. He said olive oil-making (if you know how to do it) is the easiest possible way of making money. The demand is increasing 10 times as fast as the supply. Last year he sold his oil for $12.60 per case; this year he has advanced the price to $24. He says this advance puts the oil beyond the reach of most people, it is true; the demand will be for invalids and medicinal purposes; but he can sell all he can make at that rate. He is increasing his olive plantation as fast as possible.

This confidence of Mr. Cooper is certainly refreshing when mails and telegraphs are bringing such doleful items as the following:

The former great industry at Florence of making their flasks for olive oil is said to be wholly destroyed by the English flooding the market with cottonseed-oil imitations, which is now almost universally sold under the name of olive oil. The matter, it is said, is going to be raised in the House of Commons, under the Adulteration Act.

It is quite possible that the last sentence gives the key to the future of olive oil. If legislative enactment in all countries can be had against selling cottonseed oil as olive oil, the genuine article will certainly be vastly helped. Cottonseed oil is a good oil, but not to be sold under a false name. Let it be sold for what it is. Keep it out of olive oil, keep it out of butter, and it is all right. It is quite possible that relief may come to the olive oil as it has come to genuine butter, by laws against selling the false as the true. California has asked Congress to do this, and will continue to ask it, although with the great cottonseed interest to fight in Congress, the right will be a difficult one to gain.

PLEURO-PNEUMONIA.—The United States Department of Agriculture is now ready for action under the new Animal Industry bill passed by the late Congress. Governor Bartlett has received from Commissioner Colman a certified copy of the new rules and regulations for the suppression and extirpation of pleuro-pneumonia. They provide for the work being done entirely by the United States Inspection Bureau of Animal Industry, and all expense is to be paid by the National Government. The cooperation of State authorities is invited, and whenever the rules cannot be enforced in the State from any causes the commissioner will quarantine the State from shipping any cattle to other States, Territories or foreign countries.

SERVED HIM RIGHT.—The Carson *Tribune* tells how an angry teamster the other evening was beating one of his mules on the head with a wagon-stake most unmercifully, when the mule ahead came to the aid of its comrade, and flinging out both heels caught the two-legged brute in the abdomen and laid him severely out. The S. P. C. A. should make mule No. 2 an honorary member.

NEW SUPERINTENDENT AT VINA.—Capt. H. W. McIntyre, of St. Helena, has accepted the superintending of Stanford's mammoth winecellar and 3000-acre vineyard at Vina. Immense buildings are now under construction which will contain all the latest improvements. Capt. McIntyre is president of the State Grape-Growers' Association and a man of wide experience in winemaking.

THE EXPERIMENT STATION LAW.—If newspaper reports are correct, the U. S. Attorney-General has decided that there is really no money appropriated for the carrying out of the new law for experiment stations, and that nothing can be done until another session of Congress, when a specific appropriation must be made.

A GENTLEMAN who resides near Ætna Springs, Napa county, informed us this week that the springs seem to be prospering. The farming interests thereabouts all look well. The grain prospects are good, and all the residents are in high spirits at the encouraging outlook.

THE big land grants in San Luis Obispo are being divided.

The Subterfuges of Criminal Practice.

A Scotch judge, who had spent some time traveling through this country, made the remark that America had good criminal laws, but they were applied with such uncertainty as to be well-nigh worthless. The charge is true. The technical absurdities of the Criminal Court are so well known that it has become proverbial that the average criminal trial is a judicial farce. Is the man guilty of the crime charged? is the only question that common sense asks; and it would seem as easy to ascertain as any other fact, but the proceedings of the court, to the uninitiated, at least, seem a cunning device for preventing that discovery. Indictments or informations are quashed for the most frivolous informality. The very best men in the community are excused from the jury because they have formed or expressed an opinion predicated upon a rumor, and the challenges are used not to secure an intelligent and honest jury, but to impanel 12 dunderheads.

But if it happens that a good jury is found that promptly discharges its duty, as in the Goldenson case, then comes a motion for a new trial, based upon preposterous assumptions and suspicious affidavits, that may be easily forged to order, by methods known to the shrewd practitioner, and if the motion is denied, then comes an assignment of errors, usually a string of trifling technicalities, mere quiddities of the law. This is bundled into the Supreme Court, for what is the Supreme Court for but to hunt for flaws in the proceedings in the court below? It is not the question of guilt with which they are concerned, but with the jots and tittles of the proceeding, and that would be a remarkable Supreme Court that could not, after a microscopical search, find some slight inaccuracy in the rulings of a Superior judge. It took two years to hang the strangler Wheeler, because the presiding judge had allowed the District Attorney to read a few passages from "Brown's Medical Jurisprudence" to strengthen his argument. This may be the law according to ancient sheepskin literature, but to the average man it is mere word-dawdle and a trifling with justice.

It is this equivocal practice that encourages the attorneys of Alexander Goldenson, convicted of the murder of little Mamie Kelly, to argue that a new trial should be granted on the ground that the jurors had read the newspapers during the trial which contained statements prejudicial to the defendant; that they arrived at their verdict by lot; that some one was willing to swear that the defendant's grandfather had been crazy for 30 years, and more balderdash of the same sort. The lawyers are not to blame. Catching at straws to save a drowning client is their trade. It is the system that hedges the way of justice with dilatory pleas and absurd subterfuges that is open to criticism.

In this case there is no cause of complaint against judge or jury—the jury did their duty and Judge Murphy has held the scales of justice with a firm and impartial hand. The proof is invincible that Goldenson brutally murdered an innocent and unoffending schoolgirl, and the plea of insanity is a thin mask to conceal depravity most foul, as it usually is. This case will most likely go to the Supreme Court, and should it turn out that pitfalls and loopholes are discovered in the proceedings sufficient to result in setting this monster free or softening his penalty, then it will be only one more proof that the whole system of criminal practice needs overhauling.

Irrigation Map of the San Joaquin.

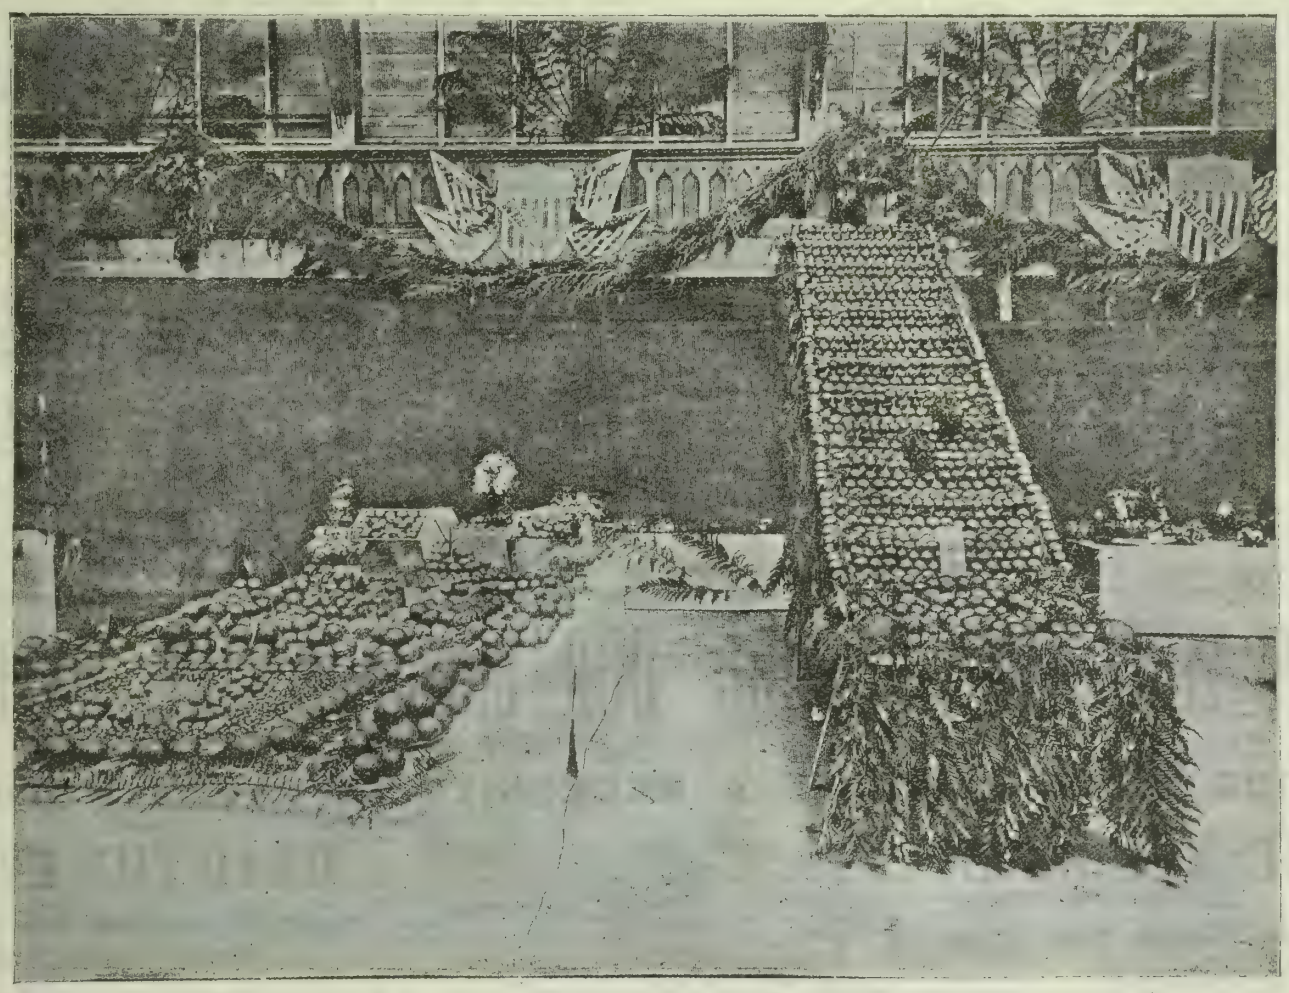
It was clearly shown during the last session of the Legislature that the State Engineer, Mr. Hall, had secured during the years of his incumbency a valuable collection of data concerning irrigation in California, and that much of it would soon appear in form for public use. We have mentioned several times his large map of the San Joaquin valley on the scale of two miles to the inch, which was so full in topographical features that it would demonstrate the feasibility of any projected enterprise in distributing waters. We are glad to learn from the *Record-Union* that Mr. Hall is about to issue a reproduction by photolithography of his large map. It will be reduced in size so as to represent three miles to the inch and will be issued in four sheets, of which the first covers the vicinity of Stockton, the second that of Merced, the third that of Fresno and Visalia, and the fourth the region from Tule river, south to Bakersfield. Of the map, as a whole, the *Record-Union* says:

It is a fine exhibit of the topographical features of the valley. The foothills around the valley are indicated by carefully executed hachuring, and are covered with a tint of brown. The alignment of water-courses and canals received especial attention, and no other map exists showing so fully and accurately this class of information in any part of the region covered. The intricate network of rivers, creeks, sloughs and canals in the Visalia district, those of the Kings river country, and of the Merced district, as well as the drainage lines in San Joaquin county, are here, for the first time, correctly mapped.

This map is rendered especially valuable by affording a reliable key to the general elevation of the ground in all parts of the valley. Contour lines or lines of uniform elevation are shown on it, generally 20, occasionally 10, feet apart in vertical elevation. These are based on the results of special surveys and a careful compilation of data collated from every available source.

At notable points along the main water-courses, elevation of low water, of ordinary high water and of extreme floods are given.

A concise history of Tulare lake is printed on the map. The location of all artesian wells in San Joaquin valley is shown, together with a number for easy reference to the information collected for each in the volume of physical data, soon to be ready for distribution.



On the map are shown in a light red tint the lands capable of being irrigated from large canals with water from the streams entering the valley from the east. In a darker red tint the lands are indicated which are at present covered with water rights. Bottom lands are tinted green; swamp and overflowed lands lighter green; irrigated lands blue, etc., making the effect of the whole at once pleasing and very convenient for reference.

Here for the first time are designated on a map the irrigated lands of the Kern river delta, the scattered tracts of irrigated lands along Tule and Kaweah rivers, the great extent of irrigation from Kings river, the lands commanded and those irrigated by the canals on both sides of San Joaquin river, the irrigations from Merced river, etc.

The map shows at a glance the great possibilities for a future extension of the irrigation works in the valley and the desirability of utilizing to the fullest extent possible the vast volumes of water which flow to waste during the annual high stages of the river.

A Handsome Design in Fruit.

Our flower and fruit fairs are calling out from the creative California mind many designs which add much to the interest and beauty of our exhibitions. We have given pictures of some of these in previous issues of the RURAL. Quite a number more will be mentioned in connection with descriptions of the various flower shows, which may be found upon another page. The design, of which an engraving is given herewith, is one which accords well with the popular idea of California. It was wrought out at the recent Citrus Fair at San Jose, and was called the "Golden Stair." The epithet golden, in modern parlance, pertains to but two parts of the universe—California and the Abode of the Blessed; and there may be thought no sacrilege in the association, for California is the nearest approach to heaven which limited geographical extension admits.

THE GOLDEN STAIR—A DESIGN IN ORANGES AT THE SAN JOSE FAIR.

The Golden Stair, as shown in the engraving, found its most literal significance in the material used in its construction, which was oranges; and the richness of their auric hue, which, unfortunately, the printer cannot catch, attracted all eyes and led to more careful study of the design. The engraving does not give adequate idea of the hight of the design, as the photograph was taken from above. The stair, which was designed and constructed by Dr. W. S. McMurtry, of Los Gatos, extended from the main floor to the balustrade of the gallery—the distance being that at which galleries are commonly hung in pavilions. The entrance to the Golden Stair was marked on either side by two immense pumalos, thus forming a portal which was not inaptly called the Golden Gate. At the head of the stairs, hovering above it, was a golden dove made of acacia blossoms, while at the foot were golden slippers made of marigolds, by Miss Adda C. Munn.

Upon the left of the engraving is a very handsome table of fruit which also shows much taste in arrangement. Dr. McMurtry received much credit for his contribution to the fair.

Possibilities of the Sugar Business.

The United States consumes 1,200,000 tons of raw sugar annually. Of this amount Louisiana produces 150,000 tons; the Eastern States 35,000 tons (maple sugar); the Sandwich islands (free of duty) 65,000 tons. The balance, 950,000 tons, comes to us from the various cane-producing countries—chiefly (about 75 per cent) from Cuba. A small amount of beet-sugar finds its way here from Europe. From the above figures it will be seen that this country sends abroad about $57,000,000 annually, and pays in duties half as much more for an article, all of which would be produced at home in the form of beet-sugar if the National Government could only be induced to take the proper steps to encourage such industry. The complete success which has attended the manufacture of beet-sugar in this State, against the free importation of cane-sugar from the Sandwich islands, affords abundant proof that such is the fact. Why other factories than the one at Haywards have not been established here is a surprise to every one who does not understand the mysteries of sugar manipulation in California. The same power which has continued in idleness the large sugar plant on Eighth street in this city for the last 15 years, or more, has, no doubt, been that which has thus far prevented the establishment of other beet-sugar manufactories in this State. If California could throw off this powerful influence, and convert her wheatfields into beet culture, it might readily add from 10 to 15 millions to our annual agricultural products and fully half a million to our population.

It is announced from Washington that the Commissioner of Agriculture has concluded arrangements for carrying on sugar experiments during the coming season in New Jersey, Kansas and Louisiana. In New Jersey, at Rio Grande, a series of experiments will be made to determine the possibility of manufacturing sugar on a small scale profitably. At Fort Scott, Kansas, arrangements have been made with the Parkinson Sugar Company for trying a new system of cleaning and cutting cane and preparing it for diffusion. Experiments will also be made in the use of lignite or soft coal as a filtering and discolorizing medium. In Louisiana a committee of the Sugar Planters' Association has selected the plantation of ex-Governor Warmoth for experiment in that State. The latest and most improved of circulator diffusion battery is already building for these experiments, and with it will be used a form of cane-slicer, which has already given perfect satisfaction in Java and Australia. An apparatus will also be erected at this station for practicing the process of carbonatizing both mill and diffusion juices. The lignite process of filtration will also be employed and a comparison made between the results of milling and of diffusion.

THE railroad from Ballona harbor is now completed nearly to Los Angeles. The San Francisco Bridge Company is pushing the work on the piles at the mouth of the harbor. The heavy dredge will not begin inside the harbor until June, and then the digging will continue until a depth of 30 feet is obtained.

THE loss to Pacific Coast shipowners during the recent severe gales which have swept our coast is estimated at from $700,000 to $800,000. Since November 15th last over 20 vessels and 90 lives have been lost.

Flower Festivals.

Of the floral festivals that have been held during the past fortnight, such ample and elaborate reports pour in upon us from north and south as would easily fill pages upon pages. First in the alphabet and highest on the map comes

Chico.

Whose second annual display of flowers opened Thursday evening, April 21st. Armory Opera hall was transformed into one vast bower, whose brilliant beauty of blended hues and rich perfumes proved quite enchanting.

The most conspicuous feature as one entered the hall was a pyramid of various choice exotics and flowering plants from Gen. Bidwell's hothouse. It rose to a hight of 15 or 20 feet—a mass of rare and beauteous blossoms, surmounted by a palm.

Among the designs were the flags of many nations, placed at the upper end of the building. Largest and foremost was "Old Glory," six feet by four, the stripes of white rosebuds and red geraniums, the background for the stars blue larkspurs, and the stars themselves marguerites. This was the work of Mrs. E. T. Reynolds. The flags of France, England, Prussia, Germany, Russia, Italy, Spain, Denmark, Iceland, Japan, China, Siam, Egypt and Mexico were exquisitely done, on a smaller scale, by as many persons.

Very handsome was the full-rigged ship "City of Roses," borne on a blue sea of wild flowers. Her hull was made of roses—reports agree in this, but differ as to their color; her deck was pink; her rigging of white tuberoses, and her sails of snowball blossoms, with her name wrought across them in carnations.

A large swan made of white pinks, with a collar of violets about its neck and swimming in a basin of roses, was much admired. It was sent by Huntington, Hopkins & Co., of Sacramento.

Another design that attracted much notice was a great watch of marigolds, lettered with a big "S" in purple pansies. It was shown on a background of blue velvet and looked very natural.

Lake Tahoe in miniature consisted of a clear mirror, around which, artistically disposed ferns and mosses stood for the grassy shore, while trees were represented by small palms and shrubs. A tourist, made of roses, lay in a hammock, and appeared to be listening to the ripple of the waters.

The three links of the I. O. O. F. formed a design about six feet long and three wide. The background was pure white snowballs, and on this the links were worked. The left was made of pink roses, the center one of purple larkspurs and the right of dark-red roses. This was perhaps the most elegant piece on exhibition.

Several fine displays came from the Bell conservatory. Thirty-two varieties of choice roses, all labeled, were shown by Wm. Proud, from General Bidwell's gardens.

It is impossible for us even to mention more than a few of the most marked exhibits, and we refrain from giving names, in most instances, since so many must be passed unnoticed. The bouquet, fancy goods, refreshment and Japanese booths, and the candy wigwam, must barely be alluded to.

There were many visitors from S. F., Oakland, Sacramento, Marysville and neighboring towns, and the throngs attendant were lavish in their praises, agreeing that Chico's second floral fair outdid the first in the wealth of flowers shown, the number of designs and the taste evinced in th eir making.

The festival proved a success financially and otherwise, and closed on Saturday night "in a blaze of glory."

Los Angeles.

Two weeks ago the auspicious opening of the third Annual Flower Festival, at Los Angeles, we briefly chronicled. The papers of that city have since been teeming day by day with long detailed accounts of the fair's progress, up to its triumphal ending Saturday evening. We cull and condense a very scant report.

The festival was held in Hazard's pavilion—a large unfinished building, destined for an Inventors' Institute—176x120 feet upon the floor, with a hight of 100 feet to the apex of the roof, and having a gallery on three sides. The available exhibition space was about 47,000 feet, counting balcony and vestibule.

The floor-space was laid off with aisles radiating from the great rose-bank spoken of in our notice of the opening. This bank contained some 25,000 roses arranged in stripes of different hues. A fountain rose from a bed of callas in the center; then came the stripes of roses, alternating with cedar and cypress boughs for two-thirds of the circumference, narrow in front, but merging toward the rear in one broad sweep of mingled tints, from the darkest Black Prince to the whitest Bon Silene.

The roof, balconies and pillars were decorated with fans of palms, stars of agave, festoons of evergreens, and boughs of pepper tree and cypress.

The "Ship of State," the most prominent of all the designs, had its hull of red geraniums, the words "Southern California" banded in white pinks, the spars and rigging of evergreen. It reposed on a sea of verdure and many-tinted pansies, and bore a cargo of orange-branches laden with the yellow fruit.

Another noticeable piece was the huge slipper of marguerites, in pink and dark-red geraniums, the top of smilax, the lacing of dark-red pelargonium, and the heel of marigolds.

The Old Mission church of San Gabriel was marvelously represented in a design 12 feet long, four feet wide, and five feet high. The walls were built of marguerites, the abutments of cypress, and in the bell-towers hung tiny abutilons. The roof was of dark geranium, imitating tiles.

In the orange booth, a Maltese cross of pansies in a bed of sweet alyssum was especially admired. A wonderful cluster of 32 large oranges hung from the center of this booth.

In the Santa Monica booth, violets in a broad expanse simulated the ocean, and laved the shore of pelargoniums, above which rose bluffs of moss. A wharf of roses and ivy stretched out for some distance, and a steamer of marguerites and marigolds, with stack of ivy and rigging of smilax, was heading for the dock.

The bulbous booth was very interesting to connoisseurs. There were John McMannis' large and valuable collection of potted bulbous plants, including a beautiful variety of ixia and some deep-red Italian anemones; Mrs. Harris' potted gladiola; Mrs. A. M. Hough's large collection, some of which are very rare—as the pelargonium triste, allium narcissum, iris kampferri, Japanese and Spanish iris, etc.

The special rose booth constituted one of the most interesting exhibits. It was in the shape of an outline star, the lines being in evergreen, trimmed with ivy. In banks along its sides were shown the pick of the choicest gardens—the rarest varieties and the finest specimens of all varieties of roses, all carefully and legibly labeled. One day there were 200 different varieties. Mrs. Noel, of East Los Angeles, here exhibited a single stalk bearing 57 buds and 13 full blown Washingtons.

On the night of April 19th, the natives were astonished, for there in front of the stage rose in crystal brilliancy an "ice palace," nine feet square at the base, six feet high, and containing five tons of ice. It was beautifully modeled, and with its walls, parapets and towers glittering in the electric light, made a spectacle long to be remembered. It was designed by Rev. M. F. Colburn, and the ice was contributed by C. M. Coulter, of the Home Ice Co., and G. E. Milliken, of the Los Angeles Ice Co., who erected the building. The weather was so warm that the palace melted within 24 hours.

At the beginning of the second week the flowers were all renewed by the bevy of busy lady-workers, and the festival "came out in a brand-new dress," looking handsomer than ever.

The nightly attendance was reckoned by thousands. Nearly every evening was spoken of as a "crush" or "jam," there being as many as 7000 in the pavilion at once—and sometimes it was with no little difficulty that the allegorical procession of sylphs, fairies, pucks and posies made its way around the building. Beside the charming tableaux and processions, a variety of entertainments were given on different nights by the Band of Hope, the Bicycle Club, the Seventh Infantry Band, and the Uniformed Rank K. of P.

One incident, too interesting to pass unnoticed, was the receipt, by Mrs. Judge Widney, of the following missive from three little girls:

EAST LOS ANGELES, April 16.—*To the big President of the big Flower Show:* My folks wouldn't let me go to your flower show in the evening, so we thought we would have a flower show of our own.

We only charged three cents admition, because ours wasn't so big as yours. We did not make very much, but will send it over to help you.

The little sum was 80 cents, in dimes, nickels and cents, which was most willingly put with the big sum, and gratefully acknowledged.

The *Times* of Sunday, 24th, speaks thus: "The ladies of the Flower Festival Society closed their brilliantly successful exhibit at the pavilion last night, and to-day they can rest under the benediction pronounced on good and faithful servants. It was a glorious success from every point of view, an honor to the organizers and executors, a credit to the country, a blessing to the noble cause in which the society is enlisted. The society hoped to raise by this affair at least $7000, to pay off the indebtedness on its Flower Festival Home, erected and furnished during the past year. The proceeds are something over $11.000, so that the ladies can discharge their obligations and have a handsome fund remaining."

(Continued on page 389.)

COL. WARING COMPLIMENTED.—The State Board of Health held its regular quarterly meeting at Sacramento on the 23d. Among its doings was a resolution, passed unanimously, that "this board notices with pleasure the advent on our coast of the eminent sanitary engineer, Col. Waring, and regards it as an evidence of our progress in sanitary advancement, and trusts that our larger cities will take advantage of his presence to devise plans for improved sewerage."

OUR WINE-GROWING INTEREST.—According to the San Francisco *Merchant* there are now in California at least 4000 wine-growers, and the area planted in vines is not less than 160,000 acres. The value of this land, with the improvements, is not less than $60,000,000. Employment is found for at least 40,000, who, with their families, represent a producing population of 150,000 persons.

"BUT FOR THE 'SMOKE BALL' OUR CHILD WOULD HAVE DIED!"

SAVE YOUR BABIES! A NECESSITY IN EVERY HOME!

READ THE EVIDENCE!

What Mr. and Mrs. Tennant Think of the Carbolic Smoke Ball.

"BUT FOR THE 'SMOKE BALL' OUR CHILD WOULD HAVE DIED."

SAN JOSE, March 26, 1886.

Carbolic Smoke Ball Co.—GENTLEMEN: It is with great pleasure that we testify to the merits of your medicine, the "Smoke Ball." We purchased one of your Smoke Balls a short time ago, and used it with great success for colds in the head. Consider it the best remedy we ever had in our family. Not long since our little girl had a severe attack of membranous croup, and if it had not been for the "Smoke Ball" she would have died. The first application gave instant relief, and a few applications completely cured her. We consider the "Smoke Ball" a sure cure for croup. Gratefully yours,

F. W. TENNANT,
MRS. F. W. TENNANT.

No. 180 W. San Fernando street, San Jose.

READ THE EVIDENCE!

What Mr. Hammersley says of the "Carbolic Smoke Ball."

"I CONSIDER MYSELF ENTIRELY CURED."

SAN JOSE, March 27, 1887.

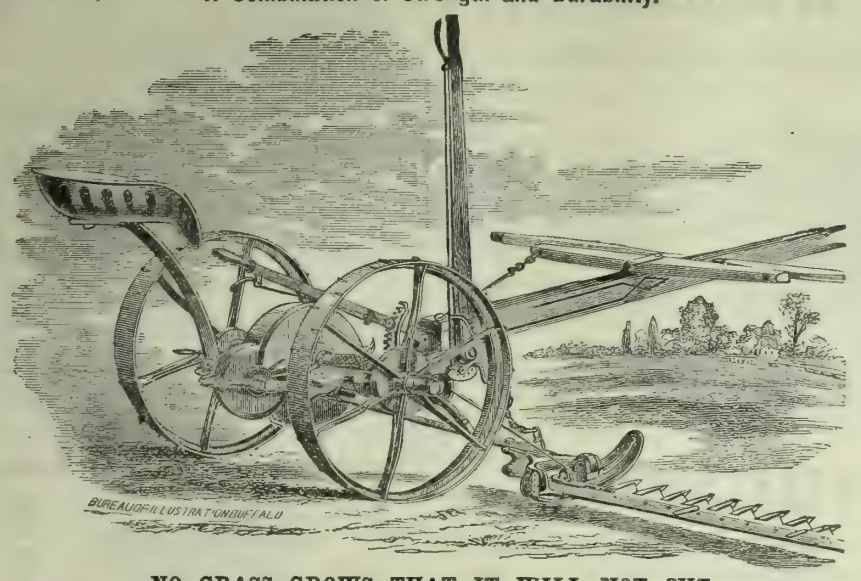
Carbolic Smoke Ball Co.—GENTLEMEN: I have been troubled with catarrh and neuralgia a great many years and have tried a great many different remedies, and have been treated by several so-called specialists—fees from $40 upward, payable monthly in advance—but never obtained any permanent relief. I have also been troubled of late with deafness in the left ear, which had been gradually growing worse. Last January I was induced by a friend to try some of your free tests, and felt a relief after the third inhalation. On January 20th I purchased a "Smoke Ball," and I now consider myself entirely cured of neuralgia and catarrh, and now I can hear as well as any one. I will be happy to indorse the "Smoke Ball" to any person whom you may wish to refer to me. Yours very truly,

A. S. HAMMERSLEY,
577 Ninth St., San Jose.

The **Only Absolute Cure for Catarrh, Neuralgia, Nervous Headaches, Catarrhal Deafness, Sore Throat, Inflamed Tonsils, Bronchitis, Granulated Lids, Weakness of the Optic Nerve, Diphtheria and Quinsy.** We have proved that the "CARBOLIC SMOKE BALL" and the "DEBELLATOR" will cure, by the numerous Home Testimonials published, and which we will be pleased to send to any address.

"IT CURED MY CATARRH, NEURALGIA AND DEAFNESS."

THE COMPLETE TREATMENT includes the "Debellator" package, unequaled as a blood purifier, which must be used in Catarrh when there is a dropping of mucus into the throat, biliousness, or where the bowels are irregular or there are stomach or kidney disorders. It should be used in all cases of Catarrh, Asthma, Bronchitis, Hay Fever and Ulcerated Sore Throat. Price of the complete treatment, $5; "Smoke Ball," $3; "Debellator" package, $2. One complete treatment is generally sufficient.



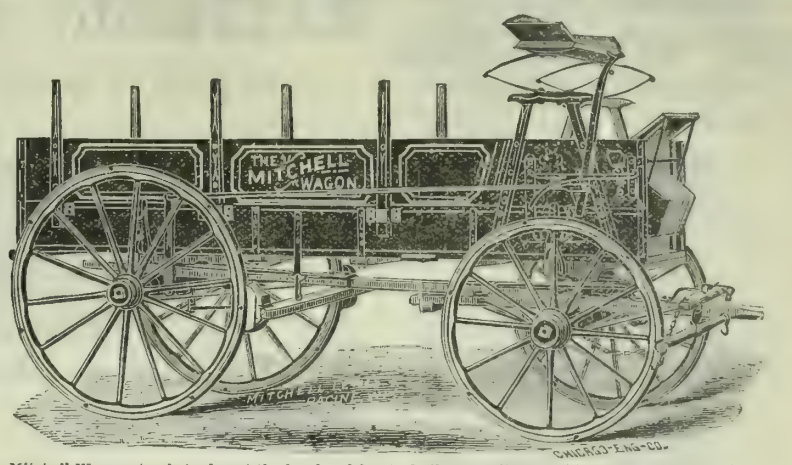
MAIL ORDERS receive careful and prompt attention. State diseases or symptoms in writing, addressing MAIN OFFICE. Complete treatment mailed on receipt of price, $5, and four cents in stamps. "Smoke Ball," $3 (four cents in stamps). "Debellator" packages, $2. Remit by post office or Wells, Fargo & Co. money order, or in coin by Wells, Fargo & Co.'s Express.

[Mention this Paper in Ordering.]

"CARBOLIC SMOKE BALL" CO., 652 Market St. {Cor. Kearny, Rooms 7, 8, 9, 10} San Francisco.

THE EMPIRE SENIOR MOWER.

A Combination of Strength and Durability.



NO GRASS GROWS THAT IT WILL NOT CUT.

In any field, whether it be heavy matted clover, or the tangled and heavy grass of the roughest meadow lands, it will go through without choking down or causing the team to stop to clear the guards, or for any other purpose.

There is none more durable; none easier for team; none with a more perfect tilt; none with lighter draft; none will cut closer; none with better pitman connection; none more compact; none more perfect in every respect.

THE MITCHELL WAGON.

The Mitchell Wagon stands to-day at the head and front of all competitors, and is known far and wide as the strongest, most durable, best ironed, best finished and lightest running wagon made in the world. They are unequaled in quality and finish, and are "MONARCH" of the road wherever known and used; are fully warranted for one year—any breakage occasioned from defects in material or workmanship will be made good without cost to the purchaser, upon application to the undersigned, with satisfactory proof of such defects.

BUY THE MITCHELL WAGON AND HAVE NO OTHER.

HOLT BROTHERS,

30 and 32 Main St.,

SAN FRANCISCO.

Our Improved Harvester will, without question or doubt, be the most popular machine in the grain field this year, as it certainly was last year, wherever used. Everybody who saw it working in the grain, running over rough ground, through hog wallows, over fields studded with trees, with as much ease and regularity as though the fields were smooth and level. Read the testimonials of several farmers who used our Harvester last year.

We have improved our machines over last year very materially, strengthening the weak points by putting in additional truss-iron braces, increasing or lowering speed when required, shortening the chain belts and substituting pivot and sliding boxes for the old fashion solid boxes, which will not give a particle as the frame warps or twists out of line. The greatest and most desirable change we make this year is discarding the sleeve on the main shaft, which caused us more trouble last year than anything else, by sticking to the shaft, making it grind the shaft and run hard. In a few weeks' time it wore away, leaving it rickety and causing the cylinder to run unsteady. This most desirable improvement makes it run one horse lighter at least.

Some of the agents of other manufacturers have sought to frighten farmers into buying their machines by telling them if they buy our Improved Harvester that they are liable to be prosecuted for infringement of patents. Now, these agents know, or if they don't know they ought to, that what they assert is false and malicious. Our Improvements are our own, and infringe upon nobody's patents. To allay all apprehension in the minds of intending purchasers, we say here that we will protect you against any and all losses on account of suits for infringements. The following are some of the advantages our Improved Harvester possesses over all others:

1. Our Improved Harvester runs FOUR horses lighter than any other machine made.
2. It is easily handled, and turns a square corner as readily as a mowing machine.
3. It is less liable to get out of order, and cheaper to keep in repair than any other machine.
4. It has no clumsy, expensive gearing to wear out or break.
5. It is run mostly by Link and V-Belts which, in case of breakage or accident, can be repaired in the field without loss of time.
6. Our Harvester makes no noise to frighten or irritate the horses, and makes less noise than ordinary headers.
7. Our Header is far the simplest and runs the lightest, and is the strongest and best. There are no Rickety Gears or Trembling Rods to break.
8. The Header may be raised and lowered instantly from any part of the Separator.
9. Our Harvester WEIGHS FIFTEEN HUNDRED POUNDS LESS than any other machine of the same capacity in the market.
10. It will cut, thrash, clean and sack more grain in a season, with less expense for labor and repairs than any other Harvester ever turned out.

Remember, all our Improved Harvesters are warranted to work well or no pay. Examine them before purchasing elsewhere. We shall sell our Harvesters upon their merits alone.

TESTIMONIALS:

GRAYSON, CAL., Feb. 21, 1887.

MESSRS. HOLT BROS.—Dear Sirs: As to your machine, we think it a good one. It saved the grain well. Had but little lost time; as to expense, $25 would cover the whole for the entire season. Number of acres cut, 1750. If we were going to buy another, we should certainly get one of yours. Respectfully, F. CARPENTER, R. BROWN.

OAKDALE, Feb. 21, 1887.

MESSRS. HOLT BROS.—Gents: I ran one of your Combined Harvesters last year. Cut 1950 acres of grain in 63 days. Did not lose over one day making repairs and replacing extras. Repairs cost about $10. I cut both light and heavy grain. It did good work, and the grain brought the highest market price, on account of its being better cleaned. I am perfectly satisfied with my purchase. I have worked with three other Combined Harvesters, and consider yours the best in the field for lightness of draft, durability and fine work.

Respectfully yours, D. W. CARMICHAEL.

GRIDLEY STATION, Sept. 22, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: I have used one of Holt Brothers' Link Chain and V-Belt Combined Harvesters, and consider it (in my opinion) the best Harvester made. This season I harvested 800 acres; averaged 23 acres per day, with 12-foot cut. I consider the draft is four horses lighter than either the Houser or the Young Machine. It does better in all kinds of grain than either of the above-named machines. I run the whole season without any breakage.

GEO. WICKMAN.

TURLOCK, Sept. 16, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: Your letter of the 8th inst. received and contents noted. In reply I will state that I think your machine is the best that is made. I cut 1350 acres of grain with it in 42 days. I did not have to repair the machine from the time I started till I quit running it. It runs lighter, and I think does the best work of any machine that I have seen. Very respectfully, ED. McCABE.

DIXON, Sept. 10, 1886.

MESSRS. HOLT BROS., San Francisco—Dear Sirs: Yours of Sept 8th at hand and contents noted. Will try to answer your questions as nearly correct as I can. Of course I have not seen all of the different Harvesters working, but from what I have seen and learned, will say that so far as my information and experience goes, your Link and V-Belt Harvester is, in all respects, the best in use. It did as good work, if not better work, than the Houser here. It pulls from two to four horses lighter than the Houser. My repairs were nothing; was not detained at all in my harvest on account of breakage. I cut 600 acres in 23 days, and moved four miles three different times. Yours truly, JOS. KLINE.

And Many Others.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded for best Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Society, and the Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. With this press the movement of the follower is 26½ inches in the first revolution of the screw; the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track. Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Gubserville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Gubserville; Lay Clark & Co., Santa Rosa Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. THE HARVEST QUEEN.

MATTESON & WILLIAMSON,

The only manufacturers in Stockton who make a specialty of making everything needed by the farmer in seeding and harvesting. Among their latest triumphs in harvesting machinery is the unrivaled

HARVEST QUEEN,

To Which They Invite the Attention of the Careful Farmer.

This machine was first placed in the field during the harvest of 1886. From the testimonials of those who have had it in use it is considered the peer of any now offered for public favor. For stanchness of build, lightness of draft, economy of manual labor and animal power, and in saving and cleaning the grain, its equal has yet to be produced. It is so furnished with efficient and ready-operating brakes that the lives and limbs of operators are in no degree endangered. A limited number of the HARVEST QUEEN are being constructed for the harvest of 1887.

ORDERS AND CORRESPONDENCE SOLICITED.

Flower Festivals.

(*Concluded from page 386.*)

Oakland.

The Fruit and Flower Fair, announced for Monday of last week, was formally opened at Cavalry hall, Oakland, on Tuesday evening, and closed on Saturday night. The main hall was tastefully arranged, with large tables down the center for the fascinating displays of cut flowers and potted plants, whose fragrance filled the air, while electric lights and a band of music added to their brilliance and witchery.

James Hutchinson, of the 14th-street nursery, had a fine stand, containing over 200 varieties, attractively disposed. His pansy exhibit was very pleasing.

Mr. Gill, nurseryman from 28th street, showed about 150 varieties of roses, also a fine collection of camellias, all grown in the open air. (He stated that had the fair been postponed a fortnight, he could have exhibited 400 varieties of roses.)

F. Delger's collection of ferns was much admired. Huge adiantums in the middle of his table threw their lace-like fronds over several varieties of lycopodium, giving just the shading of color and size required for a perfect finish. Not a point of color anywhere, save a deep vermilion-tinted amaryllis.

The State University sent an interesting exhibit of economic plants, valuable for fiber, fruit, forage or perfume. Among them is the plant that supplies the flea powder of commerce. Bamboos, sugarcane, sumac, and coffee tree, olive trees in bearing, alligator pear trees, guavas and the strawberry tree of Southern Europe are displayed. Four varieties of flax and textile grasses are shown. The perfume plants from the University are the lemon-scented eucalyptus and the lemon-grass from India, which has fragrant blades.

One of the most attractive features was the collection of beautiful orchids from the bothouses of J. C. Ainsworth, of Claremont, shown in a small glass inclosure at the eastern end of the hall. Here too stood a noble *Adiantum Peruvianum*—the tree fern of Peru—an exaggerated maiden-hair. An Australian tree fern, grown in Alameda, was represented by a frond 5 feet 10 inches in length, a three-months' growth.

A. Chabot sent 1000 callas, a large orange tree full of ripe fruit, a beautiful camphor tree, and specimens of tea plant and bamboo.

The Japanese black Iris, from the grounds of James de Fremery, is a beautiful rarity upon this coast. The blossom is a network of fibers, connected by a delicate film, and looks like the finest lace.

Mrs. Frank M. Smith's table of cut flowers in wet sand was very elaborate and handsome.

A. Smith, of Redwood road, sent lemons ripe, green and blossoms, and oats over eight feet tall—the latter, however, not of this year's growth.

The special interest of Tuesday night was the competitive exhibition of cut flowers by ladies of Berkeley, Alameda and Fruitvale. Berkeley was construed to include Claremont and Piedmont. Two ladies represented this district, Mrs. James Palache, of Claremont, and Mrs. N. Collins, of Mountain View cemetery. In Mrs. Palache's display was a collection of golden roses, Bouquet d'Or, more than 500 blossoms from one bush. Mrs. Collins' exhibit was pre-eminent for the number of varieties of roses.

The ladies of Fruitvale brought a handsome design in roses, representing an archway, some four feet high. From the center hung a basket of fruit and ferns, and moss grasses formed the base. The apex and supports were decorated with bouquets, and orange and other fragrant blossoms were there in profusion. The centerpiece upon the Fruitvale table was from the gardens of Mrs. Brendemuhl. Beside many verbenas, marigolds, geraniums, lilacs, etc., it embraced over 50 varieties of roses of a quality even Santa Barbara might envy.

The Alameda exhibit was made by the young ladies of the Alameda Fruit and Flower Mission. The mid-line of their long table was given to choice roses in lavish supply. Adjoining these came a band of Paulonia imperials, interspersed with conerarios, wisterias and marguerites; then bands of calendulas, with groups of cactus, syringa, snowballs and foliage plants. Around the central standard vase, holding lilies by the hundred, were banked roses in glowing color, giving the needed finish to a lovely display. The name "Alameda" was made of red, white and pink camellias.

A novelty was the model of a stove of the New Oakwood pattern, full size, shown by the agent, E. F. Delger. The top was of red roses and the six lids of white roses; the doors of marigolds, bordered with bachelor's buttons and fine white flowers, and the legs were covered with fleur-de-lis.

Miss Lizzie Jean Blair, and O. Holen, a retired florist, competed for a prize of $10 offered for the best and finest floral piece. Miss Blair's design was an easel six feet high, holding a pot filled with flowers, resting upon a bed of roses, three feet by eight. It was pronounced by the ladies and amateur florists the most beautiful at the exhibition; but the judges, examining the pieces more critically, awarded the honors to Mr. Holen's star. The latter was six feet in diameter. The groundwork was of sofrano, la France and Marechal Niel roses, interspersed with Marie Antoinette, Duchesse de Brabant, Madam Pernot, Lambert, Parl de Yarden, Black Prince, Lovetta and Humar. The piece was tastily fringed with green and the harmonious and beautiful effect of the whole was hightened by sprigs of maiden-hair, fern and begonias.

Other prizes were awarded as follows:

For largest and finest display of plants in pots and cut flowers during the fair, $20. The jury awards one-half the prize to James Hutchinson, as complying with the terms of the offer in the matter of plants in pots, and one-half to A. Brendemuhl for cut flowers. (The amount was increased by Mr. Bentley to $15 for each.)

Finest display of not less than 50 varieties of cut flowers, April 20, $10; E. Gill.

Largest and most beautiful bouquet, April 21, $5; Mrs. F. Delger.

Finest display of ferns, $5; F. Delger.

Competitive display, April 19, by ladies of Alameda, Berkeley, and Fruitvale, $10; to the Alameda Flower Mission.

Largest and finest flower-piece, April 22, $10; to P. J. Keller's cross and anchor, with special mention of R. Trumbull's star, and stove by E. F. Delger.

Santa Barbara.

The Eighth Annual Flower Show at Santa Barbara began on Wednesday, the 20th, and was kept up till Friday night, surpassing all that have gone before it in number, originality and beauty of exhibits.

The columns and pillars of the agricultural pavilion were decorated with boughs of palm and cypress, with huge bunches of calla lilies arrayed at the base. The front of the stage bore the words "Santa Barbara," wrought in calendulas on a bed of curled parsley. This motto was flanked by an anchor of white marguerites on one end, and on the other by a harp in the same flowers with a deep border of scarlet geraniums.

Each ward in the city and the outlying districts of Mission Canyon, Carpinteria, Goleta, Montecito and the Mesa had booths filled with flowers and plants. Orchard Dale, a ranch in the suburbs, made an exquisite exhibit of bouquets in vases and on stands, with a background of fan-palms, pepper-boughs and evergreens.

Mrs. Theodosia B. Shepherd brought by stage from Ventura a splendid exhibit, comprising 35 varieties of double monthly carnations, among them the charming Buttercup, Venus, Field of Gold, Calico, Fairy Princess, Petunia, Century, and the Shakespearean set. Among her seedlings was the "Mrs. Severance," named in honor of Caroline M. Severance of Los Angeles—carmine and silvery gray—a lovely contrast in color. She has two varieties of bouvardias, three of begonias, a large double white clematis, blossoms measuring nine inches across—the "Fairy Queen." Her roses were not fully ready for exhibition; she brought with her but 12 varieties. She has some fine blooms, large and full of fragrance. She exhibits also several colors of Grant Perfection stocks, flowers two inches across; some very large dark purple pansies; ten varieties of Lady Washington geraniums; a fine narcissus—the Emperor; six varieties of fuchsias, eight of abutilon, and two of calceolaria

Mr. Ford, the artist, had a fine display from his gardens at Carpinteria. There were laburnum; yellow, purple and white magnolia; purple pawlonia; scarlet clianthus; pyrethrum, deep pink—insect powder plant; romneya, the California tree poppy; the plumy white heath, and superb ivies in large vases.

Among the noticeable designs were a harp six feet high in red and white roses by Mrs. Sexton; a violin in pink and red by Mrs. A. C. Scull; a mitre in locust flowers and geraniums by Mrs. E. Neal; a horseshoe by Mrs. D. H. Pearson; a cornucopia in pink and red roses, a cradle in white flowers, and a floral piano formed of vari-colored roses and smilax, with keys of sweet alyssum and heliotrope.

Joseph Sexton's floral parlor, with its arched ceiling of the date-palm's slender fronds, was an elaborate, artistic structure, too complex in tasteful and bewitching appointments for us to do it justice in a dozen lines. Among the fruits, also, a most tempting display, including cherimoyas, or custard apples, loquats, oranges and lemons, came from the grounds of Mr. Sexton at Goleta.

John Spence, the florist, had a bank of roses 6½x3½ feet. He also exhibited 150 varieties of rose, every one labeled. Mrs. Oliver, of Mission Canyon, showed a number of choice and rare plants. Among the exhibits were specimens of Japanese wild rose, Cherokee rose, the papyrus or Nile flag, a shrub or tree of the Jolanum bearing an egg-shaped fruit, similar to the guava, and a fine assortment of citrus fruits in variety.

Many Eastern people were among the visitors—E. P. Roe, the well-known author, for one, was making a special study of the roses—and boundless was their wonder and delight.

Money Makers

Don't let golden opportunities pass unimproved; there are times in the lives of men when more money can be made rapidly and easily than otherwise can be earned by years of labor. Write Hallett & Co., Portland, Maine, who will send you, free, full particulars about work that you can do, and live at home, wherever you are located, at a profit of at least $5 to $25 daily. Some have made over $50 in a single day. All is new. You are started free. Capital not required. Either sex; all ages.

Short Hand

Taught thoroughly by mail. Terms reasonable. Send for circulars. Miss Barrett, 240 Montgomery St., S. F.

SOMETHING that has never failed to do all that was claimed for it—Le Roi des Savon—the King of Soaps.

Building Wisely and Well.

The Constitution of the Knights of Labor has been undergoing revision by a committee chosen at the last National Assembly of that Order. The following provisions are of general interest and command our approval:

The obstacles thrown in the way of promiscuous strikes will be greater than heretofore. Every local assembly must obtain permission from the district assembly to which it is attached before it can go on a strike. If a strike is inaugurated without such permission the penalty attached is that the charter shall be revoked. The same law applies to district assemblies. This will prevent strikes by local assemblies that have only been recently framed and know little or nothing about the organization and discipline.

The temperance feature in the organization will be more strongly enforced than ever before. Not only will liquor-dealers be prohibited from membership, but no local assembly will be allowed to have any social gathering or any picnic where liquor is sold, and no member will be allowed to dispense liquor for and in the name of an assembly. If such should occur the charter of the local assembly will be revoked and the members expelled. Transfer cards, by which a member transfers his membership in one local assembly to another, will not be given to members as heretofore, but sent direct to the secretary of the local assembly he desires to join. This prevents men who desire to go into the liquor business from taking their transfer cards, as has been done, and having them framed and hung behind the bar.

"AS ITHERS SEE US."—Under caption, "THE RURAL PRESS," a few days since the Merced *Argus* thus discoursed: "We understand that an agent for the above publica tion was in town the present week, but as he did not honor our office with a call, we cannot mention his name nor remark upon his success in getting subscribers; but we can speak of the RURAL PRESS and its advantages in a family over some of the sensational dailies of the city. If parents would put such reading matter into the hands of their sons and daughters as is found every week in the RURAL PRESS, it might save them many bitter hours of regret. The simplicity and purity of the matter does not detract one whit from the intelligent, educational qualities in which it abounds. Such reading instructs and enriches the mind and leaves it pure, while the sensational display of filthy and disgusting details of crime make them familiar with the dark and criminal side of life, which causes unrest, fills the mind with impurities and often leads to dissipation. There is something homelike and domestic about this publication that should recommend it to every home in the land."

Is Death Painless?

A Philadelphia doctor, after years of careful observation, says that our demise is as painless as our advent to the world. This is certainly reassuring; yet notwithstanding these great inducements, we still do not court death, and shall continue to use Dr. Pierce's infallible remedy, the "Golden Medical Discovery," for consumption, spitting of blood, shortness of breath, weak lungs, coughs, bronchitis, and kindred affections of the throat and chest. It is unequaled. By druggists.

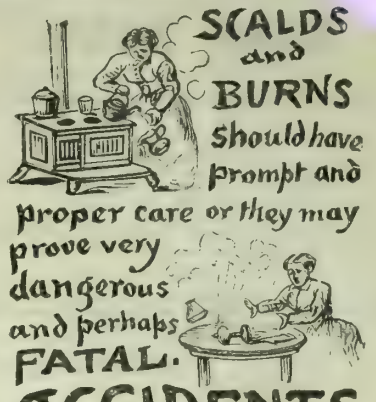
A Poor, Weak Sister,

Who is suffering from ailments peculiar to her sex, dreading to go to a physician, but knowing she needs medical help, will find, in Dr. Pierce's "Favorite Prescription," a preparation which will give her strength and new life through the restoration of all her organs to their natural and healthy action. It is the result of many years of study and practice by a thoroughly scientific physician, who has made these troubles a specialty. To be had of all druggists.

To break up colds and fevers, use early Dr. Pierce's Extract of Smart-Weed.

SQUIRREL AND GOPHER SMOKER.—We have received a very handsome and expressive chromo, setting forth the advantage of using F. E. Browne's squirrel and gopher smoker. According to the chromo, if a man uses the apparatus, he will have a fine house, be surrounded by heavy harvests, and look like a city banker. If he does not use it, he will live in a shanty and look like a tramp. A word to the wise is sufficient. The way to enjoy such benefits is to read Mr. Browne's advertisement in the RURAL.

First-Class Mowing Machine for Sale.

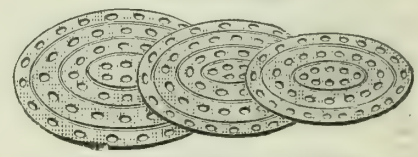


A brand-new mower of well-known make can be obtained cheap for cash by addressing D. F., Box 2361, San Francisco, Cal.

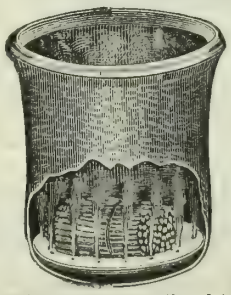
Liberal Religious Literature.

Views, Opinions, and Sentiments of Eminent Writers on Religion and its Relation to Man and Society. Address MISS HARRIET KELSEY, Sec'y, Unitarian Church, San Francisco. Correspondence invited.

Money Loaned



On Country Real Estate in large and small amounts, at lowest rates, by A. Schuller, 106 Leidesdorff St., room 3. **



HOLMES' KETTLE PLATES

A NEW INVENTION.

Saves their Cost in the Wear of Kettles in Three Months.

This Cut Shows Set of Three Plates.

This Cut represents the plate in use with asparagus cooking on it.

These plates will prevent all kinds of meats, vegetables, etc., from burning while cooking, even though the kettle boils dry. With two accompanying rings are a perfect substitute for a steamer or rice boiler, and can be put to a dozen other uses in the kitchen.

Price by mail, with full directions, 75 cents for the set of 5 pieces—three plates and two rings.

AGENTS WANTED in every County in the United States.

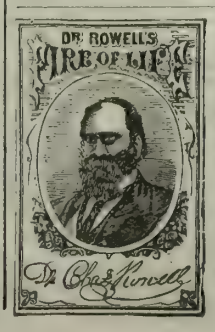
Ditson & Co's Sunday School Music

Ranks with the very best, and no Sunday School management should adopt a new Singing Book without carefully examining one of their "tried and true" Sunday School Song Books.

Voices of Praise (40 cts, $4.20 per doz.) Rev. C. L. Hutchins. Music and poetry dignified and classical, but not dull; in fact, bright and enthusiastic. Very large collection for the money.

Singing on the Way (35 cts, $3.60 per doz.) by Mrs. Jewett, ably assisted by Dr. Holbrook, whose noble compositions are known and loved in all the churches. This, like the book above mentioned, does excellently well for a Vestry Singing Book for prayer and praise meetings.

Songs of Promise (35 cts., $3 60 per doz.) J. H. Tenney and Rev. E. A. Hoffman—the first highly gifted, musically, and the second the author of many hymns of refined and beautiful quality. One of the newest books.



Song Worship (35 cts., $3.60 per doz.) L. O. Emerson and W. F. Sherwin, both celebrated compilers, composers and leaders, and the latter well known as having had charge of the music at many Chautauqua meetings.

For other good books, please send for lists and catalogues.

For a lovely little book for the young children of a Sunday School, look no further than FRESH FLOWERS (25 cents, $2.40 per doz.), Emma Pitt. Sweet Hymns, Sweet Music, Pretty Pictures.

☞Mailed for Retail Price.

CONSIGNMENTS SOLICITED. 324 Davis St., S. F.

Lands For Sale and To Let.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. **20,000** acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION. 401 California St., San Francisco.

20-ACRE TRACTS.

Fine, rolling, cleared, reddish-brown land, under cultivation in the Sha-ta Fruit and Raisin Colony. Twenty acres for $500. Terms: $200 cash, and balance in installments to suit purchaser, at 8 per cent per annum. Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired. Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

FOR SALE.

150 ACRES of New York Island, Suisun Bay, $2200. West's Island entire, near Antioch, about 200 acres, $3500. Also, Winter's Island entire, opposite Pittsburg and Collinsville, about 700 acres, with improvements, $12,000. All good for dairying, hog-raising, fruit culture, etc. Abundance of nutritious grasses all the year, and here stock survives the greatest freshets without levees. Would LEASE portions unoccupied, or EXCHANGE for good residence property.
WM. WINTER, 710 Capp St., S. F.

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, April 27, 1887.

Continued warm weather has forced growing vegetation and fruits well ahead, causing heavier deliveries of seasonable varieties than obtained last week. All advices report the crop prospects of fruit, root-vegetables, and gardenstuff in advance of last year. The cereal crop requires more rain, and in some sections, very soon. The wheat market at the East, and also in Liverpool, is gaining in strength, with higher prices obtained. The following is to-day's cable:

LONDON, April 27.—Cargoes off coast, firm; cargoes on passage and for shipment, firmly held, higher; Mark Lane, firmer; Cal. wheat off coast, 38s; Cal. wheat just shipped, 38s 9d; Cal. wheat nearly due, 37s 9d; French country market, generally dearer; Liverpool wheat, spot, hardening; Liverpool wheat, Cal. 7s 6d to 7s 9d; weather in England, cold for the season.

Foreign Review.

PARIS, April 23.—The wheat market is very firm, with good demand. Our requirements are 4,000,000 to 5,000,000 quarters.

LONDON, April 23.—The wheat market is steady, with a strong statistical position. Between this and harvest we require for consumption 11,000,000 quarters, of which our farmers can supply about 2,000,000, but the other 9,000,000 must either be imported or drawn from the slender stocks on hand. The millers have not yet recovered from the deluge of American flour in January, and are working short time all over the country. It is not surprising that they stubbornly resist the advance, but it is strange that they are able for so long to refrain from buying. Even if the whole Indian surplus, say 5,000,000 quarters, were to be shipped between this and the middle of May, we should still require all the wheat now on passage to carry us over till our own harvest, and part of the American visible supply as well.

LONDON, April 25.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: Supplies of native wheats are meager and values at provincial markets have risen 6d@1s. Sales of English wheat during the past week were 44,471 quarters at 32s 6d, against 32,512 quarters at 30s 11d during the corresponding week of last year. Foreign wheat is steadier and values are maintained. Flour is firmer. Corn is firmer. Fourteen wheat cargoes arrived; two cargoes were sold and two remained. The bulk has not yet been placed on sale. At to-day's market, wheat was steady. Business was limited. Foreign was rather firmer. Flour was in better demand at former prices. Corn was scarce and against buyers. Oats were 3d@6d dearer.

Eastern Wheat Markets.

NEW YORK, April 24.—Wheat has been active the past week, and at times the transactions were large and the fluctuations sharp, though generally within narrow limits. The export demand, largely for the continent, was good. Unfavorable crop reports from most of the winter wheat States, and a material reduction in the visible supply, were the chief elements of strength in the market. Spot closed ⅛@1⅛c higher and futures ⅜@¾c higher for the week.

CHICAGO, April 27—3 P. M.—Wheat was very weak again this afternoon, May declined to 81¾ and closed at 82. June closed at 82⅞. Large quantities were thrown on the market, and the excitement at times was sharp.

Crops at the East.

CHICAGO, April 24 —Following is the weekly crop summary of the *Farmers' Review:* The rains have materially improved the crop conditions in Kansas, Missouri, Kentucky, Illinois, and Indiana, and particularly the outlook for winter wheat; while in Iowa, Nebraska, Minnesota, and Dakota, the seeding of spring wheat has proceeded under generally favorable conditions. However, winter wheat, except in Missouri, is falling generally below that of last year. Very few counties of Ohio report prospects of an average crop. In Indiana the percentages of condition range higher and generally run from 85 to 90 per cent of an average. In Wisconsin the average of counties reporting this week ranges from 75 to 90 per cent. There have been fine rains throughout nearly all of Kansas, relieving the serious drought and improving the outlook for winter wheat. The average of the condition falls somewhat below that of last year. Reports from Iowa and Minnesota indicate that a full average acreage has been sown to spring wheat and an increase of acreage in Nebraska and Dakota.

New York Hop Market.

NEW YORK, April 24.— Hops—Quiet without change in any particular. All manner of reports come to hand with respect to the condition of the hopfields of this State, but they have no influence on the market in view of the generally slow demand.

Eastern Wool Markets.

BOSTON, April 23.—There has been a moderate demand during the week. Sales of all kinds were only 1,686,400 lbs. No change to notice in prices. The market remains steady. The improved tone is sustained and the opinion prevails that the bottom has been reached and no lower price need be expected on the new clip now coming in. There has been a fair demand for Territory wools, with sales of 871,000 lbs at previous prices. Fall Texas is in moderate demand with sales of 75,000 lbs at 18@19½c and 32,000 lbs on private terms. Oregon wool is quiet and steady. There have been sales of 25,000 lbs Eastern at 17@20c and 62,000 lbs Eastern on private terms. California wool is dull. Sales include 40,000 lbs spring and 71,500 lbs fall on private terms. There are large supplies of fall wool on the way here, which, probably, will arrive this week or next. Receipts of the week, 3060 bales domestic and 150 bales foreign.

NEW YORK, April 23.—The market has shown very little life through the week. Small lots have been picked up, but on the whole manufacturers have been indifferent, and buyers have had the advantage as to prices. The sales of the week included 10,000 lbs unwashed western at 31c; 60,000 lbs scoured Texas and Territory at 36@56c; 10,000 lbs Territory at 25c; 30,000 lbs Oregon at 20@22c; 25,000 lbs Montana at 21c; and 25,000 lbs spring California on private terms.

California Fruit in Chicago.

CHICAGO, April 23.—Lemons are firm, with a fair supply on hand. California varieties are rather slow of sale, being smutty, at $2 25@3 ₩ box. The supply of California oranges is fair. Choice sells fairly well and rules steady, but common and smutty varieties are dull and easy. Bright Riversides are quoted at $3.50@4; San Bernardino, $3.50@4.25; Santa Ana, $3@3.25; St. Michael paper-rind, $3.75@4; Orange, $2.50@3; Los Angeles, $2.75@3.25; Navel oranges, according to quality, $5@6; Duarte, $3@3.50; San Gabriel, $2.75@3; Blood oranges, fancy, $5@7; culls, $2.

Dried Fruit—Sun-dried apples remain very slow and easy. Evaporated are rather scarce and firm. There are no peaches in stock, excepting old, and they are dull, but choice new could be sold. California dried fruit rules steady. The demand is fair and stocks are rather light. Prunes, French, ₩ lb, 8@9¼c; plums, pitted, 10@11c; peaches, halves, 11@12½c; do halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London Layers, 20-lb boxes, ₩ box, $1.40@1.50; raisins, loose, Muscatel, ₩ box, $1.20@1.30; raisins, California Layers, ₩ box, $1.25@1.35.

Dried Fruit and Canned Goods East.

NEW YORK, April 24.—Canned Goods—In a jobbing way a moderate demand is reported, but interest in round lots is lacking. Peas have sold more freely. Corn is in fair demand. Fruit remains quiet. California canned peaches, $2.25@2.50; pears, $2.50@2.75; plums, $1.85@2; grapes, $1.75@2; apricots, $2.10@2.25.

Dried Fruit—Raisins quiet and prices steady. California loose Muscatel, two-crown, $1.25@1.30; do three-crown, $1.50@1.60; do Londons, $1.50@1.70. Prunes—Turkish, quiet; prime stock held at 4½c; Bohemian, more doing at 3¼c; French, firmer at 6¾@7¼c. Currants—The demand is fair at 4⅞c. Citron—Leghorn, 16¾@17c.

California Products at New York.

NEW YORK, April 24.—Beans—The stock of California lima beans is running very low and with a continued fair inquiry the prices are advancing, the quotations to-day being $1.85.

Seeds—California yellow mustard quoted at 4¼c.

Local Markets.

BAGS—The demand is slow, with heavy importations from Calcutta nearly due. Standard size is nominally at 5⅝@6 cts.

BARLEY—There has been more activity in the market the past week than at any time this year, with heavy sales on Call at advancing prices. It is claimed that there is a large short interest out. To-day's sales on Call are reported as follows:

Morning Session: Buyer season — 100 tons, $1.18½; 100, $1.18⅝; 100, $1.17⅞. Buyer 1887—100 tons, $1.24¾; 100, $1.23¾; 200, $1.23⅝. Seller 1887—300 tons, $1.09½; 200, $1.09; 100, $1.08¾ ₩ ctl. Afternoon Session: Buyer season—100 tons, $1.17½. Buyer 1887—100 tons, $1.23⅞ ₩ ctl.

BUTTER—The market, which was slightly easier, closes stronger, under a good demand and lighter receipts. Free purchases have been made for packing, to fill distant orders.

EGGS—The market is stronger, with strictly choice fetching an advance, owing to light supplies and a good demand. The stock of Eastern is lighter.

CHEESE—Owing to freer receipts the market closed easier, with concessions of ½ ct ₩ lb, made to effect quick sales

FLOUR—The market is very strong, with another advance expected at an early day. The consumption is increasing.

WHEAT—The market has been gaining in strength throughout the week, not only here but also in the East and in Europe. The advance is due, to a very great extent, to the large syndicate of capitalists controlling the available stocks, and also to a large short interest here, at Chicago and New York. Many of the short sellers are reported to be large operators in England and Scotland. About all the supplies in this State are held against sales on Call. To show the strong situation in this city we give the following: A farmer had in store, at Port Costa, 200 tons of fair wheat for which the highest bid two months ago was $1.37½, and to-day he sold at $1.77½. It is uncertain how high prices will go on Call, but there is one thing quite certain, the short interests will be made to fill, even if a much higher range in options is reached. The following are to-day's sales:

Morning session:—Spot, season's storage paid—400 tons, $1.83½. Buyer season—600 tons, $1.92; 100, $1.91½; 100, $1.91⅜. May—100 tons, $1.84. July—100 tons, $1.85; 100, $1.84½. Buyer 1887—400 tons, $2.05⅜; 100, $2.05¼; 200, $2.05⅛. Seller 1887—300 tons, $1.75⅛; 2500, $1.75; 200, $1.74⅞; 700, $1.74¾ ₩ ctl. Afternoon session: Spot, season's storage paid—100 tons, $1.83. Buyer season—300 tons, $1.90; 400, $1.90¾. July—500 tons, $1.83¾. Buyer 1887—200 tons, $2.04½; 100, $2.04⅜; 800, $2.04¼. Seller 1887—1100 tons, $1.74; 600, $1.74⅛; 1000, $1.74¼; 600, $1.74½ ₩ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

The wheat market made a sudden jump on Monday of 2½ cts ₩ ctl on Call for buyer options. The advance was occasioned chiefly by the shorts buying. The present deal has been well handled for a success, but then it could not have been otherwise, backed as it was with almost unlimited capital and the statistical position of the cereal favorable for a strong bull movement. These statistics have been given almost every week for fully two months, in this department. It is claimed that unless the heavy shorts fill soon, prices will go still higher, not only here but in Chicago, New York, and also in Liverpool. Several thousand tons of No. 1 shipping were sold for actual delivery on Call at about $1.80, season storage paid.

In the sample market very little trading is reported, owing to the bulk of the grain being held against short sales on Call. That this theory is probably correct is admitted by many, owing to the large manipulator of futures loading a ship here for U. K. Oregon wheat instead of Californian.

Crop advices report that rains are required in Fresno, Tulare, and Merced counties, and also in parts of Stanislaus, San Joaquin, and the more central counties. The prospect, without rains soon, is rather discouraging for more than half a crop in several of the counties, and only an average in the others.

Late European advices do not report any material change in the wheat situation. Crops in Great Britain and on the Continent continue favorable, but the stock of grain, for the season, is very small. England will have to import, aside from the quantity afloat, fully 56,000,000 bushels from April 9 to August 31, 1887. France will also have to import very heavily, notwithstanding the high duties. The British Indian wheat crop of 1885–86 was 258,333,081 bushels from 27,392,792 acres area, and 302,000,000 bushels in 1884–85. The crop of 1886–87, just harvested (second report of the Indian Bureau of Agriculture the first week in March, to be followed by final report the first week in May next), indicates an output of about 231,000,000 bushels. The exports from India in 1886 were 43,160,000 bushels of wheat, which about exhausted the reserves and the crop of 1885–86. On this basis it is not probable that the exports to the end of March 31, 1888, will exceed 30,000,000 bushels, and may not be much more than 25,000,000 bushels.

The wheat and flour exports from the United States, from July 1 to April 10, 1886–87, have been, from both coasts, 121,799,214 bushels. The available export surplus in the country April 10, 1887, as per the government crop report and accepted calculations as to consumption, is about 26,000,000 bushels, besides 50,000,000 bushels minimum reserve. Late Eastern advices report good results from the rains of last week, but still the average outlook is below last year's at this time. All advices are confirmatory of that given last week, viz., a lessened acreage and the general crop outlook below an average. The prediction made in this department that barley was being manipulated on Call for a deal, is being verified. The stock in the State is not large for the season and under good control, while the crop outlook is not favorable for more than 60 or 70 per cent of the aggregate yield last year. The consumption is increasing.

Oats have been coming in more freely from the North, causing a weak market, owing to dealers and consumers buying as little as they can. Oregon and Puget Sound crop advices continue favorable.

Corn is firm, with a fair trade call for season.

Fruits.

The first cherries of the season were received last Monday and sold at 75 cts and $1 ₩ lb. They were received from J. M. Bassford, Jr., and G. H. Peabody, of Vacaville. Since then receipts have been more free. The crop this year is said to be very large.

The first gooseberries of the season were received on Friday last. A. Murphy of San Leandro shipped them. They sold at 10 cts ₩ lb.

Strawberries are coming in more freely and sell for less money. Raspberries are not coming forward freely, consequently they still fetch high prices.

Apples are neglected and sell slowly.

Oranges for local trade are slow, but there is a good demand for the mining sections and also up North.

Lemons are in good supply, but limes are scarce.

In dried fruits the market is very strong, with an advance in California French prunes and also in evaporated apples.

Raisins are steady, with a firm tone reported. The stock is not large for the season.

Live-Stock.

The consumption of meats is light, with butchers only buying from a hand-to-mouth way, owing to the hot weather. Beef cattle continue to be offered freely, with sales made at a still lower range. Mutton sheep are also in liberal supply, but they have freer sales than bullocks. Hogs are steady under light receipts. Calves and milch cows are unchanged. Draft horses are offering more freely, but no lower prices are given. There is a better inquiry for roadsters and general utility horses. Matched spans of carriage horses have ready sale.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8¼@8½c; first grade, grass fed, 7¾@8c per lb.; second grade, 7@—c; third grade, 6¼@7c.

MUTTON—Ewes, 6½; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8½c; small, 5@8c.

PORK—Live hogs, 4¾@5¼c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5¼c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Feedstuff.

Hay is easier for off grades, under freer supplies. The consumption is quite large throughout the State. Several carloads of choice were sold at a slight advance on our top quotations.

Bran and middlings are higher, and as barley is advancing, ground barley will also be marked up. In other ground feed there are no changes to note.

Vegetables.

New potatoes are in fair supply, with the quality improving. The crop promises to be very large. Old potatoes are steady at full figures under a good trade call.

Onions are weak at a decline, owing to the nearby trade taking more freely of new.

Asparagus and peas continue in liberal supply at low prices. Rhubarb is scarce. String beans, tomatoes and other seasonable vegetables are coming in more freely, causing shading in prices. The crop of all kinds is quite large.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	221,426	243,592
In port, disengaged	124,467	39,687
In port, engaged	3,862	32,276
Totals	349,755	315,555

The above gives a carrying capacity as follows: 1887, 545,238 short tons; 1886, 470,582 short tons; increase over last year, 74,656.

Hops are stronger under a good demand, with light stocks to draw from. Present advices from the crops on this coast are favorable

Wool has moved more freely, but the sales made were chiefly clips that were forced on the market. Large growers of choice wools are not offering their clips, believing that a lower range of freights may cause better prices.

Beans are steady, with a firm tone reported. Poultry, under moderate receipts and a fair call, ruled steady throughout the week.

Hams and bacon are firm, with a good trade sale reported.

Honey continues to hold to strong prices.

San Francisco, April 27, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING APRIL 19, 1887.

361,390.—RIVET—M. Arnold, S. F.
361,358.—NUTRITIVE TONIC—Wm. Henley, Alameda, Cal.
361,360.—WOVEN FABRIC—R. H. H. Hunt, S. F.
361,532.—MITER-BEVEL—L. H. Lewis, San Jose, Cal.
361,367.—TREATING NIGHT-SOIL—R. W. E. Mac Ivor, Sydney, New South Wales.
361,473.—LASTING MACHINE—S. N. Washburn, Union, Oregon.
361,663.—ELECTRIC ARC LAMP—G. A. Wiese, S. F.
361,341.—VELOCIPEDE MOTOR—J. Witt, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order): American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Fresno Agency.

Mr. William Pool, an active and enterprising citizen of Fresno county, has accepted an agency for all the publications issued from this office, and for securing subscriptions and advertisements for the same; also for receiving orders for engravings. Our friends in that section will place us under obligations by aiding him in his efforts in obtaining information for our columns, and in his business efforts for our papers.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.
GEO. MCDOWELL—Tulare Co.
T. P. POWERS—Napa and Sonoma Cos.
A. J. HARE—El Dorado Co.
J. L. DOYLE—Mariposa Co.
W. J. FREEMAN—Yolo Co.
CHAS. LIST—Alameda Co.
T C. STARR—San Bernardino Co.
S. J. LITTLEFIELD—San Diego Co.

LIVE-STOCK SALE.—Many readers will be interested in the announcement in our advertising columns of a sale of Ayrshire cattle, horses, and Southdown sheep, by George Bement, the well-known breeder. Mr. Bement is an old breeder of Ayrshires and his love of live stock has also led him into other lines as well. His Ayrshire herd and Southdown flock include a number of prize-takers at the fairs. Killip & Co. will preside at the sale, which will take place on Thursday, May 12th. Full particulars of the sale may be found in the advertisement.

JERSEY CATTLE SALE.—A Jersey sale which should attract wide attention is that announced by Killip & Co. on page 390 of this issue. The sale is of registered Jerseys at Far Niente farm near Oakville station in Napa county. This band of Jerseys is a good one, and the trip to Oakville, in the heart of the Napa valley, is a delightful one. Catalogues can soon be had on application to the auctioneers at 22 Montgomery St., S. F.

WALTER J. FREEMAN, representative of the PACIFIC RURAL PRESS, was in town last week. He is a good business man and the paper he represents is the best of its class in the West—one which every farmer and vineyardist should have at his home. The PRESS has done and is doing a great deal of good for the ranchmen of this State. Subscribe for it and make your family as well as yourself happy.—*Lake Co. Avalanche.*

COTTON-SEED AND CACTUS FOR BEEF.—It is said that a trainload of 330 cattle, from Cotulla, Texas, which had been fattened on prickly pear and cottonseed meal, was lately marketed in Chicago. They attracted considerable attention, being the first large lot of cattle ever fed that way for market, and were sold at $4.25 per cwt.

"NATURAL LAW IN THE BUSINESS WORLD." This book by Henry Wood (Charles T. Dillingham) has just been issued by Lee & Shepard, Boston. It is an effort to apply natural law to the live social and economic questions of the hour. We would like to see a copy in the hands of every employer and employe.

TRUSTEES OF THE NORTHERN NORMAL SCHOOL.—Governor Bartlett has appointed the following trustees of the Northern California State Normal School: Gen. John Bidwell, F. C. Lusk, James W. B. Montgomery, A. H. Crew, and L. H. McIntosh, all of Butte county.

A DISPATCH from Guaymas to Health Officer Mears, of this city, states that there is no truth in the report of cholera at that place, and that there are no known cases of the disease at any points on the Mexican coast.

STATE BOARD OF SILK CULTURE.—The Governor has appointed the following members of the State Board of Silk Culture: E. W. Hilgard, Alameda; J. J. Rivers, Alameda; J. B. Mills, San Francisco.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Books for the Household.

We desire to give our readers every advantage in obtaining useful books at the most favorable rates attainable. We offer below a number which we believe will be found acceptable to many readers of the RURAL, and the reduced prices at which we can furnish them to our cash-in-advance subscribers—POSTPAID—will place them within the reach of many.

WHAT EVERY ONE SHOULD KNOW.—A Cyclopedia of practical information. Gives full directions for making and doing over 5000 things necessary in business, the shop, the farm, the kitchen and the home. Recipes, prescriptions, trade secrets, law, art work, agriculture, etc. Compiled from the most reliable sources and alphabetically arranged by S. H. Burt. 510 pages, cloth. Postpaid 50 cents. Regular price, $1.

THE WAY TO DO MAGIC.—Illustrated. Plain directions to enable any one to become proficient in Jugglery and Legerdemain. 60 pages. Postpaid, 10 cents.

THE TAXIDERMIST'S MANUAL.—Illustrated. How to Collect, Prepare, Mount and Preserve all kinds of Beasts, Birds, Insects, etc. By Prof. Graham Allen. 64 pages. Postpaid, 10 cents.

KNITTING AND CROCHET.—A Guide to the Use of the Needle and the Hook. Edited by Mrs. Croly (Jenny June). 144 pages, 200 illustrations. Postpaid, 25 cents. Regular price, 50 cents.

NEEDLE-WORK.—A Manual of Stitches and Studies in Embroidery and Drawn Work. Edited by Mrs. Croly (Jenny June). 126 pages, 200 illustrations. Postpaid, 25 cents. Regular price, 50 cents.

LADIES' FANCY-WORK.—A Manual of Designs and Instructions in all kinds of Needle-Work, embracing Embroidery, Kensington, Lace-Work, Tatting, Net-Work, Wax Flowers, Painting on Silk, etc. Edited by Jenny June. 152 pages, 700 illustrations. 25 cents, postpaid. Regular price, 50 cents.

Steam Engine Catechism.

A SERIES OF DIRECT PRACTICAL ANSWERS TO DIRECT PRACTICAL QUESTIONS—MAINLY INTENDED FOR YOUNG ENGINEERS AND FOR EXAMINATION QUESTIONS.

—BY—

ROBERT GRIMSHAW, M. E.

This book is intended to answer not only "such direct questions as have been asked by both theoretical and practical men," but "questions chosen with the view of saving the reader a long search after some point, and enabling him to get directly at the information desired." Formulas and mathematical gymnastics are avoided. While the book is not written for professional men, it is technically correct and up to date. Published in two parts. Price of each part, $1, postpaid.

Part II of the STEAM ENGINE CATECHISM contains answers to further practical inquiries received since the issue of the first volume. Sold by

DEWEY & CO.,
220 Market St., S. F.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.33 "
Pota-h	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California**. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article**, and as such returns the user a better money value than a low-grade fertilizer. It **is especially well** adapted to use in **California**, on account of the **predominance** in it of **Phosphoric Acid**, which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia**, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

ARCTIC OIL WORKS,

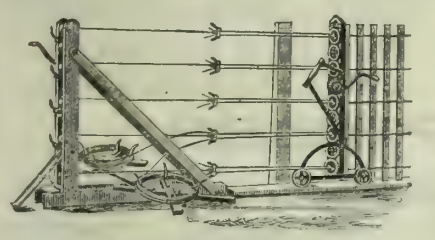
Manufacturers of

INSECTICIDE!

FOR ERADICATING AND DESTROYING ALL PESTS THAT INFEST FRUIT TREES AND PLANTS, SUCH AS

SCALE BUG, HARVEST FLIES, TREE HOPPERS, PLANT LICE, Etc.

It has been fully tested by the Agricultural Department of the State University, and pronounced a success, the endorsement of which we append. It is put up in convenient forms for use both in liquid and paste state.



For Sale in Barrels and 2 and 5-pound Cans in paste form, and in Barrels and 5-gallon Cans in liquid form.

Copy of Letter Received from the University of California, College of Agriculture, Berkeley, dated December 4, 1886.

J. N. KNOWLES, Esq., Manager Arctic Oil Works, San Francisco—DEAR SIR: We have lately tested the Insecticide preparation of Whale-Oil Soap sent by you to us, and have found it to be very effectual against the Scale infesting Orange and Bay Trees here; also against the Thrips. From our previous experience with a similar composition, I think it will be found fully effectual against any small Insect Pests not specially protected like some of the armored Scales, and against which any Wash short of strong lye cannot be used. Respectfully,

E. W. HILGARD, Professor of State University.

OFFICE, 28 California St., San Francisco, Cal.

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

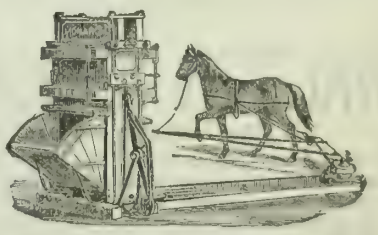
HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



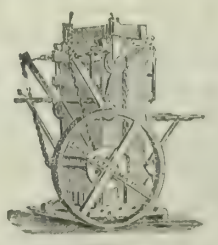
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**



THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**

—THE—

Genuine Price Petaluma,

With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., **$350.**

☞Send for large illustrated Catalogue of above presses. **Office and Factory, SAN LEANDRO, CAL.** Address

HAY PRESSES OF EVERY DESCRIPTION.

THIS PRESS

Does Its Own Tramping.

DOES NOT GRIND OR PULVERIZE THE HAY.

RECORD.

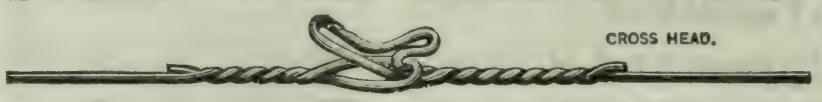
Tons (266 Bales) in 1 day
105 Tons in 3½ days.
136 Tons in a week.
20 Tons per day for weeks together.
2350 Tons in one season.

SELF-TRAMPING JUNIOR MONARCH HAY PRESS,

With the New Automatic Horse Power

PRICE, COMPLETE, $500.

The fastest Press ever put in a hay field. It has unlimited power and sufficient strength to make the bales as heavy as a rope will stand; and if wire is used, it will take less per ton; hence a saving in this direction.



A remarkable improvement called the IMPROVED AUTOMATIC HORSE POWER has been applied to the Junior Monarch Hay Press, which increased its speed FIVE TONS PER DAY and saved the labor of one man.

THE MONARCH HAY PRESS, which puts 10 tons in a box car, is still sold at $600.

JUNIOR MONARCH HAY PRESS.

(The above cut does not show recent improvements.)

STEEL WIRE BALING TIES.

Cheaper than Wire—Better than Rope.

Experience will teach that the same number of tons of hay can be more safely secured, and at less cost, by our prepared ties than by the use of coil wire. In the use of coil wire, one or two sizes larger is required, and then the wire is not reliable at the fastenings; add to this the bother and loss of time in its use, the loss of wire, cost of re pressing, and loss of hay in transit and in the market by reason of broken bales, and we are certain coil wire cannot be economically used.

Why waste time making ties in the field when you can buy them ready made almost as cheap as the wire in the coil? We have on hand a large quantity of steel bale ties, ready for immediate delivery, which we will sell at the following prices:

No. 14 Wire, 6½ feet long, for Monarch Press, per hundred	$ 88
No. 14 Wire, 8 feet long, for Junior Monarch Press, per hundred	1 06
No. 14 Wire, 8 feet 3 inches long, for Dederick or Economy Press, per hundred	1 09
No. 14 Wire, 8 feet 6 inches long, for Dederick 17x12, per hundred	1 12
No. 14 Wire, 8 feet 9 inches long, for Dederick or Economy Press, per hundred	1 15
No. 14 Wire, 9 feet long, for Petaluma Press, per hundred	1 17
No. 14 Wire, 9 feet 3 inches long, for Dederick or Economy Press, per hundred	1 20
No. 14 Wire, 9 feet 6 inches long, for Dederick or Economy Press, per hundred	1 23

This Price Will Hold Good for 15 Days.

The PETALUMA and CLIMAX PRESSES, Greatly Improved for 1887.

THE CELEBRATED

Petaluma Baling Press.

Weight, 2600 lbs. Price $350 delivered at the factory. Size of bale, 22x22x48 inches. Capacity 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

CLIMAX HAY PRESS.

$300 00

Weight 2200 lbs. A crew of three men—four can be used to advantage.

Five ropes are used on the bales. Capacity 10 to 15 tons per day. The best press for the money in the world. Address

We are the only manufacturers of Baling Presses in San Francisco. Baling Wire, Baling Ties and Rope at the very lowest prices. ADDRESS

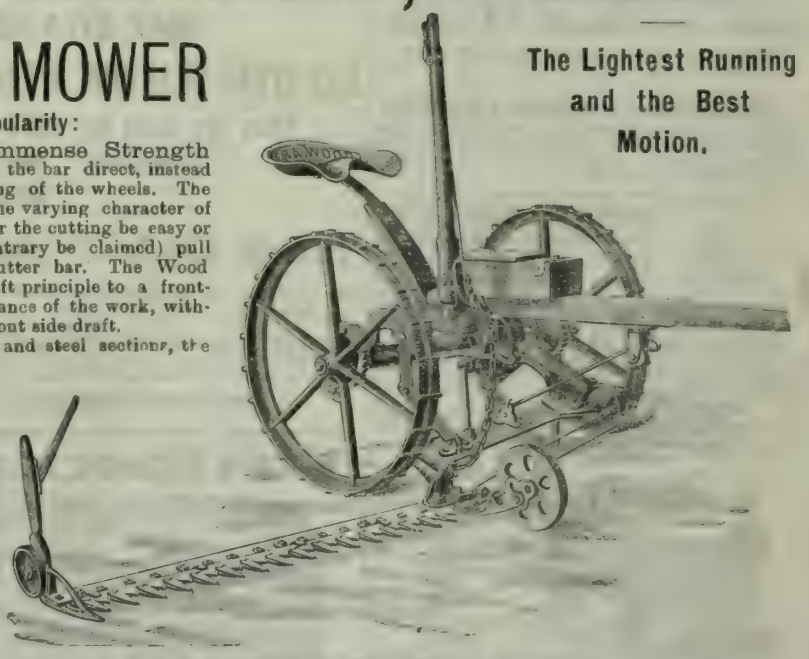
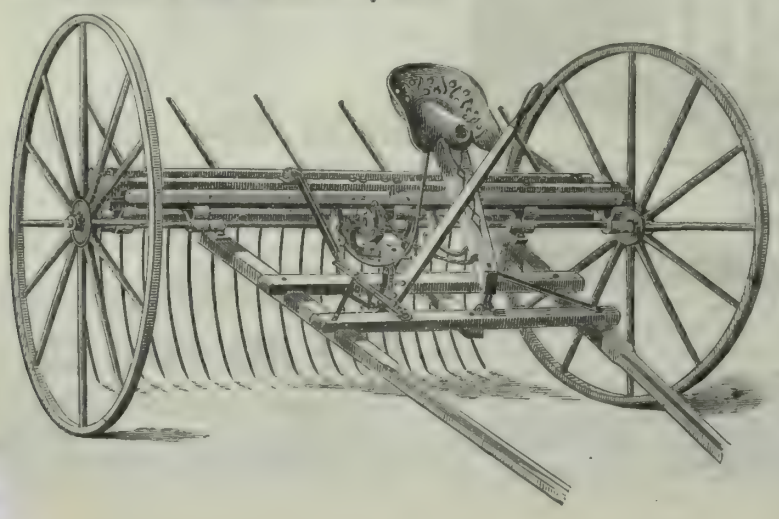
—GENERAL AGENTS FOR—

WALTER A. WOOD INCLOSED-GEAR MOWER



The Following Very Important Special Characteristics Contribute to Its Popularity:



Steel and Malleable Iron used wherever they can be employed with advantage. Its Immense Strength united with Lightness. Its Simplicity. With its unequaled underdraft device the horses pull on the bar direct, instead of wholly or partly pushing it ahead of the wheels, as in other front-cut mowers, and there is no slipping of the wheels. The draft action used on the Wood is the only one ever devised that accommodates itself with exactness to the varying character of grass and ground. All other methods for easing up on the cutter-bar act with a dead uniformity whether the cutting be easy or difficult, and thus interfere more or less with the proper "float" of the bar. All of them (though the contrary be claimed) pull down on pole and horses' necks, WHEN CUTTING, just in proportion to the amount eased up on the cutter bar. The Wood draft arrangement is the only one that pulls exclusively from the cutters. It applies the only correct draft principle to a front-cut floating-bar mower. It eases the bar automatically in proportion to the pull by the team and resistance of the work, without causing neck-weight, permitting the bar to lightly follow the surface of the ground at all times, without side draft.

Cutting apparatus of best construction—malleable guards bolted to the bar; steel guard plates and steel sections, the sections running on steel at both heel and point.

Wider thread and higher wheels than other mowers. The machine clears higher obstructions between the wheels than other mowers, owing to the high axle and hinged frame. All bearings carried in one perfectly rigid frame, keeping them perfectly lined for any length of time. Brass Boxing, Protected Pitman, Incased Gearing, Lock Nuts. Weight of machine and driver properly distributed on both wheels and balanced on the axle. No side-draft. No neck-weight. Perfected Shifter, without wear, and starting the knife instantaneously when the wheels move. Lightest draft and most comfortable to ride of any mower in the world. Its general advantages are the union of strength, lightness and simplicity, the proper distribution of weight, ease and steadiness of running, absolute reliability as a cutter of any and all grasses. Combining so many good qualities, it is world-renowned, and commands the first choice of the farmers everywhere.

The Lightest Running and the Best Motion.

THE THOMAS RAKE! THE ROYAL SELF-DUMP RAKE! COATES' LOCK LEVER RAKE!

Well known on the Coast and each unequaled in its class. THE THOMAS, the most popular in the market, is strong and durable. Is comfortable for the driver and easy to operate. Is adapted for all kinds of work and ground. In dumping, its over-hanging cleaner brings the green hay on top. Its teeth will not break with ordinary usage, and it is the best and most desirable rake for the money in the market.

THE ROYAL SELF-DUMP RAKE can be operated by a boy or girl. It is perfect in action, does not get out of repair, and will give better satisfaction than any other self-dump rake made.

THE COATES LOCK LEVER RAKE, the simplest made, is never out of repair, and is easy to handle. It has a spring seat, oil tempered teeth, and with it you can save enough grain from twenty-five acres of stubble to pay for the rake.

A Complete Assortment of Buggies, Phaetons, Carts, Buckboards, Harness, Etc.
